Duluth Ore Dock is the Largest in the World, W. H. Hoyt. Ry. Age, vol. 67, no. 8, Aug. 22, 1919, pp. 345-348, 9 figs. Dock has length of 2438 ft. and is 84 ft. above water. It has electric-light masts reaching to 120 ft. above water. Reinforced-concrete slab used for foundation.

Pearl Harbor Dry Dock

Completion of the Pearl Harbor Dry Dock, A. Russell Bond. Sci. Am., vol. 121, no. 9, Aug. 30, 1919, pp. 202-203, 11 figs. Method of construction necessitated by reason of peculiar geological conditions.

Unique Construction of Pearl Harbor Graving Dock. Contracting, vol. 9, no. 3, Aug. 1, 1919, pp. 77-79, 9 figs. Transverse floor sections built and floated to site in dry dock.

Portsmouth Navy Yard Dock

World's Largest Dry Dock Completed at Portsmouth Navy Yard at Cost of $4,000,000. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 42-43, 1 fig. Basin is 1022 ft. in length; width of coping lines is 144 ft. and width of floor bottom 112 ft.

Purfleet Jetty and Viaduct

Purfleet Jetty and Viaduct. Ferro-Concrete, vol. 10, no. 12, June 1919, pp. 355-364, 11 figs. Structure equipped with cranes for discharging collier steamships. Total river frontage is 586 ft. in length.

HYDRAULIC ENGINEERING

Flood Water

Concrete Channel for Stream Over Fractured Mine Outcrop, Harley A. Coy. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 327-328, 3 figs. Flood water which formerly backed up creek and seeped through into mine below is now carried past broken ground.

See also Storm Water.

River Banks Erosion

The Causes of Erosion of River Banks, Col. Hoc. Eng. & Contracting, vol. 52, no. 5, July 30, 1919, pp. 123-125, 9 figs. Tendency of river to assume sinuous course explained by analysis that curve of current of liquid is like bending of loaded flexible column. Translated from Génie Civil.

River Banks Protection

Protecting the Banks of Savannah River Through Augusta, E. C. Garvin. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 410-412, 1 fig. Development of methods used and data on cost of rock face revetment placed in pre-war and war years.

Sand in Suspension

The Determination of the Amount of Sand in Suspension in Water, G. J. Gibbs. Central (Jl. of Old Students of City and Guilds Eng. Col., Lond.), vol. 16, no. 45, June 1919, pp. 13-20, 2 figs. Method for ascertaining amount of sand carried in suspension by running water, developed as part of problem of dealing with growth and disappearance of sand banks in estuary of river.

Storm Water

Graphical Method for Estimating Storm-Water Run-Off, Ralph W. Horner. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, p. 282, 1 fig. Graph constructed from formula $Q = ciA$ where Q is total run-off, c run-off coefficient of area, i intensity of rainfall, and A drainage area.

Water Storage

The General Principles of the Development and storage of Water for Electrical Purposes, J. W. Meares. Jl. Instn. Elec. Engrs., vol. 57, no. 283, June 1919, pp. 426-439, 8 figs. Also Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 222-224, 5 figs. Examines subject from view point of delivering, and continuing to deliver, water to prime mover. Collection, storage and delivery of water on high, medium and low falls are discussed.

MATERIALS OF CONSTRUCTION

Gravel

See Sand and Gravel.

Road Making Materials, Sampling

Instructions Governing the Sampling and Inspection of Road Making Materials in New Jersey, William G. Thompson. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 66-69. Prepared by State Highway Engineers.

Sand and Gravel

Properties of Sand and Gravel, A. Ledoux. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 21-26, 4 figs. Morphological and physical; also tabulated results of granular metric analysis showing difference in percentage of fineness between several grades of sand and gravel.

MUNICIPAL ENGINEERING

Boston

Replanning Boston's Most Congested District, Elisabeth M. Herlihy. Am. City, City Edition, vol. 21, no. 2, Aug. 1919, pp. 107-112, 5 figs. Recommendations of Boston City Planning Board for providing right living conditions in "North End."

City Planning

See also Portland.

Niagara District

Regional Planning of the Niagara District, Thomas Adams. Can. Engr., vol. 37, no. 5, July 31, 1919, pp. 187-189. Future purposes of industrial development, sub-division of land, housing, transportation, sources and distribution of power, water supplies and sewerage, and general amenities. Address at Nat. City Planning Conference.

Portland

City Planning for Portland. Mun. Jl. & Public Works, vol. 47, no. 8, Aug. 23, 1919, pp. 116-118, 5 figs. Zone plans for several districts prepared by City Commission. (To be continued.)

Water Rates

Water Rates and Fire Protection Charges. Mun. Jl. & Public Works, vol. 47, nos. 5-6, Aug. 2 & 9, 1919, pp. 70-72 & 88-90. Data from several hundred cities of United States; maximum and minimum rates; changes since before the war; receipts for public hydrants and private fire protection. (To be continued.)

RECLAMATION AND IRRIGATION

Drainage Plant, Codigoro

The New Drainage Plant at Codigoro (Die neue Entwässerungs-Anlage in Codigoro), G. Müller. Schweizerische Bauzeitung, vol. 74, no. 2, July 12, 1919, pp. 14-16, 7 figs. Reinforcing the substructure for the new boiler and machine house; new pumping station. (To be continued.)

Lindsay-Strathmore Irrigation District

Construction Details of the Lindsay-Strathmore Irrigation District, California, E. Court Eaton. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 348-351, 6 figs. Cement-lined canals and wood and asphaltum-impregnated felt-covered steel pipe lines used.

Miami Flood Works

Miami Flood Works Involve Radical Railway Changes. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 313-315, 4 figs. Railways crossing flood-retarding basins shifted to high ground. Levees guard stretches crossing low-lying areas.

Naches-Selah Irrigation Canal

Reconstruction of the Naches-Selah Irrigation Canal, Elbert M. Chandler. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 276-279, 4 figs. Parts of old sidehill canal in disrepair replaced, under war conditions, by concrete-lined tunnels, reinforced-concrete flumes, and canal with wire-reinforced concrete.

ROADS AND PAVEMENTS

Asphaltic Pavements

Asphaltic Pavements at Ashokan, R. R. Barrett. Good Roads, vol. 18, no. 8, Aug. 20, 1919, pp. 95-96, 3 figs. Method employed in applying asphalt cement for the seal coat of bituminous-concrete roads.

Canada

Progressive Method of Road Improvement, Gabriel Henry. Can. Engr., vol. 37, no. 6, Aug. 7, 1919, pp. 203-206. Points out advantages of adopting this method in Province of Quebec. Paper read before Can. Good Roads Assn.

Concrete Roads

Stresses in Concrete Road Slabs from Wheels of Heavy Trucks, A. T. Goldbeck. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, pp. 165-166. Conclusions from tests conducted by U. S. Bur. of Public Roads.

See also Standard Details.

A Study of Aggregates in Concrete Paving, R. W. Scherer. Cement & Eng. News, vol. 31, no. 8, Aug. 1919, pp. 32-33, 3 figs. Opinions expressed by various investigators and engineers having had experience in road building.

Convicts

Convicts on Road Work. Mun. Jl. & Public Works, vol. 47, no. 5, Aug. 2, 1919, pp. 64-67, 4 figs. Experience with use of convicts in States of Arizona, Florida, Idaho, Illinois, Louisiana, Maryland, Nebraska, New Jersey, Oklahoma, Rhode Island, Utah, West Virginia, and Wyoming.

France

Some Lessons from French Roads, E. A. Kingsley. Mun. Jl. & Public Works, vol. 47, no. 6, Aug. 9, 1919, pp. 82-85. Bituminous treatment claimed to have proven beneficial.

Grade Crossing Elimination

Civic and Engineering Features of Grade Crossing Elimination, Allen L. Golinkin. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 61-63, 1 fig. Suggested sections for railway track-depression scheme permits passengers an unobstructed view to original ground level.

Granite

Paving of Streets and Aisles, Brooklyn Army Supply Base. Eng. News-Rec., vol. 83, Aug. 28, 1919, pp. 400-402. Granite used for heavy traffic, asphalt blocks for medium and special construction, and bitulithic for light traffic.

Guards

Steel Paving Guards, Chas. F. Puff, Jr. Am. City, Town & Country Ed., vol. 21, no. 2, Aug. 1919, pp. 141-142; also Am. City, City Ed., vol. 21, no. 2, Aug. 1919, pp. 141-142, 1 fig. Results of two years' experience in Philadelphia mentioned as evidence that guard used as edge protection is direct success.

Highways Transport Committee

Highways Transport Committee for New York. Good Roads, vol. 18, no. 6, Aug. 6, 1917, pp. 77-78. Text of Reconstruction Commission's report recommending establishment of

a State Highways Transport Committee to promote marketing of farm produce by rural motor express.

Macadam Roads

Construction of Water-Bound Macadam Roads, A. Paradis. Can. Engr., vol. 37, no. 5, July 31, 1919, pp. 175-178 and 193. Experience of Quebec Province Highway officials, particularly in regard to maintaining roads subject to heavy automobile traffic. Translation of paper read in French before Can. Good Roads Assn.

Recommended Method of Resurfacing an Old Macadam Road that is Filled with Ruts and Holes, William N. Bosler. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 69-70. Practice in Central Kentucky.

Water-Bound Macadam in Multnomah County, Ore., H. B. Chapman. Am. City, Town & County Ed., vol. 21, no. 2, Aug. 1919, pp. 111-114, 3 figs. Advocates construction of water-bound macadam where travel is not too great.

Maintenance

Maintenance Costs of Primary Highways in Washington for Two-Year Period, George F. Cotterill. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 51-56. State funds from motor-license revenue apportioned to counties for purposes of maintenance and repairing highways. Rules, regulations and requirements are prescribed by State Highway Board.

See also Patrol System.

High Cost of Maintenance of Light Macadam Highways, Frederick Stuart Greene. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 353-355. Commissioner's answer to inquiry resulting from published statement that only concrete pavement would be built hereafter in New York State.

Highway Maintenance in Wisconsin—I, II, III, J. T. Donaghey. Good Roads, vol. 18, nos. 7, 8 and 9, Aug. 13, 20 and 27, 1919, pp. 87-89, 97-98 and 105-106 and p. 108, 2 figs. Aug. 13: Plan adopted by Wisconsin Highway Commission for taking care of highways by patrol system. Duties of patrolmen. Aug. 20: Specifications approved by Highway Commission. Concerning use of graders, drags and dragging. Aug. 27: Use of road planers and graders. Methods for sandy and clayey roads.

Methods of Maintaining Highways Systems Prior to Construction by the State or County, Frederic E. Everett. Am. City, Town & County Ed., vol. 21, no. 2, Aug. 1919, pp. 107-110. Particularly experience of New Hampshire.

Material-Handling Plant

Labor Saving Material Handling Plant for Concrete Road Construction, A. R. Losh. Eng. & Contracting, vol. 52, no. 6, Aug. 1919, pp. 172-173, 2 figs. Materials are received at central storage and loading plant and are sent direct to mixer in batch units by means of industrial railway equipment. From Public Roads.

Patrol System

Lessons from 1918 Experiences of Patrol System of Road Maintenance in Wisconsin. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, pp. 158-159, 1 fig. Data compiled by State Highway Commission. Maintenance in Wisconsin was carried out under a patrol system, supplemented in practically all counties by small gangs, for reconstruction and heavy repair work.

Road Machinery

The Selection and Use of County Road Machinery, J. R. Johnson. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 64-66. Concerning factors influencing selections and precautions to take for maintaining equipment in good conditions.

Economic Utilization of Labor Saving Road Machinery, Chas. M. Upham. Good Roads, vol. 18, no. 6, Aug. 6, 1919, pp. 75-76, 2 figs. Advantages of central loading method of handling material in construction of cement-concrete pavements in Delaware. Paper presented before Am. Road Builders' Assn.

Rural Roads

Proportion and Reasonable Economy in Rural Road Design, W. G. Harger. Eng. News-Rec., vol. 83, no. 7, Aug. 14, 1919, pp. 324-327, 1 fig. Discussion of correct alignment, grades, surfacing and foundations. Comparison of recent practice with that of 10 years ago.

Recommended Practice of Mississippi Valley State Highway Departments for Concrete Road Construction. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, pp. 166-167. From report of conference of Mississippi Valley Assn. of State Highway Dept., held at Chicago to consider questions relating to rural concrete-road construction.

Standard Details

Standard Details of New Jersey State Highway Department Minor Features of State Roads. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, p. 163, 6 figs. Standard concrete gutter, standard method of banking on curves, standard wooden guard rail and standard details for catch basins and culvert pipes.

Monolithic Brick Road

New Mechanical Methods Employed with Marked Success in Building Monolithic Brick Road from Ashtabula to Conneaut, Ohio, F. A. Churchill. Mun. & County Eng., vol. 57, no. 2, August 1919, pp. 57-58, 1 fig. By means of two automatic templets which were used for fashioning concrete foundation of monolithic brick road, constructor is said to have been able to build from 1000 ft. to 1100 ft. of monolithic 16-ft. pavement in a day, including foundation and final grouting.

Standard Sections

Standard Sections of State Highway Department of Pennsylvania for Road Pavements. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, p. 156, 11 figs. For bituminous, concrete telford, macadam, wood-block and stone-block roads; also showing construction of car tracks.

SANITARY ENGINEERING

Cleaning

The Cleaning of Receiving Basins and Grit Chambers by Hydraulic Methods, Charles E. Gregory. Am. City, Town and County Ed., vol. 21, no. 2, Aug. 1919, pp. 151-153. Practice in Borough of Manhattan, N. Y. City.

Grease Interception from Sewage

Grease Interception from House Sewage, H. J. Belmont. Domestic Eng., vol. 88, no. 6, Aug. 9, 1919, pp. 249-251 and 285, 5 figs. Grease traps of various kinds.

Grit Chambers

See also Cleaning.

Incinerators

Incinerators Used at Cantonments. Mun. Jl. & Public Works, vol. 47, no. 8, Aug. 23, 1919, pp. 120-122, 6 figs. Details of design prepared by Construction Division of army for camp of twenty thousand men.

Receiving Tanks

See also Cleaning.

Refuse

Collection and Disposal of Refuse in the Future, F. W. Brookman. Can. Engr., vol. 37, no. 6, Aug. 7, 1919, pp. 207-208. Suggestions in regard to choice of wagons, in view of facilities available in consequence of war. Paper read before Inst. of Cleansing Superintendents, England.

Sewage Tanks

The Cantonment Sewage Tanks. Mun. Jl. & Public Works, vol. 47, no. 4, July 26, 1919, pp. 46-50, 3 figs. Difficulties experienced in operating, reasons therefor in opinion of several experts and means devised for their elimination; sewage of unusual concentration and high grease content.

Sewage Treatment

Electrical Treatment of Sewage: The Landreth Direct Oxidation Process, Henry Germain, Maude Creighton and Benjamin Franklin. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 157-187, 9 figs. Description of million gallon plant erected at Easton, Penna., for demonstration purposes. Account of experimental results.

Results of the Test Run of the Direct Oxidation Experimental Sewage Treatment Plant at Easton, Pa., C. A. Emerson, Jr. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 70-75, 1 fig. Consideration of performance led to conclusion that combined action upon sewage of fine screen, line treatment and electrolytic cell render sewage in such a condition that after sedimentation in properly designed tanks effluent can be discharged into a stream, affording a reasonable dilution of relatively clean water, without danger of creating nuisance.

Sewage-Treatment Works at Langley Field, Virginia, Thorndike Saville and Carl L. Weil. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 374-377, 6 figs. Imhoff tank with receiving bowls, inlet channels, bar screen, distributing channel with downtakes. Dosing chamber, ventilated sprinkling filters, and final settling tanks to be added.

Town Sewerage

Town Sewerage, Edward B. Savage. Surveyor, vol. 56, no. 1435, July 18, 1919, pp. 40-43 and (discussion) pp. 43-44. Concerning provision of manholes and of ventilation and freezing of sewers.

SURVEYING

Twist in Conformed Mapping

On the Twist in Conformed Mapping, T. H. Gronwall. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 248-250. Importance of twist in comparison of maps of different regions.

WATER SUPPLY

Chlorination

See also Water Treatment

Gallery Water-Collecting System

Special Features of the Gallery Water Collecting System of the Des Moines Water Co., Des Moines, Ia., A. F. Luce. Mun. & County Eng., vol. 57, no. 2, Aug. 1919, pp. 75-77, 4 figs. Constructional features of each one of the infiltration galleries, with notes on geology of region.

Metering

Metering and Water Consumption, H. P. T. Matte. Can. Engr., vol. 37, no. 5, July 31, 1919, pp. 181-184. Effective installing of water meters upon consumption of water. Comparison of usage in various cities. Paper read before Western Soc. of Engrs.

Water-Purification Units, Portable

Motor Truck Mounted Water Purification Units, William J. Orchard. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 35-38, 7 figs. Description and operation of unit developed for A. E. F.

Water Treatment

Water Facilities for Southern at Monroe. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 270-272, 4 figs. Treatment given to turbid and muddy water in sedimentation basin and coagulating system.

Feed Water Treating and Purifying Plant, S. H. McKee. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 401-405, 4 figs. Treating capacity is 300,000 gal. per hr. It is noted that plant was laid out so that a 25 per cent extension can be made to give ultimate treating capacity of 375,000 gal. per hr.

Chlorination Treatment of London Water Supply Proves Pronounced Success. Contract Rec., vol. 33, no. 33, Aug. 13, 1919, pp. 779-781. Comments on speed and cost.

Action of Sodium Hyposulphite on Hypochlorites (Action de l'hyposulfite de sodium sur les hypochlorites), F. Dienert and F. Wandenbulcke. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 1, July 7, 1919, pp. 29-30. Experiments to determine quantity of sodium hyposulphite necessary to combine with free chlorine in treatment of water.

Mining Engineering

BASE MATERIALS

Gypsum

Important Developments of Gypsum. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 36-42. Tentative specifications for crude gypsum and calcined gypsum and for gypsum plasters proposed by Am. Soc. for Testing Materials' Committee.

Genesis of the Gypsum Industry. Curtis F. Columbia. Cement, Mill & Quarry, vol. 15, no. 4, Aug. 20, 1919, pp. 27-32, 5 figs. Brief review of the origin, mineralogical properties and geological distribution of gypsum.

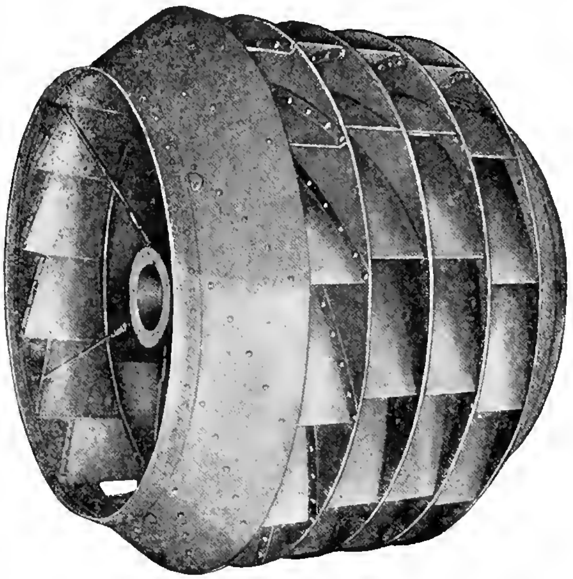
Lime

Chicago Union Lime Works Pit Deepest in Country, William B. Eastwood. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 11-15, 6 figs. Shaft now reaches 320 ft. into dolomite deposit more than 1300 ft. in depth near center of city. Method of quarrying indicated.

Magnesite

Developments in Magnesite Industry, W. C. Phalen. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 27-30. Outline of salient features of domestic industry, as noted by writer on recent trip to various plants in California and Washington.

More Draft for Less Power



GREEN'S
HI-EFFICIENCY HI-SPEED
RADIAL FLOW FANS

require less power and operate at higher speeds, thereby allowing direct connection to smaller motors or turbines than are generally required.

These fans are built in two types—" RB " and " RR "—for forced and induced draft respectively.

The fan housings are exceptionally large and are formed to minimize restrictive losses.

All fans are built with ample ring oiling bearings. With induced draft outfits, water-cooled bearings are used.

The " RR " rotors are so designed that the tips of the blades are radial. With this arrangement all dust and other solid matter are thrown off the blades, due to centrifugal force, and the wheel is always clean and in good running balance, even under the most trying conditions of induced draft, such as are found in cement kiln and steel mill waste heat service.

Our engineers will be glad to submit data covering the requirements of your individual draft problems.

Let us send full details. Write.

THE GREEN FUEL ECONOMIZER Co.
BEACON, N. Y.

Phosphate Rock

Process in Preparation of Phosphate Rock, R. W. St[illegible]. Rock Products, vol 22, no. 16, Aug. 2, 1919, pp. 10-12, 6 figs. Washing, dry [illegible] mining processes.

COAL AND COKE

Allegheny River Mine

A Large Coal Mine on the Allegheny River, Ralph W. Mayer. Coal Age, vol. 16, no. 8, Aug 21, 1919, pp. 316-318, 3 figs. Describing mining operations and various notes of mine. Output 500,000 tons per year.

Carbon Fuel Company

Nine Mines of the Carbon Fuel Company. Black Diamond, vol. 63, no. 6, Aug 9, 1919, pp. 126-138, 34 figs. Methods of mining, preparing and shipping coal. 1918 production of district approached ten million tons.

Classification

Composition and Classification of Domestic Coals, A. C. Fieldner. Gas Age, vol 44, no. 3, Aug. 1, 1919, pp. 104-106, 3 figs. Conclusions drawn from U. S. Bur. of Mines investigation.

Coal Formation

The Formation of Coal, J. D. Kendall. Can. Min. Inst. Bul., no. 88, Aug. 1919, pp. 877-882, 2 figs. Organic remains found in rocks.

Conditions of Formation of Coke (Sur les conditions de formation du coke), Georges Charpy and Gaston Decorps. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 26, June 30, 1919, pp. 1301-1305. Tabulation of experimental results in which effects of preliminary compression and coking temperature were specially studied.

Coke Ovens

New Vertical Coke Ovens—Pintsch Bolz type—at the Gas Works in Düsseldorf (Die neue Vertikalofenanlage "System Pintsch-Bolz" für 100,000 cbm. Tagesleistung mit zugehörigen Koks—und Kohlentransportanlagen auf dem Gaswerk zu Düsseldorf), W. Schweizer. Journal für Gasbeleuchtung u. Wasserversorgung, vol. 59, no. 16, Apr. 15, 1919, pp. 215-221, 11 figs. (To be concluded.)

Coking

The Coking of Illinios Coal in Koppers Type Oven, R. S. McBride and W. A. Selwig. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 122-128, 6 figs. Operating test at plant of Minnesota By-Product Coke Company conducted jointly by Nat. Bur. of Standards and U. S. Bur. of Mines. Test is said to have clearly demonstrated that some of Illinois coals can be coked in "chamber-type" oven without radical change in operating methods for production of coke which can be successfully used in blast furnace.

See also Missouri Camel Coals and Orient Coke.

Carbonizing Illinois Coal, R. S. McBride and W. A. Selvig. Gas Rec., vol. 16, no. 3, Aug. 13, 1919, pp. 11-17, 6 figs. Results of tests made at St. Paul coke oven plant by U. S. Bur. of Mines.

Drills, Electric

Electric Coal Drills, A. H. Telfer. Iron & Coal Trades Rev., vol. 99, no. 2681, July 18, 1919, p. 79, 1 fig. Suggestions in regard to working of thin seams.

Electrical Machinery

Electricity Applied to the Mechanical Mining of Coal, C. S. B. Reed. Assn. Iron & Steel Elec. Engrs., July 1919, pp. 1-13, and (discussion) pp. 13-24. Trend of practice in selecting machine types.

Electrical Operation

St. Vincent Mine of the Mount Pleasant By-product Coal Co., P. B. Rule. Coal Age, vol. 16, no. 7, Aug. 14, 1919, pp. 264-267, 7 figs. Electrically operated mining plant with ultimate capacity of 1,500 tons a day.

Europe

Alarming Shortage of Coal in Europe, George S. Rice. Coal Industry, vol. 2, no. 8, Aug 1919, pp. 311-314. Giving coal situation in allied and neutral countries, Germany and Eastern Europe. Writer believes that countries formerly supplied by England must turn to America.

Extraction

A P[illegible] in Coal Extraction. Coal Age, vol 16, no. 6, Aug. 7, 1919, pp. 234-235, 1 fig. Account of mining conditions and present practice in coal field where present extraction varies from 10 to 50 per cent. Discussion is invited with view to development and adoption of methods that will permit better recovery.

Mining Methods

A Model Illinois Coal Mine, S. Bowles King. Mine & Quarry, vol. 11, no. 3, July 1919, pp. 1172-1185, 24 figs. Mining methods.

A Modern Mine in a Progressive State, Andrews Allen. Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 303-309, 11 figs. Notes on layout and operation of Kathleen mine of Union Colliery Co. located at Dowell, Ill. Holdings consist of approximately 3143 acres of coal. Seam is from 7 to 9 ft. thick at average depth of 200 ft.

Fuel Economy in Power Production, W. T. Lane. Iron & Coal Trades Rev., vol. 99, no. 2683, Aug. 1, 1919, pp. 135-137, 4 figs. How to reduce (1) losses incurred by having to leave large pillars of coal for various purposes, (2) losses due to unsuitable methods in working seams, (3) losses due to non-working of thin seams of coal and (4) losses due to "gobbing" of small coal. Paper read before South Wales Inst. of Engrs.

Winning and Preparation of Coal, John H. Anderson. Trans. Inst. Marine Engrs., vol. 31, no. 243, June 1919, pp. 23-124, 77 figs., partly on 19 supp. sheets. Account of methods followed at various English mines. Incidentally writer suggests greater use of mechanical appliances to make it possible to work seams of coal that otherwise could not be reached.

Missouri Cannel Coals

The Carbonization of Missouri Cannel Coals. Bul. School of Mines & Metallurgy, University of Missouri, Technical Series, vol. 5, no. 1, Aug. 1919, pp. 7-49, 11 figs. Tests in which five different cannel coals were subjected to destructive distillation in gas-fired horizontal retort and compared with bituminous coal coked under similar conditions, are reported to have shown that decomposition temperature of cannel coals is much lower than that of bituminous coal.

Orient Coal

Experimental-Retort Tests of Orient Coal, R. S. McBride and I. V. Brumbaugh. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 171-174, 3 figs. Investigation on influence of coking temperature upon quantity and quality of coke produced. Comparison with results obtained when using other coals.

Roof Actions

Graphic Illustrations of Roof Actions, R. Z. Virgin. Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 320-321, 4 figs. Method for using wire rope to strengthen timbers suggested.

Stripping

Coal Stripping in the United States—VI. Wilbur Greely Burroughs, Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 322-328, 4 figs. Approximate cost and efficiency of operations, care of stripping machinery, and tables of what has been accomplished.

Timbering

See Roof Action.

Washeries

Some Suggestions for the Standardizing of Guarantees for Coal Washeries, Sherwood Hunter. Colliery Guardian, vol. 118, no. 3056, July 25, 1919, p. 229. How to interpret "free coal" and "free dirt" in terms of specific gravity.

Washers

Further Improvements on the "Draper" Washer, J. M. Draper. Proc. of South Wales Inst. of Engrs., vol. 35, no. 1, July 18, 1919, pp. 21-32 and (discussion) pp. 32-39, 8 figs. It is claimed for this type of coal washer that it effects perfect separation without requiring skilled attention by direct upward flow of water at a rate slightly exceeding velocity fall of coal, without pulsators or mechanical motion.

Waste Utilization

Utilization of Coal Waste (L'utilisation des déchets de houille), H. Copaux. Chimie & Industrie, vol. 2, no. 6, June 1919, pp. 656-660. Extraction of by-products. Report of special committee appointed by Société de Chimie Industrielle.

COPPER

Horwood Process

The Horwood Process as Applied to the Copper-Zinc Ore of the Afterthought Mine, A. H. Heller. Min. & Sci. Press, vol. 119, no. 5, Aug. 2, 1919, pp. 151-158, 4 figs. Construction of 300-ton plant at California mine where tests with Horwood process are said to have given very promising results.

Huntingdon Mine

The Huntingdon Copper Mine, Quebec, Reginald E. Hore. Can. Min. Jl., vol. 40, no. 31, Aug. 6, 1919, pp. 582-584, 4 figs. Account of mining operations.

Slag

Method of Handling Granulated Slag in Anaconda, Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 4, July 26, 1919, pp. 118-120, 6 figs. Combination of granulation and haulage methods.

EXPLOSIVES

Detonators

Equipment for Detonation of Explosives by Electricity. Eng. & Contracting, vol. 52, no. 8, Aug. 20, 1919, pp. 220-221, 1 fig. Developed by U. S. Army during the war.

Permissible Explosives

Permissible Explosives, John E. Miller. Coal Age, vol. 16, no. 6, Aug. 7, 1919, pp. 225-227, 18 figs. Safety rules and suggestions prepared by Bur. of Mines.

GEOLOGY AND MINES

Calcite Crystals

Some Notes on Japanese Minerals, Shimmatsu Ichikawa. Am. Jl. of Sci. (Fourth Series), vol. 48, no. 284, Aug. 1919, pp. 124-131, 3 figs. Concerning natural etchings of calcite crystals.

Coral-Reef Zone

The Coral-Reef Zone During and After the Glacial Period, Reginald A. Daly. Am. Jl. of Sci. (Fourth Series), vol. 48, no. 284, Aug. 1919, pp. 136-159. Theory explaining their origin based on geological facts.

Crystallography of Carbonates

Refraction Indices of Rhombohedric Carbonates (Sur les indices de réfraction des carbonates rhomboédriques), Paul Gaubert. Bulletin de la Société Française de Minéralogie, vol. 42, no. 1-3, Jan.-Mar. 1919, pp. 88-120. Measurements on crystals belonging to isomorphous series.

Deep-Level Temperatures

The Maximum Temperature in Large Tunnels and Deep Wells With a Trial Empirical Formula, F. Butavand. Eng. & Contracting, vol. 52, no. 5, July 30, 1919, pp. 119-120. Temperatures obtained by U. S. Geological Survey in wells located about five miles north of Clarksburg, W. Va., found to agree closely with those determined by suggested metrical formula. Translated from Génie Civil.

Dissociation of Carbonate Rocks

An Apparatus for Studying the Dissociation of Carbonate Rocks, G. A. Bole. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 410-417, 2 figs. Victor Meyer vapor density apparatus, in which steam jacket has been replaced by an electrical tube furnace.

Earthquakes

A Seasonal Variation in the Frequency of Earthquakes, Richard Dixon Oldham. Quarterly Jl. of Geological Soc., vol. 74, no. 294, July 9, 1919, pp. 99-104 and (discussion), pp. 104-105, 1 fig. on separate supp. plate. Records of observations of earthquakes occurring at time of great Indian earthquake of 1917.

Fire Clays

Notes on Fire Clays of the Northern Appalachian Coal Basin, Ellis Lovejoy. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 374-385 and (discussion), pp. 385-390, 1 fig. Classification into four chief flint fireclays; occurrence and properties of each.

Japanese Minerals

See Calcite Crystals.

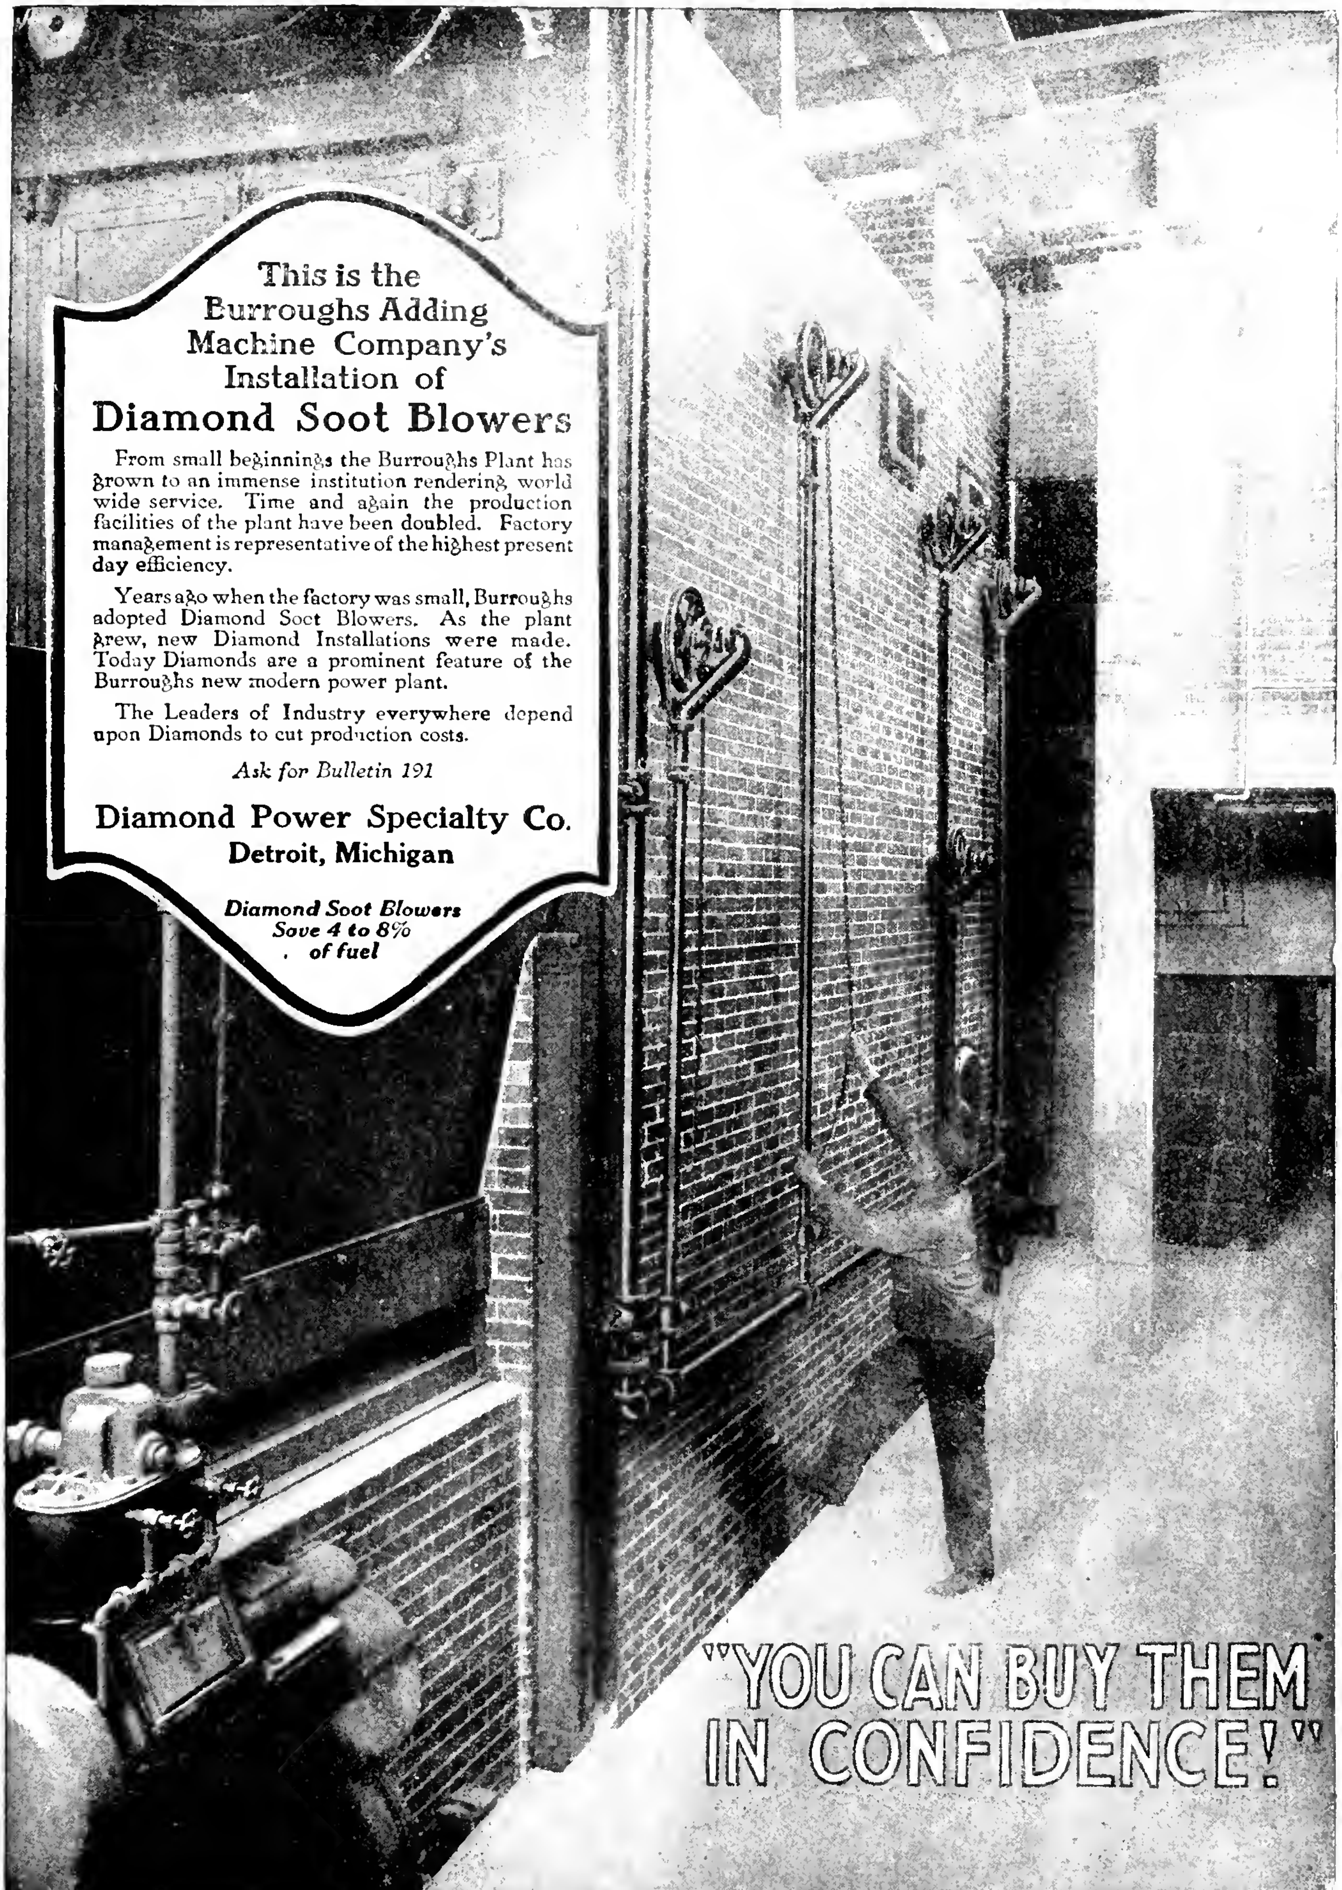
Mississippi

Mississippi—Its Geology, Geography, Soil and Mineral Resources, E. N. Lowe. Miss. State Geological Survey, Bul. no. 14, 1919, 346 pp., 20 figs. Popular presentations of previous published reports of State Geological Survey.

Pre-Cambrian

Relation of Regional Deformations to the Distribution of Ore in the Pre-Cambrian, Ellsworth Y. Dougherty. Min. & Sci. Press, vol. 119, no. 7, Aug. 16, 1919, pp. 227-230, 1 fig. Concerning hypothesis that ore deposits of hydrothermal and igneous types can be referred to igneous activity of well-marked epochs.

Some Stratigraphic and Structural Features of the Pre-Cambrian of Northern Quebec—IV, H. C. Cooke. Jl. Geology, vol. 27, no. 5, July-Aug. 1919, pp. 367-382, 1 fig. Explorations of northern Quebec show existence of fairly sharp boundary line on one side of which limestone is member of Grenville while on the other it does not appear. From theoretical conditions writer concludes that this line represents an ancient topographic break, either a shore line or a boundary of a submerged plateau.



This is the
Burroughs Adding
Machine Company's
Installation of
Diamond Soot Blowers
From small beginnings the Burroughs Plant has grown to an immense institution rendering world wide service. Time and again the production facilities of the plant have been doubled. Factory management is representative of the highest present day efficiency.
Years ago when the factory was small, Burroughs adopted Diamond Soot Blowers. As the plant grew, new Diamond Installations were made. Today Diamonds are a prominent feature of the Burroughs new modern power plant.
The Leaders of Industry everywhere depend upon Diamonds to cut production costs.
Ask for Bulletin 191
Diamond Power Specialty Co.
Detroit, Michigan
Diamond Soot Blowers
Save 4 to 8%
of fuel
"YOU CAN BUY THEM
IN CONFIDENCE!"

Sedimentation

Inequalities of Sedimentation. E. M. Kindle. Jl. Geology, vol. 27, no. 5, July-Aug. 1919, pp. 339-366. Points out various factors which make for periodic variability in rates of deposition and cites examples on existing lakes and seas to illustrate sharp contrasts in rate at which sediments accumulate at different points near the same coast line.

IRON

Canada

The Production of Coal and Iron Ore in Canada Considered in Relation to the Iron and Steel Industries. F. W. Gray. Iron & Steel of Can., vol. 2, no. 8, Aug. 1919, pp. 177-179, 2 figs. Based on statistics compiled by Dept. of Mines.

LEAD, ZINC, TIN

Lead Mines, Wanlockhead

The Wanlockhead Lead Mines. John Mitchell. Min. Mag., vol. 21, no. 1, July 1919, pp. 11-20, 3 figs. General description of South of Scotland mining district and account of records of working Leadhills and Wanlockedhead mines.

Zinc in Belgium

Zinc Industry in Belgium, March F. Chase. Dept. of Interior, Bur. Mines, Minerals Investigations Series, no. 18, May 1919, 8 pp. Economical position of industry before the war and statistics of production from 1913 to 1918.

MINES AND MINING

Air in Mines

Notes on Defective Air in Disused Raises and Backstopes. C. J. Gray. Jl. of Chem., Metallurgical & Min. Soc. of South Africa, vol 19, no. 11, May 1919, pp. 240-243 and (discussion), pp. 243-246. Result of analysis with Haldane's tube of air at various points in a disused raise in one of Witwatersrand mines.

See also Carbon Dioxide.

Apex Law

An Unusual Apex Case. R. T. Walker. Min. & Sci. Press, vol. 119, no. 8, Aug. 23, 1919, pp. 262-264, 1 fig. How litigation between two companies led to disclosure of unusual type of vein structure.

Canada, Western

The Resources of Western Canada. R. C. Wallis. Jl. Eng. Inst. Can., vol. 2, no. 8, Aug. 1919, pp. 551-554. Geological and topographical notes, together with historical account of development of mining industry.

Carbon Dioxide

A "Safety First" Method for the Estimation of CO_2 in Mine Air. H. R. S. Wilkes. Jl. of Chem., Metallurgical & Min. Soc. of South Africa, vol. 19, no. 11, May 1919, pp. 246-249. Based on standard method except that quantities used are tenths and operation of titration with oxalic acid is eliminated.

Cement Gun

Results Obtained from the Use of the Cement Gun at the Cadogan Mine. Fred Norman. Coal Age, vol. 16, no. 7, Aug. 14, 1919, pp. 269-270, 4 figs. States difficulties in operation due to bad, friable top rock, and notes how such difficulties were overcome by use of cement gun.

Dredges

A Platinum Dredger. Engineer, vol. 128, no. 3317, July 25, 1919, pp. 90-91, 4 figs. Consists of large steel-framed and plated pontoon with unusual weight for bucket ladder.

Drills

Pneumatic Electric Rock Drill and Some of the Tools Used in Its Construction. H. Frank A. Stanley. Am. Mach., vol. 51, no. 6, Aug. 7, 1919, pp. 263-266, 7 figs. Jigs and fixtures provided for operations involved in finishing of parts.

Modern Rock Drill Practice. David Penman. Min. Mag., vol. 21, no. 1, July 1919, pp. 21-28, 13 figs. Particulars of Holman piston drill, Climax Imperial hammer drill and Ingersoll Rand hammer drill. (To be continued.)

Gas Detectors

Gas Detectors for Miners' Electric Lamps. T. J. Thomas. Colliery Guardian, vol. 118, no. 3058, Aug. 8, 1919, pp. 361-362. Possibilities of research. (Concluded.)

See also Carbon Dioxide.

Laws, Mining

Common Violations of the Mining Laws. W. J. Heatherman. Coal Industry, vol. 2, no. 8, Aug. 1919, pp. 315-316. Failure to set proper timbers, shooting off solid, riding on trips, lack of adequate means of egress and ingress, recklessness and ignorance considered chief obstacles to mining safety. Paper presented before W. Va. Coal Min. Inst.

See also Apex Law.

Maps, Mine

Conventional Symbols for Mine Maps. Lester C. Uren. Min. & Sci. Press, vol. 119, no. 7, Aug. 16, 1919, pp. 231-234, 4 figs. Used by engineering students in mine mapping at Univ. of Cal.

Quarries, Ironstone

Stripping and Working Ironstone Quarries. F. H. Hatch. Quarry, vol. 24, no. 270, Aug. 1919, pp. 211-216, 5 figs. Practice in English mines. Lecture delivered at Royal School of Mines.

Roasting

Experiments in Magnetizing Roasting. George J. Young. Eng. & Min. Jl., vol. 108, no. 5, Aug. 2, 1919, pp. 176-177, 2 figs. Experimental results of tests made with pyritic concentrate.

Safety

Importance of Safety in Mining and Metallurgical Industries. W. R. Plank. Coal Age, vol. 16, no. 6, Aug. 7, 1919, pp. 228-231, 5 figs. Proposes establishment of safety departments, greater coöperation between employer and employee and continued training in first-aid and mine rescue work, as means of curtailing accidents.

Signaling Systems

Mine Electric Signaling Practice. Terrell Croft. Coal Age, vol. 16, no. 8, Aug. 21, 1919, pp. 308-312, 11 figs. Particulars of various signaling systems.

Skip-Change

Skip-Changing Device at the Steward Mine. Oliver E. Jager. Min. & Sci. Press, vol. 119, no. 6, Aug. 9, 1919, pp. 187-190, 5 figs. Device is of hinged guide and crawl type.

U. S. Production, 1916

Mineral Production of the United States in 1916. H. D. McCaskey and Martha B. Clark. Dept. of Interior, U. S. Geological Survey, Series 13A, June 28, 1919, 70 pp., 1 fig. Statistics including comparison with earlier years.

MINOR INDUSTRIAL MATERIALS

Tungsten

Tungsten and Its Importance in Industry (Wolframmetall und seine Bedeutung für die Industrie). Hugo Lohmann. Elektrotechnische Zeitschrift, vol. 25, no. 11-12, Feb.-Mar. 1919, pp. 141-143. As a substitute for diamonds in tool manufacture, for the chemical industry (crucibles, tubes), for the manufacture of electric bulbs, etc.

Tungsten and the Utilization of Slag in the Mining Industry (Wolframgewinnung und Schlackenverwertung im Bergwerksbetriebe). Zeitschrift f. die gesamte Giessereipraxis, vol. 40, no. 6, Feb. 8, 1919, pp. 65-66. Tungstic acid recovered from some tin slag amounted to from 10 to 15 per cent.

OIL AND GAS

England

Oil in England. J. Ford. Iron & Coal Trades Rev., vol. 99, no. 2682, July 25, 1919, pp. 110-111, 3 figs. Account of Derbyshire investigations which led to finding free oil.

Gas, Natural

Transportation and Distribution of Natural Gas. H. A. Quay. Gas Age, vol. 44, no. 3, Aug. 1, 1919, pp. 102-103. Improvements obtained by installation of meters.

Metering

See Gas, Natural.

Mississippi

Oil and Gas Prospecting in Mississippi. E. N. Lowe. Miss. State Geological Survey, Bul. no. 15, 1919, 78 pp., 2 figs. Condensation of reports of actual investigations and of data presented in publications of various scientific organizations.

Prospecting

See Mississippi.

Sealing

Sealing Formations by Slime-Laden Fluid. Seth S. Langley. Eng. & Min. Jl., vol. 108, no. 7, Aug. 16, 1919, pp. 268-271, 4 figs. Methods for controlling gas pressure, preventing migration of oil, gas, and water, and preparing wells for abandonment.

Shales

Oil Shales. Louis Simpson. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 176-178. Suggestions in regard to selecting method of retort.

Well Drilling

The Rotary Method of Well Drilling. Albert G. Wolf. Eng. & Min. Jl., vol. 108, no. 5, Aug. 2, 1919, pp. 171-175, 5 figs. Process of sinking oil and gas wells in unconsolidated strata by means of bits used in alternating hard and soft formations.

PRECIOUS MINERALS

Aspen

See Silver Ore.

Ontario

West Shining Tree Gold District, Ontario. L. H. Goodwin. Eng. & Min. Jl., vol. 108, no. 7, Aug. 16, 1919, pp. 261-264, 4 figs. Notable feature of prospects in area is said to be presence of spectacularly rich specimen ore carrying heavy gold.

Silver Ore

Deep-Level Development in Aspen. Frederick W. Foote. Eng. & Min. Jl., vol. 108, no. 5, Aug. 2, 1919, pp. 178-180, 4 figs. Concentration by jigs and tables. Camp contains silver-ore deposits in sedimentary rocks.

Metallurgy

BLAST FURNACES

British Blast-Furnace Plant

The Glengarnock Works of David Colville and Sons, Limited. Engineer, vol. 128, no. 3317, July 25, 1919, pp. 75-78, 19 figs. partly on four supp. plates. Arrangement and details of blast-furnace, bessemer, open-hearth, structural and by-product departments.

Charger, Blast-Furnace

A German Blast-Furnace Charger. Iron & Coal Trades Rev., vol. 99, no. 2680, July 11, 1919, pp. 40-41, 5 figs. Automatic skip for charging furnace in lieu of hand labor. Output capacity of new furnace is 400 tons in 24 hours, involving handling of about 1200 tons of ore and about 500 to 600 tons of coke. From Stahl und Eisen.

COPPER AND NICKEL

Speiss Smelting

Melting Copper Speiss in Electric Furnace (Fusion de speiss de cuivre au four électrique). P. Papencordt. Journal du Four Electrique, vol. 28, no. 14, July 15, 1919, pp. 98-100. Experiments to determine economy of recuperating metals contained in speiss.

FERROUS ALLOYS

Electrical Production of Ferroalloys

Electrical Production of Ferroalloys (La producción eléctrica de aleaciones férreas). José María Navarrete. Energía Eléctrica, vol. 21, no. 12, June 25, 1919, pp. 137-140. Concerning types and sizes of furnaces used in United States, France, England, and Switzerland.

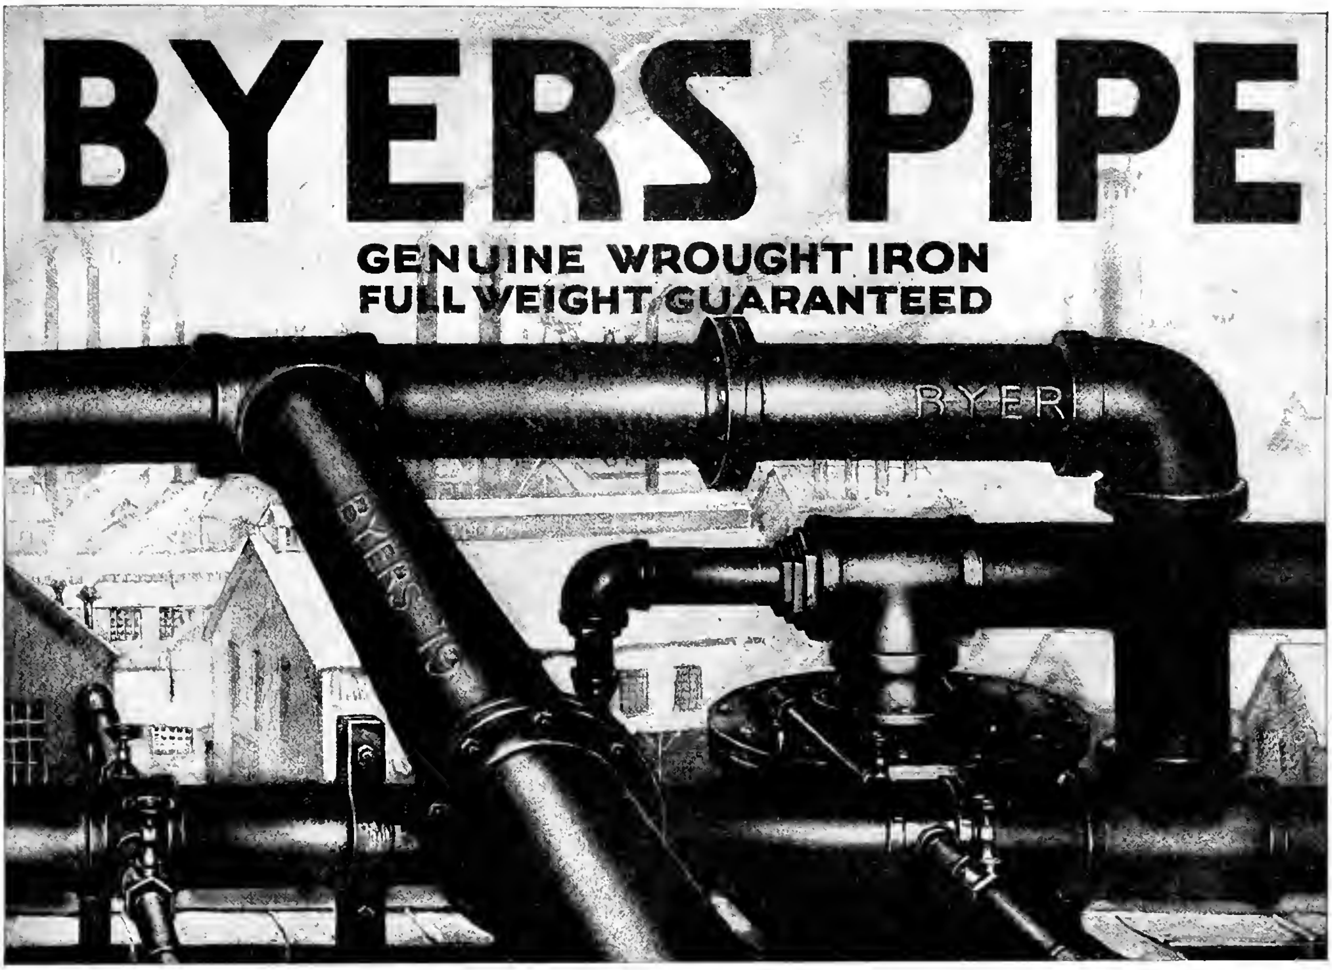
Nickel-Chromium Steels

Nickel-Chromium Steels. J. H. S. Dickenson. Jl. West of Scotland Iron & Steel Inst., vol. 26, no. 8, April 1919, pp. 110-123 and (discussion) pp. 123-125, 15 figs. on 8 supplement plates. Account of their commercial development and of results obtained in tests of various samples which were all oil hardened and tempered alike and afterward cooled off at different rates. Tensile and notched-bar test results are given in tabulated form.

FLOTATION

Spain

Status of Flotation in Spain. Eng. & Min. Jl., vol. 108, no. 8, Aug. 23, 1919, pp. 316-317. Possibility of utilizing process for recovering mineral content of dumps dating back to early Rome.



The Life of Pipe

To a child's mind, the most fragile penny toy conveys no impression of weakness—until after it is broken.

To the young or inexperienced, the question of durability of materials usually is viewed with optimism.

To the old or experienced, promises for the future, if not based on past performance, are of questionable value. Scepticism grows with experience.

That is why Byers pipe is so largely in evidence in the construction and operation of large and important enterprises, entrusted to the care of experienced men who have wisely blended technical knowledge with practical observation.

FURNACES

Electric Furnaces

Electric Furnaces for Melting Non-Ferrous Metal. The Baily Furnace. Metal Trades, vol. 10, no. 8, Aug. 1919, pp. 366-370, 6 figs. Of resistance type, its heating element consisting essentially of granular carbon placed in silicon carbide trough.

Electric Smelting

Electric Smelting with Special Reference to Canadian Conditions, Robert M. Keeney. Can. Min. Inst. Bul. no. 88, Aug. 1919, pp. 846-853. Also Colo. School of Mines Mag., vol. 9, no. 8, Aug. 1919, pp. 219-222. Electric furnace is seen not as competitor of combustion furnace, but as means of treating certain ores and of working out certain processes in a more advantageous manner than it is possible to do in a combustion furnace, or treat ores that exist in certain districts in Canada where, owing to local conditions of cheap power and expensive coal and coke, combustion furnaces are not practicable.

Slags

Losses in Furnace Slags, Edward H. Robie. Eng. & Min. Jl., vol. 108, no. 7, Aug. 16, 1919, pp. 265-267, 2 figs. Results of tests at smeltery of International Nickel Co., Copper Cliff, Ont., to determine influence of slag and matte composition and temperature on copper content of slags.

IRON AND STEEL

Cobaltcrom Steel

Making Cobaltcrom Steel Tools. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1173-1174, 2 figs. Interesting feature of this steel is said to be that dies, milling cutters, etc., made from it can be cast to shape, teeth in cutters, for example, being cast directly in blank and requiring no other machining than grinding and boring or sometimes only reaming of hole.

Fibrous Structure in Steel

Fibrous Structure in High Carbon Steel, A. W. Lorenz. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 203-204. Facts and data in connection with a certain ordnance contract.

Flakes in Steel

Flakes in Alloy Steel, Ernest Edgar Thum. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 145-146. Recapitulation and discussion of various articles on flakes in gun tubes and other large forgings of alloy steels.

France

Metallurgy of Iron (La métallurgie du fer). Métallurgie, vol. 39, 31 and 33, July 23, July 30 and Aug. 13, 1919, pp. 1935-1936, pp. 2010-2011, and pp. 2162-2164. From general report on conditions in French industry published by Ministry of Commerce.

Magnet Steel

Steel for Magnets—V. Mech. World, vol. 66, no. 1700, Aug. 1, 1919, pp. 57-58, 4 figs. Essential physical changes taking place during hardening process in case of magnet steels. (Continuation of serial.)

Malleable Iron

The Manufacture of Malleable Iron, Henry A. Johnson. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1163-1164. With reference to physical and chemical phenomena that take place during process and mention of ordinary limits for chemical analysis for white-iron castings.

Metallurgical Calculations

Modern Steel Metallurgical Calculations, Charles H. F. Bagley. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 373-377. Synthetic method of calculating consumption of materials and technical results of manufacture of steel. Different kinds of pig iron and various standard processes are considered. Paper read before British Iron & Steel Inst.

Open-Hearth Processes

The Yields and Waste in Open Hearth Processes, J. E. Fletcher. Managing Engr., vol. 6, no. 3, July 1919, pp. 59-64, 5 figs. Photomicrographs illustrating progressive refining of white (eutectic) iron containing about 4 per cent carbon. Paper read before Stoke-on-Trent Engrs.' & Eng. Students' Assn. (To be continued.)

Soaking Pits, Electrically Heated

Electrically Heated Soaking Pits, Re-Heating and Annealing Furnaces, and Automatic Furnaces, for Heat Treatment, as Applied to the Steel Industry, Thaddeus F. Baily. Iron & Steel of Can., vol. 2, no. 8, Aug. 1919, pp. 180-186, 5 figs. Paper read before Iron & Steel Inst. of America.

Tool Steel

Modern High Speed Tool Steel, John A. Mathews. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 489-492. Origin and development of modern high-speed steel; hardening and tempering qualities. Paper read before Am. Soc. for Testing Materials.

MICROPHOTOGRAPHY

Etching

See Polishing and Etching.

Polishing and Etching

Notes on Practical Metallographic Methods, Austin B. Wilson. Blast Furnace & Steel Plant, vol. 7, no. 8, Aug. 1919, pp. 380-386, 15 figs. Methods of polishing and etching for advanced research work.

Radiometallography

Radiometallography. Engineer, vol. 128, no. 3317, July 25, 1919, pp. 80-81, 8 figs. Arrangement of Coolidge tube for radiographic examination. Reproduction of various radiographs of castings.

The Examination of Materials by X-Rays. Engineering, vol. 108, no. 2794, July 18, 1919, p. 76, 4 figs. Radiographs of aluminum castings.

NON-FERROUS ALLOYS

Aluminum Bronzes

Relation of Microstructure to Phase Changes in Heat-Treated Aluminum Bronzes, L. R. Seidell and G. J. Horvitz. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 179-181, 13 figs. Tests of bronze of composition 90 per cent copper and 10 per cent aluminum, and conclusions in regard to adptability of this bronze for bearing and corrosion-resistant metal.

Brass Melting

Melting of Some Non-Ferrous Metals and Their Alloys in the Electric Furnace, E. F. Collins. Jl. Cleveland Eng. Soc., vol. 11, no. 5 & 6, Mar.-July 1919, pp. 293-314 and (discussion) pp. 314-320, 19 figs. Requirements for economical brass-melting furnaces, and comparison of electric melting with fuel-fired furnaces.

Monel Metal

Monel Metal, Hugh R. Williams. Sci. Am. Supp., vol. 88, no. 2276, Aug. 16, 1919, pp. 98-99, 3 figs. Claimed points of superiority of this new natural alloy in all fields for noncorroding steel.

OCCLUDED GASES

Preventing Occlusion of Gases, Robert Hadfield. Iron Trade Rev., vol. 65, no. 8, Aug. 21, 1919, pp. 504-505. Silicon found by Terre Noire Co., France, to assist materially in reduction of unsoundness and blowholes and to tend to rid steel of absorbed gases. From paper presented before Faraday Soc., Lond.

VARIA

Silicon-Manganese

Silicon-Manganese from Electric Furnaces, B. G. Klugh. Iron Age, vol. 104, no. 7, Aug. 14, 1919, pp. 438-440. Manufacturing data for various compositions. Manganiferous slags as raw material. Uses for the alloy. Paper read before Am. Electrochemical Soc.

Aeronautics

AIRCRAFT

B-Class Airships

See United States.

British Airships

The British Navy Airship S. R. 1, Italian "M" Type. Flight, vol. 11, no. 30, July 24, 1919, pp. 979-981, 10 figs. Semi-rigid type. Dimensions are: Length, 290 ft.; diameter, 58 ft.; overall height, 72 ft.; disposable lift, 7700 lb.

See also R-34.

Lighter-Than-Air Craft, T. R. Cave-Browne-Cave. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 167-175, 3 figs. Structural characteristics of British naval types. Paper read before Roy. Aeronautical Soc. of Gt. Britain.

C-Class Dirigible

See United States.

R-34

H. M. Dirigible R-34, A. E. Bishop. Rudder, vol. 35, no. 8, Aug. 1919, pp. 353-357, 5 figs. With notes on development of airships.

Rigid Airships

General Fundamentals of Rigid Airship Design, R. H. Upson. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 117-119, 1 fig. From study of British and German types.

Stresses in a Rigid Airship Due to Bending, E. H. Lewitt. Aeronautics, vol. 17, no. 299, July 10, 1919, pp. 48-50, 5 figs. Technical study leads to assertion that ordinary bending formula $M/I = f/y$ may be applied to rigid airship with diagonal bracings of wire, providing that section of ship can be inscribed in circle and that transverse girders are of equal length, the longitudinals being assumed to take all the bending.

Rigid Airships (Les dirigeables rigides), E. Gonault. Génie Civil, vol. 75, no. 4, July 25, 1919, pp. 69-78, 18 figs. Constructional details of R-34 and other dirigibles.

United States

Airship Engineering Progress in the United States, J. G. Hunsaker. Aviation, vol. 7, no. 2, Aug. 15, 1919, pp. 72-76, 7 figs. Development of B class. (To be concluded.)

U. S. Navy Class "C" Dirigible. Aerial Age, vol. 9, no. 24, Aug. 25, 1919, pp. 1095-1098, 6 figs. General specifications. "C" type is 192 ft. long, 43 ft. wide, and 46 ft. high; it has capacity of 180,000 cu. ft.

APPLICATIONS

India

Aviation as Affecting India, Lord Montagu of Beaulieu. Jl. Roy. Soc. Arts, vol. 67, no. 3477, July 11, 1919, pp. 543-551 and (discussion) pp. 551-554, 2 figs. Suggested routes from England to India.

War Period

Progress of Aviation in the War Period, Leonard Bairstow. Engineer, vol. 128, nos. 3317 and 3318, July 25 and Aug. 1, 1919, pp. 93-94 and 115-117, 8 figs. July 25: Reference is made to B. E. 2C. In discussing developments during war, writer considers unfortunate that growth has not been accompanied with usual concurrent growth of civil demand. Graph is given illustrating aerodynamic disadvantages of high speed. Aug. 1: Accelerometer records of loads and records of pitching oscillations. Paper read before Roy. Aeronautical Soc., Great Britain.

AUXILIARY SERVICE

Hangars

Reinforced Concrete Hangars for the Naval Aviation Center of Algiers, E. Carret. Eng. & Contracting, vol. 52, no. 5, July 30, 1919, pp. 132-133, 2 figs. Translated from Génie Civil.

Parachutes

The Smith Parachute. Aerial Age, vol. 9, no. 21, Aug. 4, 1919, p. 974, 4 figs. Of flat type, 28 ft. in diameter, with 42-in. patent shock-absorbing vent supported by 40 silk shroud lines of 250 lb. breaking strength.

Photography

Photographic Industry and National Defense (L'industrie photographique française et la défense nationale), L. P. Clerc. Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 3, May-June 1919, pp. 614-627, 9 figs. Military and civil uses of aerial photography in France.

Respiratory Apparatus

Automatic Respiratory Apparatus for High-Altitude Flights (L'Appareil respiratoire automatique pour vols à haute altitude), M. Garsaux. Aérophile, vol. 27, nos. 11-12, June 1-15, 1919, pp. 176-179, 6 figs. Showing scheme of installation and manner in which it operates.

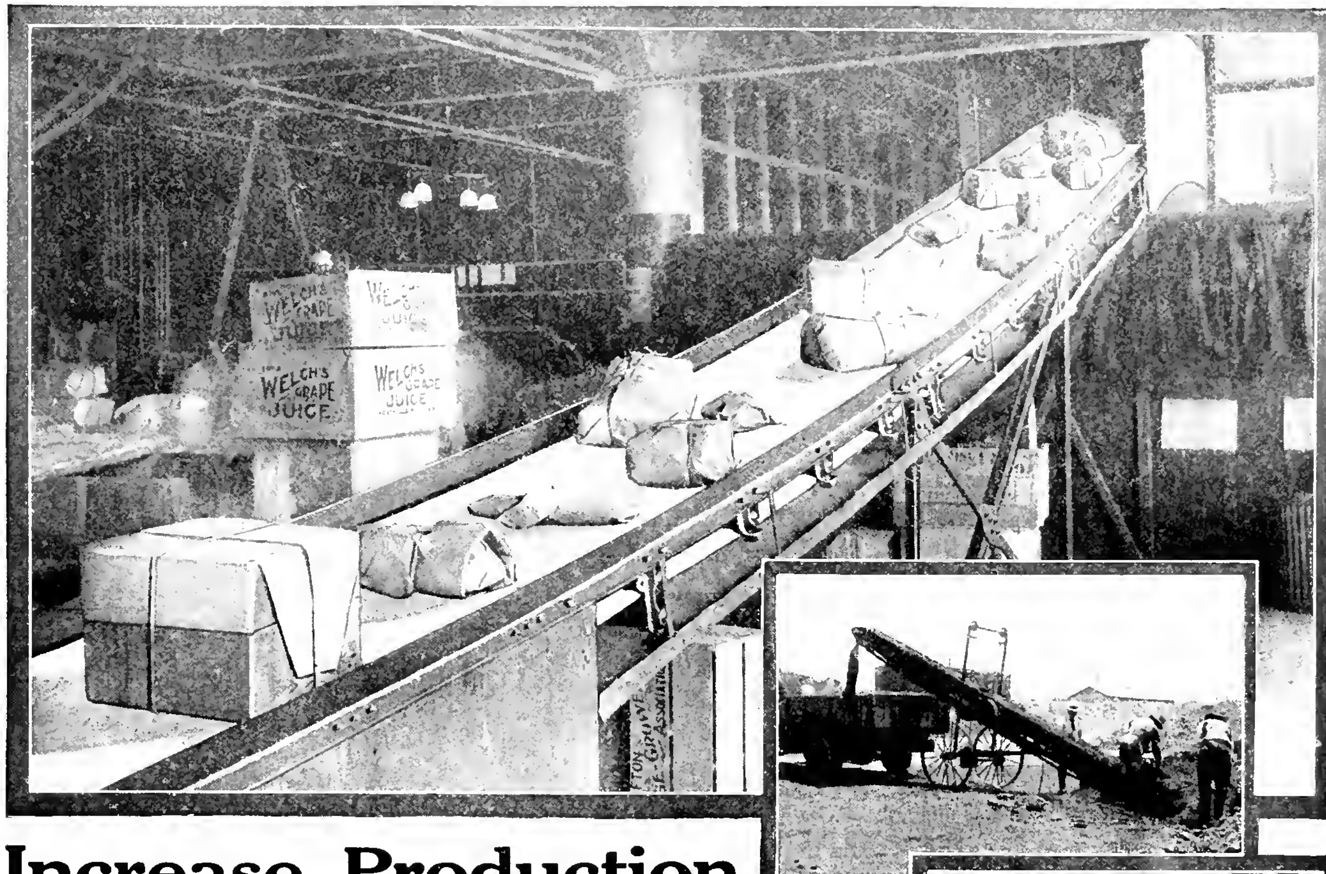
Tanks, Gasoline

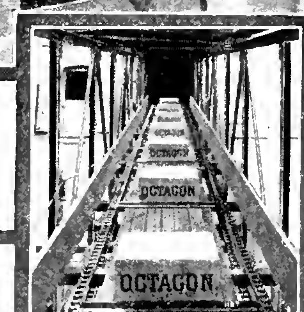
The Imber Self-Sealing Gasoline Tank, George F. McLaughlin. Aerial Age, vol. 9, no. 22, Aug. 11, 1919, no. 1009-1011, 7 figs. Resilient outer rubber covering protects tank so that when inside pressure exceeds a certain point, tank yields and rubber stretches out from side under pressure. This covering also permits self-sealing of tank when struck by bullet.

DESIGN

Horsepower of Resistance

The Horsepower of Resistance in Aeroplane Design, N. I. Lieberman. Mech. Eng., vol. 41,





Increase Production at Lower Costs

YOU can do it, just as hundreds of other concerns are doing it, by installing Link-Belt Labor-Saving Machinery.

Release your hand-labor for more profitable work. Labor is scarce—therefore make use of YOUR labor wisely.

One of our standard elevators or conveyors may be just the thing you need to help speed up your work. Link-Belt Conveyors require little attention and their operation is practically automatic.

Get in touch with our nearest local office and put your problem up to our experienced engineers. No matter what kind of material you ask us to elevate, convey or handle, Link-Belt Machinery can be adapted to it. Catalog and literature on request.

no. 9, Sept. 1919, pp. 721-727 and p. 792, 11 figs. Summary of experimental results obtained by Langley, Lanchester, Foppl, Prandtl, Reynolds and Zahm in regard to resistance coefficients for various types of fuselages, total panel area required and distribution of horsepower consumption. Article concludes with a theoretical study on the probable size of craft, fuel load and power equipment necessary to accomplish a transatlantic flight.

Ceilings

Approximate Ceilings of Aeroplanes. Automobile Engr., vol. 9, no. 129, Aug. 1919, p. 259, 2 figs. Charts given as fairly representative of what may be expected from aeroplanes as at present constructed.

Loads and Stresses

The Loads and Stresses on Aeroplanes, John Case. Aeronautics, vol. 17, no. 300, July 17, 1919, pp. 72-74, 4 figs. Lateral distribution of pressure. Distribution of load between front and rear trusses. (Continuation of serial.)

Metal Construction

Metal Construction of Aircraft, A. P. Thurston. Engineering, vol. 108, nos. 2796 and 2797, Aug. 1 and 8, 1919, pp. 142-144 and 176-180, 34 figs. Aug. 1: Notes on comparative advantages of wood and metal. Aug. 8: Details of metal parts.

Performance

Analysis of Aeroplane Performance in Relation to Height, S. C. S. Part. Aeronautics, vol. 17, no. 300, July 17, 1919, pp. 75-77, 3 figs. How various alterations may be compared when fullest particulars required for Soreau type of curve are not available.

Radiators, Nose Resistance

Resistance Due to Nose Radiator. Aerial Age, vol. 9, no. 21, Aug. 4, 1919, pp. 972-973, 6 figs. Results of wind tunnel experiments. It is concluded that resistance of fuselage with streamline nose is increased more by removing streamline nose and substituting a radiator than it is by adding equivalent free-air radiator and retaining streamline nose.

Resistance of Nose Radiators. Aviation, vol. 7, no. 1, Aug. 1, 1919, pp. 28-29, 6 figs. Report of Nat. Advisory Committee for Aeronautics.

Struts

The Design of Hollow Interplane Struts, Armin Elmendorf. Aviation, vol. 7, no. 2, Aug. 15, 1919, pp. 85-86, 2 figs. Effect of modulus of elasticity on strength, position of material to obtain maximum strength, shear stresses and buckling of hollowed struts considered.

Tail Skids

Theory of Sprung Tail Skids on Aeroplanes. Aerial Age, vol. 9, no. 24, Aug. 25, 1919, pp. 1098. Expression for reaction between skid and ground deduced from equation of motion about axle. From Oesterreichische Flug-Zeitschrift, Dec. 1918.

War Developments

Some Developments in Aircraft Design and Application During the War, Lord Weir. Engineering, vol. 108, no. 2794, July 18, 1919, pp. 93-99, 31 figs. Also Flight, vol. 11, no. 30, July 24, 1919, pp. 987-991, 16 figs. General development in wing construction; progress of design and construction of propellers.

Wing Design

Elements of a General Theory of Airplane-Wing Design, Walter C. Durfee. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 728-729, and (discussion) pp. 729-730 and p. 787, 3 figs. Following subjects considered: Vortex theory of lift; theory of initial motion around wings; vortex theory of shape; hydrodynamic-electromagnetic analogy; action of vortices with reference to each other; action on vortices with reference to their images; influence of local wind; laws of energy content in trailing vortex; friction and head resistance; and explosion of eddies.

ENGINES

B.H.P.

The "B. H. P." Aeroplane Engine. Engineering, vol. 108, no. 2796, Aug. 1, 1919, pp. 135-137, 5 figs. Six-cylinder, double-ignition water-cooled type; output at normal speed of 1400 r.p.m., 240 b.hp.

Carburation, High Altitude

Carburation at High Altitudes (La Carburation aux hautes altitudes), Aérophile, vol. 27, nos. 11-12, June 1-15, 1919, pp. 185-186, 3 figs. Keeping mixture constant by means of turbo-compressors. Scheme of operation.

Maintaining Constant Pressure Before the Carburettors of Aero Engines Regardless of the Altitude, Leslie V. Spencer. Flight, vol. 11, no. 33, Aug. 14, 1919, pp. 1086-1090, 5 figs. Survey of experimental research with notes on supercharger developed by E. H. Sherbondy for Aircraft Production Bureau. (To be concluded.)

Fuels

An Investigation of Airplane Fuels, E. W. Dean and Clarence Netzen. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 126-130. Conducted by Bur. of Mines to ascertain whether or not selection of proper grade of fuel would materially help training fields in getting maximum service from a limited number of planes.

Hispano-Suiza

The Hispano-Suiza Airplane Engine—III, IV, H. O. C. Isenberg. Am. Mach., vol. 51, nos. 6 and 8, Aug. 7 and 21, 1919, pp. 259-261 and 365-368, 23 figs. Aug. 7: System of mounting cylinder blocks. Aug. 21: Preparation and making of complete molds.

Liners, Steel

Aircraft Engine with Steel Liners in Aluminum Cylinder Blocks. Automotive Industries, vol. 41, no. 8, Aug. 21, 1919, pp. 367-369, 8 figs., partly on supp. plate. Puma six-cylinder vertical type with output of 260 hp. at 1500 r.p.m.

Napier Lion Engine

The Napier Lion Aircraft Engine. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 250-258, 29 figs. Said to be lighter per horsepower than any other water-cooled aero engine yet produced. (Weight per b.hp., less fuel and oil, 2.51 lb.) Engine holds altitude record of 30,500 ft.

Rotary Engines

See Zeitlin Aero Engine.

Shock Recorders

Development of an Airplane Shock Recorder, A. F. Zahm. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 237-244, 4 figs. Apparatus consists of many vertical styluses supported individually by springs and recording on a single chronograph drum.

War Developments

Some Developments in Aircraft Design during the War, Lord Weir. Automobile Engr., vol. 9, no. 129, Aug. 1919, pp. 263-266, 10 figs. Also Engineering, vol. 108, no. 2795, July 25, 1919, pp. 108-111, 19 figs. Emphasizes particularly the fact that experience and research work had culminated in production at time of the armistice of various types of machines which represented distinct advance on anything previously used. From paper presented before Northeast Coast Instn. of Engrs. and Shipbuilders.

Zeitlin Aero Engine

The Zeitlin Aero Engine. Aerial Age, vol. 9, no. 22, Aug. 11, 1919, pp. 1012-1014 and 1027, 10 figs. Four-stroke cycle, 9 cyl. rotary type. Fundamental difference with other similar engines is said to be that piston stroke is not of uniform length in each of four movements constituting complete cycle.

MATERIALS OF CONSTRUCTION

Duralumin

See Steel and Duralumin.

Pitch Pockets

Pitch Pockets and Their Relation to the Inspection of Airplane Parts, J. R. Watkins. Jl. Franklin Inst., vol. 188, no. 2, Aug. 1919, pp. 245-253, 3 figs. Résumé of theories advanced to account for presence of pitch pockets and results of tests made at Forest Products Laboratory.

Sheets, Metal, Thin

Metal Construction of Aircraft, A. P. Thurston. Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 224-226, 5 figs. Influence of cold work on physical properties of thin sheets. (Concluded.) Paper read before Royal Aeronautical Soc.

Steel and Duralumin, Comparison of

Metal Construction of Aircraft, A. P. Thurston. Aviation, vol. 7, no. 1, Aug. 1919, pp. 18-21, 2 figs. Comparative values of steel and duralumin. From paper read before Roy. Aeronautical Soc.

METEOROLOGY

Algue Barocyclonometer

See Barocyclonometer.

Aneroids

Aneroids (Ueber Aneroide), E. Warburg and W. Heuse. Zeitschrift f. Instrumentenkunde, vol. 39, no. 2, Feb. 1919, pp. 41-55, 2 figs. Experimental work for reducing influence on the instrument of temperature and of after-effects of former pressures which are more pronounced the greater the difference between the previous pressures and those to be measured is.

Atmospheric Pressure Waves

On the Explosion at Okhta, B. Galitzin. Proc. Roy. Soc., vol. 95, no. A-673, July 15, 1919, pp. 508-515, 3 figs. Records of atmospheric-pressure wave obtained at various observatories in neighborhood used to compute characteristics of motion of wave.

Barocyclonometer

The Algué Barocyclonometer, Robert G. Skerrett. Rudder, vol. 35, no. 8, Aug. 1919, pp. 368-370, 7 figs. Combination of aneroid barometer and device called cyclonometer or wind disk. Used for foretelling coming of hurricane.

Stratosphere

See Wind Velocity.

Wind Velocity

Wind Velocity in the Stratosphere (Sur la vitesse du vent dans la stratosphère), J. Rouch. Comptes rendus des séances de l'Académie des Sciences, vol. 168, no. 25, June 23, 1919, pp. 1281-1283. Data obtained by aerologic soundings.

MILITARY AIRCRAFT

Bomb Dropping

The Science of Bomb Dropping from Airplanes, A. Wilmer Duff. Jl. Worcester Polytechnic Inst., vol. 22, no. 4, July 1919, pp. 322-338, 2 figs. Technical discussion of principles involved.

Naval Aircraft

Progress in Naval Aircraft—I, J. C. Hunsaker. Am. Mach., vol. 51, no. 7, Aug. 14, 1919, pp. 305-311, 4 figs. Also U. S. Naval Inst. Proc., vol. 45, no. 198, Aug. 1919, pp. 1347-1368, 8 figs. Tells of causes leading up to building of N C boats and gives some details of their design, construction and performance. Paper presented before Soc. of Automotive Engrs.

Torpedoplane

The Torpedoplane—The New Weapon which Promises to Revolutionize Naval Tactics, Henry Woodhouse. Flying, vol. 8, no. 7, Aug. 1919, pp. 597-602, 9 figs. Account of mystery airplanes of British Navy as given by various periodicals and in various reports of the Admiralty.

PLANES

Austin "Whippet"

The Austin "Whippet." Flight, vol. 11, no. 33, Aug. 14, 1919, pp. 1076-1078, 7 figs. Single-seater tractor biplane with all-steel fuselage, folding wings, and no bracing wires.

B.A.T.

The B. A. T. Type F. K. 26 Transport Airplane. Aviation, vol. 7, no. 1, Aug. 1, 1919, pp. 22-23, 2 figs. Machine is tractor biplane fitted with cabin which affords accommodation for either four passengers or their equivalent weight in goods or mails.

Bristol

The Bristol Aeroplanes. Aerial Age, vol. 9, no. 23, Aug. 18, 1919, pp. 1049-1052, 8 figs. General features of design and records of performance.

Caproni

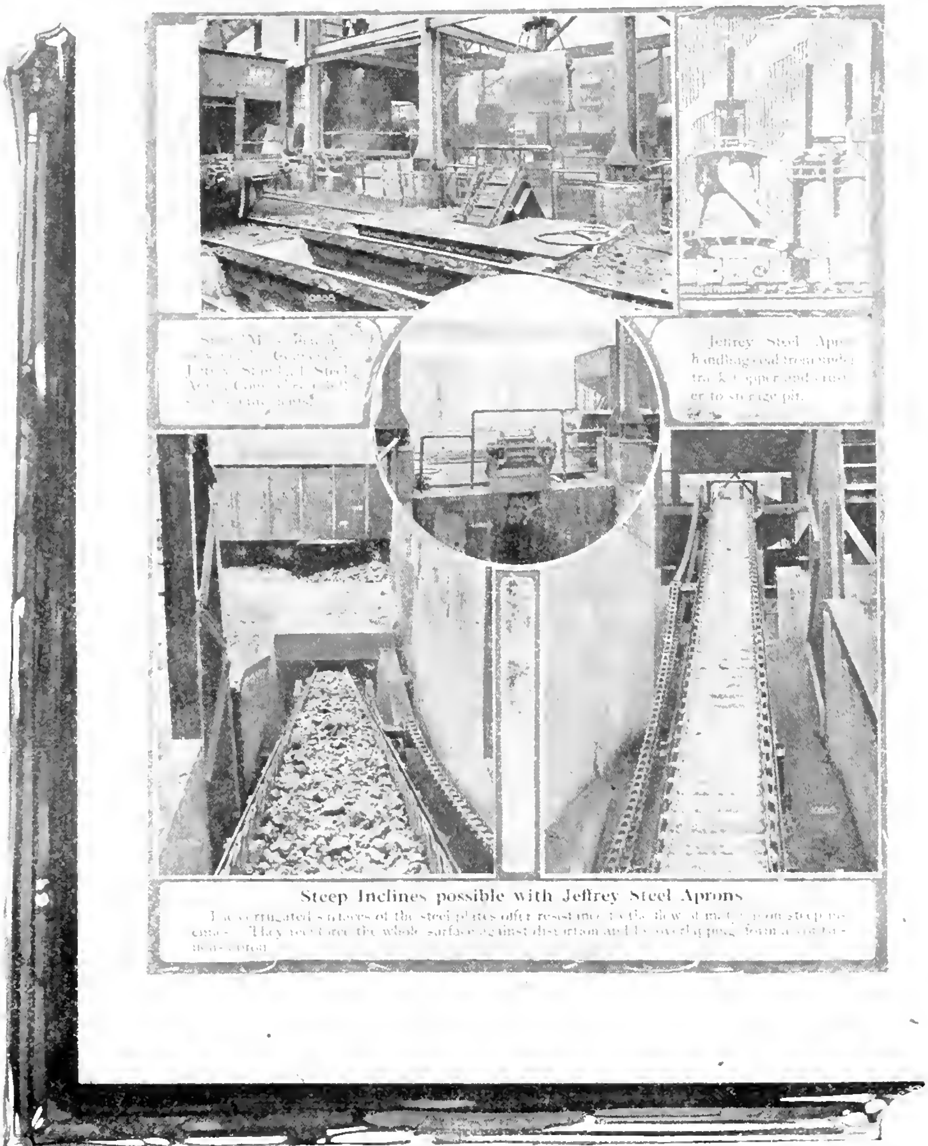
See Liberty Caproni.

De Havilland

The De Havilland Aeroplanes. Aerial Age, vol. 9, no. 21, Aug. 4, 1919, pp. 969-971 and 982, 3 figs. Comparison of various "Airco" types.

German Machines

The Large Land Airplane in German Practice, Erik Hildesheim. Aviation, vol. 7, no. 1,



A Specimen Page from Our New Catalog on Standard Apron Conveyers

This catalog contains 72 pages devoted to installations showing Standard Steel and Wood Apron Conveyers in service in Steel and Iron and other industries; Specifications, General Dimensions and other important data of vital interest to the purchaser. They are so arranged that you can easily select a conveyer which will completely meet your requirements.

This catalog will be of especial advantage to you in the saving of time and expense heretofore required in making drawings and layouts for your own particular needs. In addition to saving this expense you will be further benefited by quick delivery, and saving in cost of special designing, of chains, flights, etc., as under our system of Standardized Units all tools and patterns have been made, and chains, flights, etc., carried in stock.

Write today for copy of Catalog No. 258-L.

THE JEFFREY MFG. CO., 904 North Fourth Street, Columbus, O.

New York Philadelphia Scranton Chicago Detroit Dallas Denver Seattle
Cleveland Boston Pittsburgh St. Louis Birmingham Milwaukee Montreal

Handle it Mechanically

Aug. 1, 1919, pp. 23-25, 5 figs. Notes on development of giant airplane and outline of principal features of Linke-Hoffman machine.

Gosport Flying-Boats

The Gosport Flying-Boats. Flight, vol. 11, no. 31, July 31, 1919, pp. 1006-1009, 12 figs. Drawings and specifications of six commercial types which range from large ten-seater of over 100-ft. span to small single-seater of only 23 ft. span.

Liberty Caproni

The Liberty Caproni Biplane. Aerial Age, vol. 9, no. 24, Aug. 25, 1919, pp. 1089-1091 and 1108, 6 figs. General specifications and performances.

Linke-Hoffman

See German Machines.

Nieuport "Night Hawk"

The Nieuport "Night Hawk" Single-seater Scout—I. Engineer, vol. 128, no. 3319, Aug. 8, 1919, pp. 132-134, 8 figs. Fitted with 320-hp., nine-cylinder, fixed-radial, air-cooled A. B. C. "Dragon-Fly" engine. Designed to travel at 135 m.p.h. at altitude of 15,000 ft.

Vickers Vimy

The Vickers "Vimy-Commercial" Biplane. Flight, vol. 11, no. 29, July 17, 1919, pp. 936-941, 15 figs. Except for fuselage, machine is identical to "Vimy" bomber. Description is confined to fuselage.

War Developments

Some Developments in Aircraft Design and Application During the War, Lord Weir. Flight, vol. 11, nos. 29, 31 and 32, July 17, 31 and Aug. 7, 1919, pp. 955-959, 1013-1016 and 1048-1053, 42 figs. July 17: Aerodynamic features of progress and design. July 31: One-seater and two-seater fighters; progress in engine design. Aug. 7: Navigation and meteorology.

PROPELLERS

Aerodynamic Calculations

Aerodynamical Considerations in the Design of a Propeller, H. Levy. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 316-320, 10 figs. Method of calculating required dimensions and probable performance of propeller on basis of airfoil theory.

Wood Propellers

Some Problems in the Design of Wood Propellers, Leslie V. Spencer. Aerial Age, vol. 9, no. 23, Aug. 18, 1919, pp. 1053-1054 and 1059, 5 figs. Relative value of different woods. Advantages and disadvantages of different methods of blade tipping.

VARIA

Government Organization of Industry

Single Government Department for All Aeronautics Urged by Mission, Allen Sinsheimer. Automotive Industries, vol. 41, no. 7, Aug. 14, 1919, pp. 297-303, and pp. 323-327. Industry created by war fast disappearing, declares report of American Aviation Mission which has been studying European aeronautics. They urge establishment of agency equal to war department.

International Air Navigation Convention

International Air Navigation Convention. Flight, vol. 11, no. 31, July 31, 1919, pp. 1029-1032, 2 figs. Annexes dealing with marking of aircraft, rules as to lights and signals, international aeronautical maps and ground markings, collection and dissemination of meteorological information and customs. Additional to account given in issue of May 8.

Time Determination

An Easy Method of Getting the Greenwich Mean Time, Franklin Van Valdenburgh. U. S. Naval Inst. Proc., vol. 45, no. 198, Aug. 1919, pp. 1343-1345, 1 fig. Chart constructed by drawing lines representing loci of all places having same GMT at same time.

Tunnel, Aerodynamic

The Aerodynamic Experimental Tunnel, W. Knight. Aviation, vol. 7, no. 2, Aug. 15, 1919, pp. 77-80, 18 figs. Principles to be followed in designing, with notes of features adopted in tunnel built for Instituto Centrale Aeronautico in Rome.

Marine Engineering

SHIPS

Barges

Construction of Steel Barges, Thomas Leach. Proc. Engrs. Soc. Western Pa., vol. 35, no. 5, 275-282, 24 figs. Details of types being built for U. S. Railroad Administration for Erie June 1919, pp. 243-274 and (discussion) pp. Canal service.

Bulkhead Stiffeners

Investigation into Bulkhead Stiffeners—II. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 554-557 & 561, 1 fig. Calculation of stresses in bulkheads which form boundaries in trimming tanks, peak tanks or deep ballast tanks.

Cargo Vessels

S. S. Poughkeepsie, Standard 8,800-Ton Deadweight Cargo Vessel built by Newburgh Shipyards, Inc. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 531-535, 7 figs., partly on supp. plates. Two-deck, single-screw steamship fitted with water-tube boilers and geared turbines. Arranged for both coal and oil fuel.

New Type American Freighters. Mar. Rev., vol. 49, no. 9, Sept. 1919, pp. 413-414 and 437, 2 figs. Luckenbach steamers of 12,500 dead weight tonnage commandeered by U. S. Government.

SS. "Kediri." Shipbuilding & Shipping Rec., vol. 14, no. 3, July 17, 1919, p. 68, 2 figs., partly on supp. plates. Cargo vessel having capacity of 6,300 tons d.w. on 21 ft. 6 in. draft. Built in Holland.

Concrete Ships

The U. S. Shipping Board's Work with Concrete, J. Glaettli. Concrete, vol. 15, no. 2, Aug. 1919, pp. 69-72. In connection with designing concrete ships. Paper read before Am. Concrete Inst.

Concrete Ships, J. W. Sadler. Jl. Electricity, vol. 43, no. 3, Aug. 1, 1919, pp. 122-123, 2 fifs. Greater weight of concrete hull, and consequent need for lighter equipment indicate, writer believes, that electrical drive will be preferred for concrete ship.

Structural Action of Concrete Ship Members, W. A. Slater. Contract Rec., vol. 33, no. 32, Aug. 6, 1919, pp. 749-753. Laboratory investigations and problems in design of concrete vessels, undertaken by Concrete Ship Section of Emergency Fleet Corpn. in coöperation with U. S. Bur. Standards. Paper read before Am. Concrete Inst.

Electric Propulsion

A General Description of the Electric Propulsion of the U. S. S. California. Pacific Mar. Rev., vol. 16, no. 8, Aug. 1919, pp. 131-136, 12 figs., partly on supp. plates. Machinery is to consist of two turbo-generators, operating four motors, one connected with each line of shafting.

The Electric Plant of the Battleship Tennessee, R. L. Weber. U. S. Naval Inst. Proc., vol. 45, no. 198, Aug. 1919, pp. 1397-1408, 5 figs. Discussion is confined to ship's propelling machinery.

Freighters

See Cargo Vessels.

Mother Ships for Airplanes

H. M. S. "Furious." Engineering, vol. 108, no. 2798, Aug. 15, 1919, pp. 203-204, 6 figs. Partly on two supplement plates. Adopted as floating platform for flying ships. Dimensions and particulars.

Motor Ships

Italian Motorship Ansaldo San Giorgio I, Arthur Benington. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 525-529, 7 figs. Vessel is of single-deck type and is designed to leave cargo holes entirely unobstructed by pillars or stanchions.

Motor Tugs

Motor Tug "Grove Place." Shipbuilding & Shipping Rec., vol. 14, no. 7, Aug. 14, 1919, pp. 181-182, 3 figs. Length, 55 ft.; breadth, 14 ft.; depth, 8 ft. Used for Thames service.

Ore Carriers

Ore Carriers for Ocean Service, V. G. Iden. Mar. Rev., vol. 49, no. 9, Sept. 1919, pp. 420-423, 5 figs. Being built by Bethlehem Steel Corporation. They are 11,669 dead-weight tons each, are equipped with geared turbines capable of 2,400 shaft hp., and are specially designed to facilitate loading.

Oil-Fuel Installation

Oil Fuel Installation in Passenger Steamships. Shipbuilding & Shipping Rec., July 31, 1919, vol. 14, no. 5, pp. 123-124. Instructions issued by British Board of Trade.

Sediment in Marine Boilers

Sediment in Marine Boilers, W. R. Austin. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 552-553, 1 fig. Quotes three instances where sediment may cause trouble.

TERMINALS

Motor Trucking

Motor Trucks and the Problem of Efficient Marine Freight Terminal Operation—I, Merrill C. Horine. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 518-524, 9 figs. Survey of terminal operation field. Interrelation of carriers, railroads, transfer drays and steamship.

VARIA

Charts

The World's Air and Ocean Routes, B. J. S. Cahill. Pacific Mar. Rev., vol. 16, no. 8, Aug. 1919, pp. 90-92, 2 figs. Illustrating illusion of distance and direction on Mercator's chart.

Japanese Shipbuilding

1853—A Brief History of Japanese Shipbuilding—1919, Andrew Farrell. Pacific Mar. Rev., vol. 16, no. 8, Aug. 1919, pp. 71-79, 19 figs. Particularly as affected by policy of Japanese Government.

YARDS

Concrete Shipyards

Layout and Equipment of Government Concrete Ship Yards, A. L. Bush. Concrete, vol. 15, no. 2, Aug. 1919, pp. 73-77, 4 figs. Noting specially standardized schemes adopted for various structures.

Cost Accounting

Uniform Cost Accounting in Ship Building, J. L. Jacobs. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, pp. 539-543. Plan adopted by Atlantic Coast Shipbuilders' Assn. for uniform methods of cost accounting in steel shipbuilding.

A Cost System for Shipyards—II, Creighton Churchill. Int. Mar. Eng., vol. 24, no. 8, Aug. 1919, 545-548. Symbols used in collecting cost data.

Fore River

Shipbuilding Equipment and Methods at Fore River II—Shop Routing and Group Labor Systems. Eng. News-Rec., vol. 83, no. 8, Aug. 21, 1919, pp. 362-365, 2 figs. Features specially noted are shop routing system which schedules and keeps track of hull material from mold loft to berth, and special group labor system which has been applied to many of outside departments, chiefly the fitting-out and trial departments.

The Fore River Plant of the Bethlehem Shipbuilding Corporation, Ltd., Austin E. Potter. Rudder, vol. 35, no. 8, Aug. 1919, pp. 358-362, 9 figs. Details of organization.

Industrial Technology

Acetylene

Acetylene, R. A. Witherspoon. Can. Chem. Jl., vol. 3, no. 8, Aug. 1919, pp. 250-253. General properties and its application in industry.

See also Carbide.

Alcohol

Notes on the Production of Synthetic Alcohol, E. K. Rideal. Chem. Age, vol. 1, no. 1, June 21, 1919, pp. 9-11, 1 fig. Potentialities of wood cellulose as raw material.

Asphalt

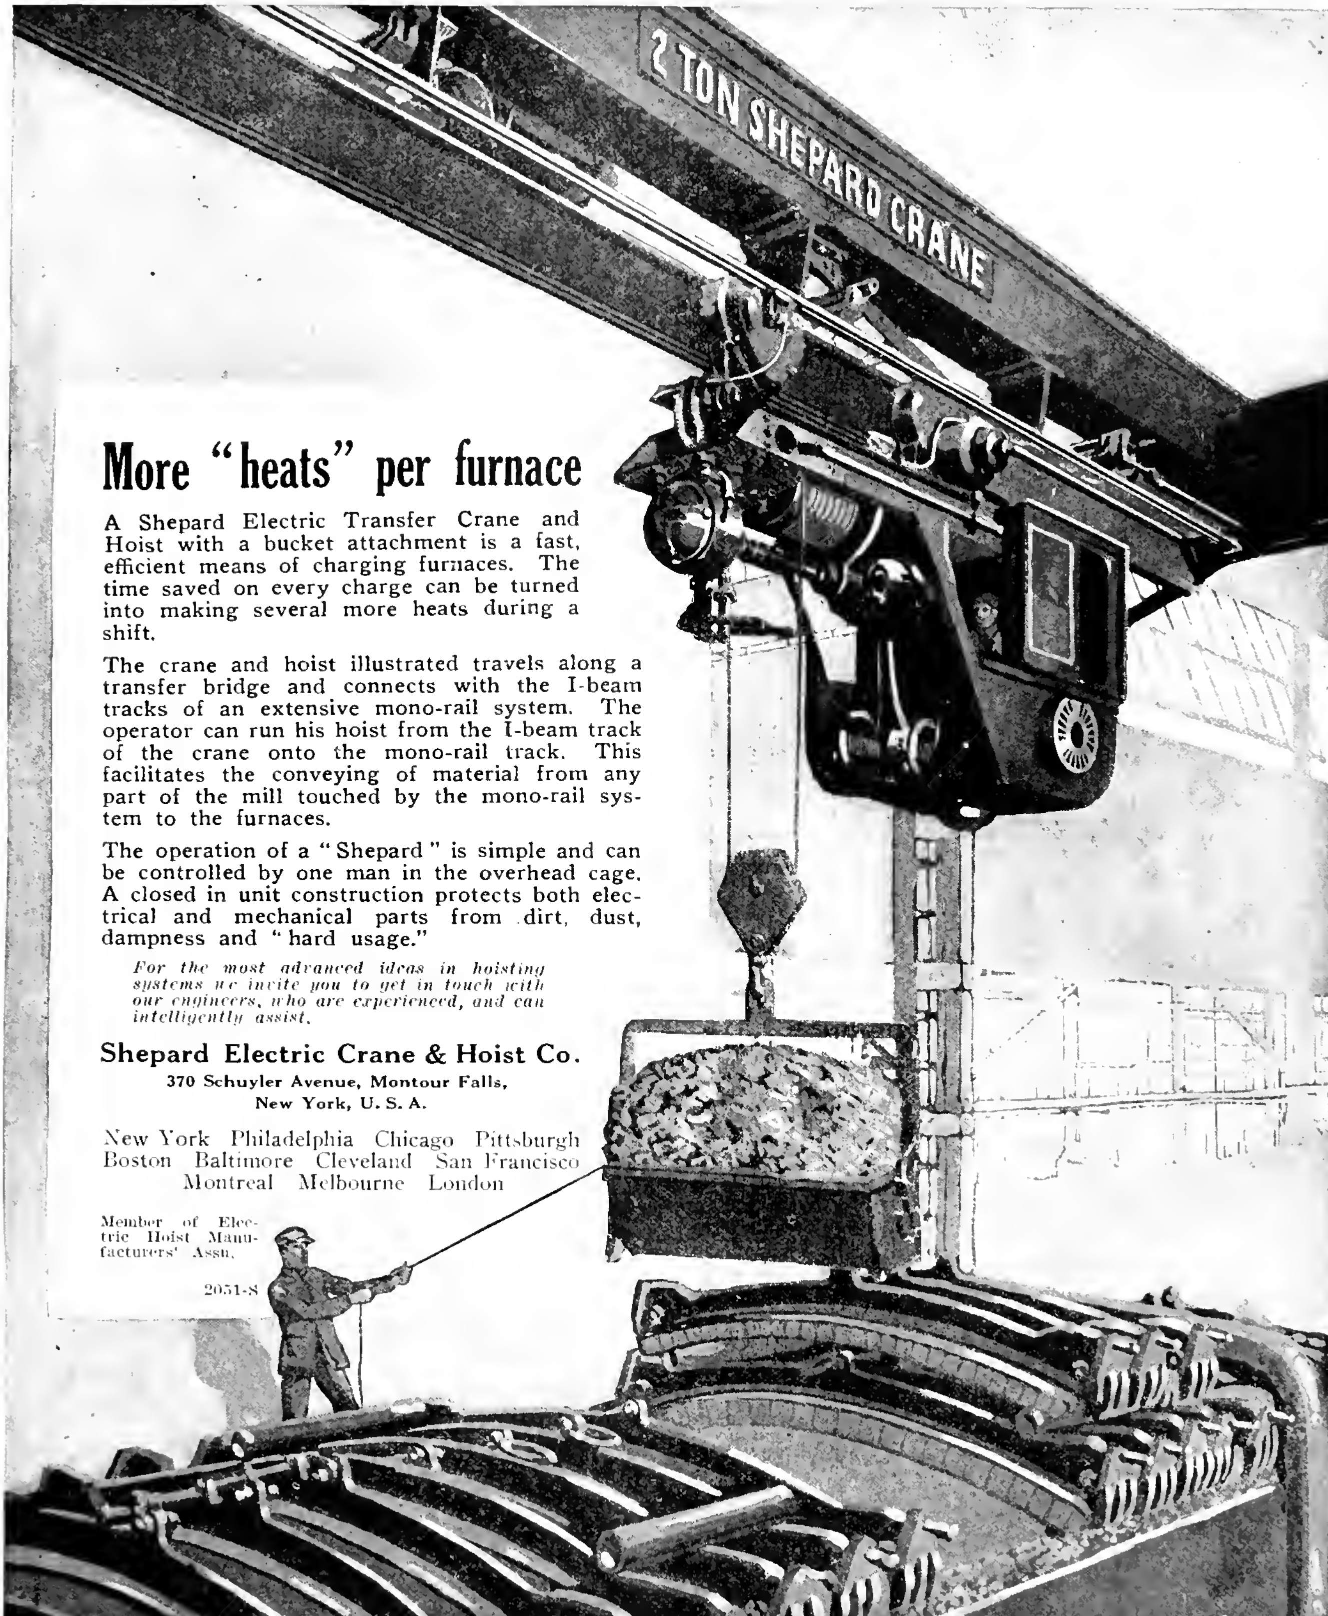
The Municipal Asphalt Plant of the District of Columbia, G. B. Hunt. Am. City, City Edition, vol. 21, no. 2, Aug. 1919, pp. 119-120, 2 figs. Record of operation for 1918, with cost data.

Bleaching

See Cotton Bleaching.

Calcination

See Gypsum.



2 TON SHEPARD CRANE

Carbide

The Canada Carbide Company, Limited. J. C. King. Can. Chem. Jl., vol. 3, no. 8, Aug. 1919, pp. 262-264, 2 figs. Brief history of carbide industry and description of its growth and development at Shawinigan Falls.

Cellulose

Reactions of Cellulose. Florence B. Seibert and Jessie E. Minor. Paper, vol. 24, no. 23, Aug. 13, 1919, pp. 15-20, 4 figs. Study of development of oxycellulose in papermaking.

Chemical Industry, American

The Economic Status of American Chemical Industry. Frederick E. Breithut. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 129-131, 10 figs. Charts based on specifications given in Census of Manufacturers for 1914.

Chemicals, Prices

Prices of Chemicals During the War. Frederick E. Breithut. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 174-176, 2 figs. Charts showing movement away from pre-war level.

Chlorine

The Nelson Electrolytic Chlorine Cell. C. F. Carrier, Jr. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 133-136, 4 figs. History, description and record of commercial application. From paper read before American Electrochemical Soc.

Electric Installations of Works Manufacturing Chlorine (Les installations électriques de l'usine "Le Chlore Liquide"), Jacques de Soucy. Chimie & Industrie, vol. 2, no. 6, June 1919, pp. 627-640, 13 figs. Current supplied at 26,000 volts is stepped down to 3200 volts and partly to 1850 volts.

Coal Tar

Continuous Process for Distilling Coal Tar. Gas Age, vol. 44, no. 4, Aug. 15, 1919, pp. 149-152, 11 figs. Description of plant erected at Gas Works of Geneva, Switzerland. From Journal des Usines & Gaz.

Column Apparatus

Column Apparatus in Chemical Industry, Sydney J. Tungay. Chem. Age, vol. 1, no. 1, June 21, 1919, pp. 11-14, 6 figs. Discussion of principles regarding use of towers, columns and filling materials manufactured from acid-resisting iron. Special reference is made to type to distillation and washing column patented by Kubierschky.

Cotton Bleaching

Bleaching of Cotton (Blanchiment du Coton). Robert Weiss. Bulletin de la Société Industrielle de Mulhouse, vol. 84, no. 6, Oct.-Nov.-Dec. 1914, pp. 499-506. Experiments with strontium as substitute for lime.

Crucibles

See Graphite.

Cyanides

The Recovery of Cyanides from Coal. Chem. Age, vol. 1, no. 4, July 12, 1919, pp. 90-92, 1 fig. Extraction process of hydrocyanic acid resulting from distillation of coal.

Glass

The Cooling of Optical Glass Melts, Howard S. Roberts. Jl. Am. Ceramic Soc., vol. 2, no. 7, July 1919, pp. 543-563, 7 figs. Conditions to be attained when melt of optical glass is cooled in the pot.

The Volatilization of Iron from Optical Glass Pots by Chlorine at high Temperatures, J. C. Hostetter, H. S. Roberts and J. B. Ferguson. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 356-372, 5 figs. Experiments said to have indicated beyond doubt that iron can be readily removed from pots by this method.

Glues

Water-Resistant Glues. F. L. Browne. Chem. & Metallurgical Eng., vol. 21, no. 3, Aug. 1, 1919, pp. 136-138, 3 figs. Including bibliography on casein and casein glues.

Graphite

Structure of Graphite in Relationship to Crucible Making. Reinhardt Thiessen. Jl. Am. Ceramic Soc., vol. 2, no. 7, July 1919, pp. 508-542, 39 figs. Crucibles containing Ceylon graphite were examined; also English crucible containing Madagascar graphite, several American crucibles containing American graphite and one Japanese crucible of unknown graphite origin. They all showed flake formation excepting Ceylon graphite, which evidenced granular form.

Effect of Variable Pressure and Tar Content on the Briquetting of Alabama Graphite. R. T. Stull and H. G. Schurecht. Jl. Am. Ceramic Soc., vol. 2, no. 5, May 1919, pp. 391-399, 8 figs. Results of experiments.

Gypsum

Gypsum Wall Plaster of France. C. F. Columbia. Cement, Mill & Quarry, vol. 15, no. 3, Aug. 5, 1919, pp. 17-19. Methods of extraction and account of French process of calcination.

Hydrocyanic Acid

See Cyanides.

Japans

Water Japan. Wheeler P. Davey. Gen. Elec. Rev., vol. 22, no. 8, Aug. 1919, pp. 634-635. Characteristics of emulsion. Electric-dip and hot-dip methods for applying it.

Leather

Leather from the Sea, Robert G. Skerrett. Sci. Am., vol. 121, no. 8, Aug. 23, 1919, pp. 182-183, 2 figs. Work done in adaptation of skins of sharks, rays, dogfish, backfish, etc., to general purposes of leather worker.

Oils

Suggestions Regarding the Selection of Drying Oils, Henry A. Gardner. Educational Bur., Scientific Section, Paint Manufacturers' Assn. of U. S., no. 66, Aug. 1919, 3 pp. Including contents of specifications for raw, boiled, and refined linseed oils, as recommended by the U. S. Interdepartmental Committee on Standardization of Paint Specifications.

Soya Oil, Henry A. Gardner. Educational Bur., Scientific Section, Paint Manufacturers' Assn. of U. S., no. 67, Aug. 1919, 16 pp. Summary of data regarding composition, physical properties and industrial uses.

Marine Animal Oils in Paints and Varnishes, Henry A. Gardner. Educational Bur., Scientific Section, Paint Manufacturers' Assn. of U. S., no. 68, Aug. 1919, 7 pp. Survey of results obtained and practices developed by various investigators.

Driers for Soya Oil, Henry A. Gardner. Educational Bur., Scientific Section, Paint Manufacturers' Assn. of U. S., no. 69, Aug. 1919, 12 pp. It is concluded as result of experiments that raw soya oil may be dried almost as rapidly as boiled linseed oil. Drier combinations that produce best results are given.

Paper

Paper Pulp Manufacture in Australia. Gerald Lightfoot. Paper, vol. 24, nos. 23 and 24, Aug. 13 and 20, 1919, pp. 22-23 and 27-30. Aug. 13: Investigation of possibilities of production prompted by shortage of raw materials. Aug. 20: Investigations on pulping qualities of Young Kutri timber.

Paper Mill Bark As Tanning Material. Vance P. Edwardes. Paper, vol. 24, no. 24, Aug. 20, 1919, pp. 18-21, 1 fig. The utilization of waste hemlock bark from pulp mills for tanning purposes. Experiments at Forest Products Laboratory.

Peat-Fuel Process

Willmarth Peat Fuel Process, C. A. Willmarth. Jl. Am. Peat Soc., vol. 12, no. 3, July 1919, pp. 113-122, 5 figs. For making peat coke and extracting by-products.

Photography

The Crystallography and Optical Properties of the Photographic Sensitizing Dye, Pinaverdol, Edgar T. Wherry and Elliot Q. Adams. Jl. Wash. Acad. Sci., vol. 9, no. 14, Aug. 19, 1919, pp. 396-405, 4 figs. This dyestuff, formerly made only in Germany, is now being produced in England and the U. S.

Potash

American Potash. Herbert H. Roe. Min. & Sci. Press, vol. 119, no. 6, Aug. 9, 1919, pp. 195-202, 11 figs. Review of recent achievements.

Potash Recovery at Cement Plants, Alfred W. G. Wilson. Canada Dept. Mines, bul. no. 29, May 6, 1919, 34 pp., 10 figs., partly on supp. plates. Based upon investigations undertaken under instructions from chairman of Committee of Reconstruction and Development of the War Trade Board.

The Alsatian Potash Industry, Frank K. Cameron. Am. Fertilizer, vol. 51, no. 4, Aug. 16, 1919, pp. 49-54. Cubic contents of potash estimated as 275,000,000 tons.

The International Potash Situation. Chem. Age, vol. 1, no. 5, July 19, 1919, pp. 131-133. Statistics and war time experience. Pre-war and future cost of production; natural deposits outside Germany; potash from felspars, leucites, etc.

Rubber

Chemistry of Rubber, S. C. Bradford. Sci. Am. Supp., vol. 88, no. 2275, Aug. 9, 1919, pp. 82-83. Historical account of researches and constitution and inventions relating to process of vulcanization.

Crude Rubber to the Front. Raw Material, vol. 1, no. 5, July 1919, pp. 246-251. Varieties of crude rubber, their trade names, qualities and market forms.

The Nature of Vulcanization, H. P. Stevens. Jl. Soc. Chem. Indus., vol. 38, no. 13, July 15, 1919, pp. 192T-196T. Two theories noted: (1) vulcanization is primarily an absorption process, or (2) a chemical combination of sulphur with rubber hydrocarbon. Writer quotes experiments undertaken to determine whether or not technical effect of vulcanization can be produced without chemical combination between sulphur and hydrocarbon taking place.

Sulphate of Ammonia

Report of Alkali Works Inspector. Iron & Coal Trades Rev., vol. 99, no. 2683, Aug. 1, 1919, pp. 146-147. Concerning production for 1918 of sulphate of ammonia in bulk as by-product.

Tannin

Hemlock Bark as a Source of Tannin, Vance P. Edwardes. Chem. Engr., vol. 27, no. 8, Aug. 1919, pp. 178-182, 1 fig. Results of investigations conducted by Forest Products Laboratory.

See also Paper.

Tetrachlorethylene

Preparation of Tetrachlorethylene, H. B. Weiser and G. E. Wightman. Jl. Phys. Chemistry, vol. 23, no. 6, June 1919, pp. 415-439. Survey of results obtained by various investigators and account of experiments undertaken by writers.

Wood Distillation

A New Method of Distilling Both Green and Seasoned Hardwoods. Chem. & Metallurgical Eng., vol. 21, no. 4, Aug. 15, 1919, pp. 193-194. Chief point of advantage claimed for process used by Kingsport Wood Reduction Company is method of briqueting sawdust or finely divided woodwaste and of distilling wood briquets under controlled conditions of temperature and pressure in multitubular retorts.

Railroad Engineering

FOREIGN

African Railways

African Railway System (La gran red de ferrocarriles africanos). D. Enrique Morales. Revista de Obras Publicas, vol. 67, no. 2283, June 26, 1919, pp. 305-309. Economic significance of establishing direct railway service between Europe and Africa through Strait of Gibraltar. (Concluded.) Paper read before Spanish Inst. of Civil Engrs.

British Railway Shops

British Railway Workshops in War Time—IV. Engineer, vol. 128, no. 3318, Aug. 1, 1919, pp. 104-105, 3 figs. Insulated meat van designed for use overseas.

French Railways

The Reconstruction Program for French Railways.-II. Robert E. Thayer. Ry. Age., vol. 67, no. 6, Aug. 8, 1919, pp. 251-255, 9 figs. Standards for types of material and equipment used on railroads, developed by Ministry of Public Works.

Venezuela

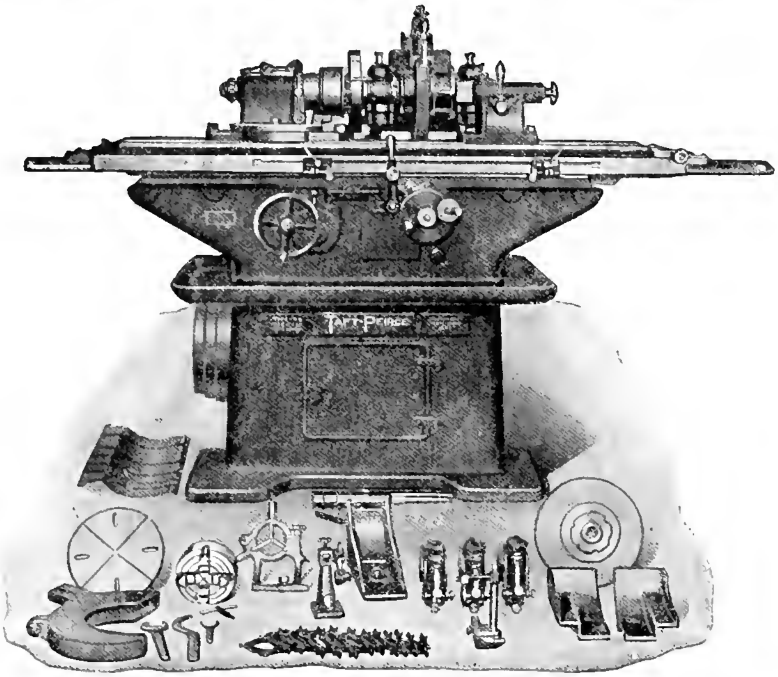
The Railways of Venezuela, Charles W. Jones. Ry. Rev., vol. 65, no. 6, Aug. 9, 1919, pp. 181-185, 7 figs. Survey of adverse conditions to be encountered makes it manifest, in writer's opinion, that Venezuela offers small inducements of investment of foreign capital in new railway lines, except under strict governmental guarantees faithfully fulfilled.

CONSTRUCTION

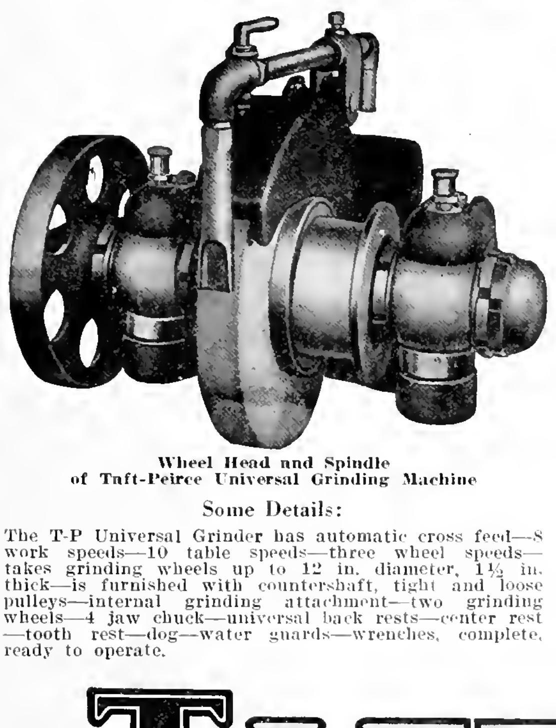
Bridges

Elevating Illinois Central Tracks and Building the New Bridges, W. T. Christine. Eng. World, vol. 15, no. 3, Aug. 1, 1919, pp. 15-19, 9 figs. Fill necessary aggregated more than 550,000 cu. yd. Bridges are of reinforced-concrete construction.

Universal Grinding Machine



The Taft-Peirce No. 2 Universal Grinding Machine, 10-in. x 30-in. Capacity



Wheel Head and Spindle
of Taft-Peirce Universal Grinding Machine

Some Details:

The T-P Universal Grinder has automatic cross feed—8 work speeds—10 table speeds—three wheel speeds—takes grinding wheels up to 12 in. diameter, 1½ in. thick—is furnished with countershaft, tight and loose pulleys—internal grinding attachment—two grinding wheels—4 jaw chuck—universal back rests—center rest—tooth rest—dog—water guards—wrenches, complete, ready to operate.

A compact, versatile machine for straight or tapered, plain, cylindrical or internal grinding.

Eight spindle speeds and ten table feeds provide capacity for a wide range of work and at the same time extreme accuracy of grinding.

A disc clutch and brake are provided in the head stock so that the spindle can be stopped and started at will, without stopping any part of the countershaft.

Send for descriptive bulletin No. 103N.

TAFT-PEIRCE
Woonsocket, R.I., U.S.A.

New York: Woolworth Building
Chicago: 6701 East End Ave.

Detroit: Majestic Building
Cleveland: 10708 Hampden Ave.

TAFT-PEIRCE PRODUCTS CARRIED IN STOCK BY

Syracuse Supply Company, Syracuse, Buffalo, Rochester 2068

Cadillac Tool Co., Detroit Wm. M. Pattison Supply Co., Cleveland Sherritt & Stoer Co., Philadelphia

Track Work

Track Special Work of the Municipal Railways of San Francisco, Leslie W. Stocker. Elec. Traction, vol. 15, no. 8, Aug. 1919, pp. 500-503, 3 figs. Development of standards of material and workmanship.

Labor Saving Devices for Railway Track Work. Can. Ry. and Mar. World, no. 258, Aug. 1919, pp. 421-424, 5 figs. Committee report presented at annual meeting of Roadmasters' and Maintenance of Way Assn.

Track Elevation on the Indianapolis Union Railroad. Eng. News-Rec., vol. 83, no. 6, Aug. 7, 1919, pp. 265-266, 2 figs. Methods necessitated in consequence of traffic of 165 trains daily.

Kanawha & West Virginia

The Kanawha & West Virginia Builds a New Line. Ry. Age, vol. 67, no. 7, Aug. 15, 1919, pp. 297-299, 5 figs. Remarking specially heavy grading involved.

ELECTRIC RAILROADS

Drop in Voltage

Drop in Volts for Track or Steel Conductors, E. Goolding. Tramway & Ry. World, vol. 46, no. 3, July 17, 1919, pp. 16-18, 5 figs. Tables for simplifying calculations.

Generator Suspension

Why One Road Changed Its Generator Suspension, J. H. Burcham. Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 271-272, 4 figs. Modifications in method of suspending Bliss truck.

History of Development

Electric Railway Development, H. C. Eddy. Aera, vol. 7, no. 12, July 1919, pp. 1187-1194, 19 figs. Historical account.

Locomotives

Electric Locomotives in the Express Service of Trunk Lines (Studien über elektrische Lokomotiven im Schnelizugsdienste der Vollbahnen). Elektrotechnische Rundschau, vol. 36, nos. 5-6, and 7-8, Feb. 5 and 19, 1919, pp. 18-20 and 27-28, 2 figs. Comparison between steam and electric service on line between Tours and Paris.

ELECTRIFICATION

Argentine

Electrification of Central Argentine Railway (La traction électrique sur le chemin de fer central argentin). Revue Générale de l'Electricité, vol. 6, no. 3, July 19, 1919, pp. 77-83, 3 figs. Comprises central station of 15,000 kw. and 60 miles of high-tension transmission lines, 5 sub-stations and electric equipment for 100 miles of single track. A. c. generated at 20,000 volts and converted to d. c. at 800 volts for traction purposes.

Electrification

Railroad Electrification (Electrificacion de ferrocarriles), Jose Luis Valenti y Dorda. Revista de Obras Públicas, vol. 67, nos. 2284 and 2286, July 3 and 17, 1919, pp. 317-321 and 344-349. Technical advantages and comparison with steam operation. Economical advantages.

Railroad Electrification Facts and Factors, A. J. Manson. Ry. Elec. Engr., vol. 10, no. 8, Aug. 1919, pp. 277-279, 2 figs. Auxiliary apparatus required in the locomotive in addition to the main driving motors.

Electrification of Federal Railways (Electrification des chemins de fer fédéraux). Bulletin Technique de la Suisse Romande, vol. 45, no. 14, July 12, 1919, pp. 133-136, 8 figs. Tests of Hoeter concrete poles. (Concluded.)

Great Britain

The Electrification of British Railways, F. W. Carter. Electrical Review, vol. 85, no. 2173, July 18, 1919, pp. 68-69. Included in program of reconstruction drawn up by Minister-designate of Ways and Communications not merely because "of the service it can render or of the saving it can effect," but because "electrical operation can show advantages over all other methods." (To be concluded.)

Operation

Some Possibilities of Steam Railway Electrification as Affecting Future Policies. Ry. Gaz., vol. 31, no. 2, July 11, 1919, pp. 56-57. Electrification is considered as offering a fundamentally different method of train propulsion because it is said limitation of steam locomotive disappears and the strictly limited motive power is replaced by one that is practically unlimited. Consequent modifications in railroad operation are visualized.

Overhead Construction

Overhead Construction in Electric Railways (Elektrische Bahnen). Elektrotechnik u. Maschinenbau, vol. 37, no. 1, Jan. 5, 1919, pp. 11-12, 6 figs. German and Austrian patents relating to catenary suspension.

Sweden

Electrification Work to be Pushed Forward in Sweden. Elec. Ry. Jl., vol. 54, no. 5, Aug. 2, 1919, pp. 225-227. Government aid for water-power development.

EQUIPMENT

Loading Table

A Standard Loading Table for British Railway Bridges, Conrad Gribble. Ry. Gaz., vol. 31, no. 4, July 25, 1919, pp. 116-118, 2 figs. Establishes that a complete loading table for bridges should consist of a series of conventional train loads, and a set of tables giving (1) equivalent uniformly distributing loads for bending moment, (2) maximum shears at center and end of spans, and (3) maximum concentrations on cross-girders of various spacings.

Turntables

New Turntable for the Pennsylvania Railroad. Ry. Rev., vol. 65, no. 4, July 26, 1919, pp. 117-121, 12 figs. Three-point-supporting turntable with vertical adjustable center bearing.

LOCOMOTIVES

Locomotive Failures

Injuries from Locomotive Failures, John L. Mohun. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 458-463, 2 figs. Suggestions for their reduction based on examination of Interstate Commerce Commission locomotive inspection reports.

Mallet Heavy

Carolina, Clinchfield & Ohio Freight Locomotives. Ry. Age, vol. 67, no. 7, Aug. 15, 1919, pp. 317-319, 4 figs. Mallet heavy 2-8-8-2 type with tractive effort of 103,560 lb. and total weight in working order of 523,600 lb. on drivers.

Heavy Mikado and Mallet Type Locomotives, Ry. Rev., vol. 65, no. 4, July 26, 1919, pp. 122-123, 2 figs. Comparison of Carolina, Clinchfield & Ohio Ry. types with similar ones of the U. S. Railroad Administration standards.

Pensylvania Mallet Compound Locomotive. Ry. Rev., vol. 65, no. 5, Aug. 2, 1919, pp. 157-159, 4 figs. Capable of exerting 100,000-lb. tractive power and designed to operate over maximum grades of 5 per cent and around curves of 18 deg. radius.

Rail Loads

Internal Disturbing Forces and Variations in Rail Load. Ry. Gaz., vol. 31, no. 2, July 11, 1919, pp. 63-65, 3 figs. Forces due to cylinder incline and finite connecting-rod length, with particular reference to three-cylinder locomotives.

Spark Arresters

Prevention of Forest Fire Losses, Smith Riley. Am. Forestry, vol. 25, no. 308, Aug. 1919, pp. 1260-1263, 7 figs. Form of spark arrester which has been employed with success on locomotives in Colorado.

Stoking, Mechanical

Mechanical Stoking of Locomotives, W. S. Bartholomew. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 465-469, 6 figs. Factors determining necessity of applying stokers; operating results secured by stoker firing.

Valve Gears

The Metamorphosis of the Locomotive—II, III, H. Holcroft. Engineer, vol. 128, no. 3318-3319, Aug. 1 and Aug. 8, 1919, pp. 103-104, and 126-129, 6 figs. Valve gears for variable-expansion and compound locomotives.

MAINTENANCE

Piles, Creosoted

An Unusual Record for Creosoted Piles. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 278-280, 1 fig. Over 14,000 creosoted piles said to have been in service in Southern Pacific Long Wharf at Oakland, Cal. for periods ranging from 22 to 29 years. Notes on their condition and treatment they received.

Terminal Tracks

The Correct Maintenance of Terminal Tracks J. B. Baker. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 275-276, 1 fig. Methods and practice of Pennsylvania Railroad.

Track Chisel

The Use and Abuse of the Track Chisel, Howard C. Mull. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 264-265, 5 figs. Suggestions in regard to handling so as to prolong life of tools.

OPERATION AND MANAGEMENT

Alphalt Shipping

The Advantages of Tank Car Shipments of Asphalt, Charles E. Murphy. Eng. & Contracting, vol. 52, no. 6, Aug. 6, 1919, pp. 160-161, 3 figs. Claims tank-car shipments have proved to be economical, have reduced labor of transportation, and have effected quicker, safer and easier handling of materials. Rules for unloading are suggested.

Engineering Side of Operation

The Operation of Railways as an Engineering Problem, V. I. Smart. Jl. Eng. Inst. Can., vol. 2, no. 8, Aug. 1919, pp. 539-550, 9 figs. Emphasizes that actual use of means of transportation is just as much an engineering problem as is design, construction and care of means of transportation, and suggests that railroads utilize, in Transportation Department, men from these two recognized engineering departments.

Fair Value

Determining "Fair Value." Elec. Ry. Jl., vol. 54, no. 5, Aug. 2, 1919, pp. 222-225. Items to be considered in estimating fair value for rate making, as outlined by Com. of Am. Elec. Ry. Assn.

Principles Underlying Determination of "Fair Value." Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 425-428. Report of Committee on Valuation of Am. Elec. Ry. Assn. defining bases for appraising public-utility properties for rate making.

Junction Operation

Single Line working at Double Line Junctions. Ry. Gaz., vol. 31, no. 2, July 11, 1919, pp. 60-62, 9 figs. Examples of junction working during obstruction.

Passenger Traffic Analysis

Methods of Observing and Analyzing Passenger Traffic, R. H. Horton. Aera, vol. 7, no. 12, July 1919, pp. 1174-1181, 13 figs. Practice of Philadelphia Rapid Transit Co.

PERMANENT WAY AND BUILDINGS

Ashpits

Double-Track Water-Type Ashpit, Pennsylvania Railroad. Eng. News-Rec., vol. 83, no. 9, Aug. 28, 1919, pp. 408-410, 4 figs. Noting special consideration given to safety of men working at pit.

Embankments Sliding

Has the Real Cause of Sliding of Railroad Embankments Been Found? (Is de eigenlijke oorzaak van den spoorwegdam-afschuiving verklaard), J. M. K. Pennink. Ingenieur, vol. 34, no. 26, June 28, 1919, pp. 488-490. Writer criticizes conclusions arrived at by special committee appointed for this purpose by Dutch Government Dept. of Building and Hydraulics, and states his hypothesis.

Oil-Storage Tanks

The Storage of Railway Fuel Oil. Ry. & Locomotive Eng., vol. 32, no. 8, Aug. 1919, pp. 227-229, 1 fig. Dimensions and location of storage tanks.

Subgrade Construction

Concrete in Subgrade Construction. Ry. Maintenance Engr., vol. 15, no. 8, Aug. 1919, pp. 282-283, 12 figs. Installation in service under steam-railway tracks and results secured.

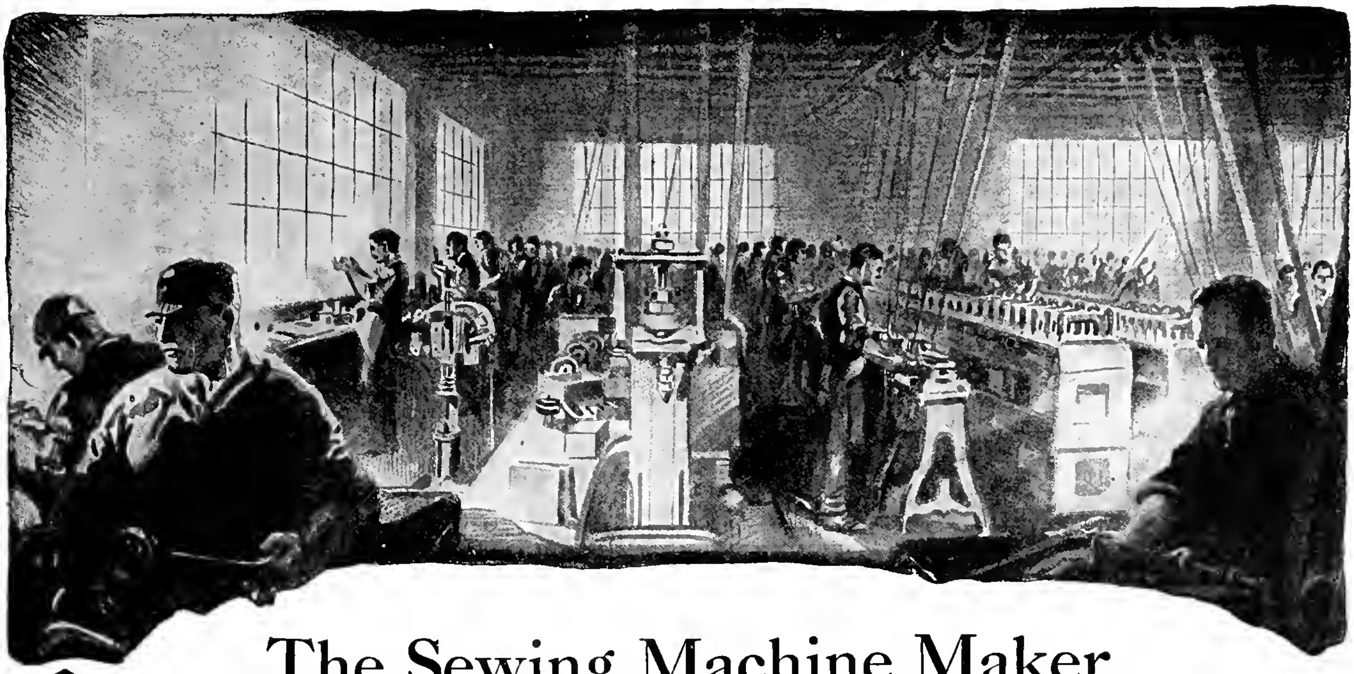
Terminal Tunnels

Montreal Terminal Tunnel from an Economic Point of View, H. K. Wicksteed. Ry. Rev., vol. 65, no. 5, Aug. 2, 1919, pp. 145-151, 7 figs. Paper read before Eng. Inst. of Canada.

Track Maintenance

War Time Progress in Maintenance of Way, John B. Tinnon. Elec. Ry. Jl., vol. 54, no. 5, Aug. 2, 1919, pp. 220-221. Writer believes that better track will result if less money is spent on construction and more on maintenance. Paper presented before Illinois Elec. Ry. Assn.

Maintenance of Permanent Way—II. Ry. Engr., vol. 40, no. 475, Aug. 1919, pp. 163-168, 2 figs. Concerning reballasting, relaying, resleepering and widenings. (Continuation of serial.)



The Sewing Machine Maker Who Made His Own Tools

Gun Tap

Acorn Die

Snap Gage

MANY manufacturers make their own screw-cutting tools—and believe they are saving money.

One of the largest sewing machine makers was among this number. Not until the problem of rising costs confronted him did he make a real investigation.

Then he sent for a GTD engineer.

The GTD man said, "Your machines can be assembled more quickly — and more cheaply—if the threaded parts are made better and more accurately."

To prove it, the GTD laboratories cut threads with Greenfield taps and dies and photographed them. Then they cut the same size threads with tools made by the manufacturer and photographed those.

The pictures at the bottom of this page tell the story. They convinced the manufacturer that he could not only *buy* better screw-cutting tools than he could *make*, and buy them cheaper, but that he could save thousands of dollars formerly lost through assembling difficulties caused by imperfect threads.

The Greenfield Tap & Die Corporation invites every manufacturer who is making his own taps and dies to try this experiment

Send to Greenfield a thread cut by your own tools and let it be *micro-shadographed* by our special high-powered projection cameras.

In nine cases out of ten the thread will be ragged and crude compared with the threads which GTD taps and dies produce.

This offer is a part of our service which enables manufacturers of machines, motors, implements and appliances, to make use of our 46 years of screw-cutting experience. The suggestions of our men may save you time, money and materials now being wasted.

Our booklet "Tools and Dividends" suggests ten questions every executive, plant superintendent or purchasing agent ought to ask. Your copy is ready for mailing.

GTD

Fig. 1—Projection photos revealed these imperfections in a screw thread. This screw was cut by tools made by a sewing machine maker for his own use, and supposed to be perfect.

Fig. 2—This screw was cut by a GTD tool. Its clean threads, when highly magnified, showed entire freedom from imperfections, ensuring an accurate easy fit in the parts of the machine.

GREENFIELD
TAP & DIE CORPORATION
Greenfield, Massachusetts, U.S.A.

World's Largest Manufacturers of Screw Cutting Tools

Track Supports, Concrete

Concrete Track Supports Cut Railway Maintenance Costs, A. C. Irwin. Concrete, vol. 15, no. 2, Aug. 1919, pp. 63-68, 16 figs. Types of construction proposed. Paper presented before Am. Concrete Inst.

RAILS

Rail Fissures

Limiting of Transverse Rail Fissures, Paul Kreuzpointner. Iron Age, vol. 104, no. 6, Aug. 7, 1919, pp. 360-362. Effect of non-diffusion of elements. Factors contributing to formation of fissures.

ROLLING STOCK

Box Cars

C. P. R. Double Sheathed Box Cars. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 475-477, 3 figs. Also Ry. Age, vol. 67, no. 6, Aug. 8, 1919, pp. 257-259, 4 figs. Length is 36 ft.; weight 39,500 lb.; have steel underframe, wood superstructure and metal roof.

Box-Car Reconstruction

Reconstruction of 5-ft. Gauge Box Car Equipment to Suit the Indian State Railway 5 ft. 6 in. Gauge. Ry. Gaz., vol. 31, no. 3, July 18, 1919, pp. 92-94, 4 figs. Quoted as example of possibilities of converting rolling stock from one gage to another.

Instruction Car

New Instruction Car for the Southern Pacific. Ry. Age, vol. 67, no. 8, Aug. 22, 1919, pp. 365-366, 2 figs. Equipment includes apparatus for presenting operating problems graphically to employees.

SAFETY AND SIGNALING SYSTEMS

Accident in Holland

Railroad Accident near the Bridge over the Merwede Canal on September 13, 1918 (Het verzakken van den spoorwegdijk bij de brug over het Merwedekanaal nabij Weesp op 13 September 1918), van den Thoorn. Ingenieur, vol. 34, no. 30, July 26, 1919, pp. 540-549, and (discussion) pp. 549-557, 11 figs. Report of Commission appointed by State Department of Building and Waterways Construction.

Block-Signaling Practice

Block Signaling Practice on a British Railway, F. B. Holt and A. B. Wallis. Ry. Signal Engr., vol. 12, no. 8, Aug. 1919, pp. 277-280, 2 figs. Use of electrically controlled ground frames, fouling bars, telephone and telegraph communication, automatic signaling, electrically operated switches and locomotive cab signaling on Midland Railway of England.

Statistics on Signals

I. C. C. Statistics and Tables on Signals. Ry. Signal Engr., vol. 12, no. 8, Aug. 1919, pp. 270-274, 1 fig. Annual report pertaining to block signals and telegraph and telephone transmission of orders.

SHOPS

Firebox Repairs

Jacobs-Shupert Firebox Repairs, H. Louis Hahn. Ry. Mech. Engr., vol. 93, no. 8, Aug. 1919, pp. 485-487, 5 figs. Methods and tools used to repair stay sheets and cracked and distorted sections.

Milling Practice

Milling Practice in Locomotive Shops, Edward K. Hammond. Machy. (N. Y.), vol. 25, no. 12, Aug. 1919, pp. 1122-1125, 7 figs. Methods of milling heavy forgings for the side rods, connecting rods and side frames of locomotives.

Repair Shops

The Design of Modern Locomotive Repair Shops, Gustave E. Lemmrich. Ry. Age, vol. 67, no. 6, Aug. 8, 1919, pp. 261-265, 3 figs. Study of considerations entering into an efficient layout for maintenance of engines.

Springfield Shops

New Springfield Shops of the Ohio Electric Railway. Elec. Traction, vol. 15, no. 8, Aug. 1919, pp. 473-478, 18 figs. Reinforced-concrete structures.

SPECIAL LINES

Lines with Steep Gradients

Safety Devices for Lines with Steep Gradients (Sicherungsvorrichtungen an Steilbahnen), Siegfried Abt. Zeitschrift für Kleinbahnen, vol. 26, no. 2, Feb. 1919, pp. 53-63, 26 figs. Anchors and brake tongs for cable railways on trestles; also anchors and guides for rack railways.

Narrow-Gage Railway Statistics

Statistics of Narrow-Gage Railways During 1915-1916 (Statistik der schmalspurigen Eisenbahnen für das Betriebsjahr 1915-1916), F. Zezula. Zeitschrift für Kleinbahnen, vol. 26, no. 2, Feb. 1919, pp. 64-94. Tables showing length of roadbed, capital invested per kilometer, type of railway, capacity and fuel consumption of locomotives (steam and electric) for Norweian, Swiss, and German railroads.

STREET RAILWAYS

Battery Exchange

Electric Vehicle Standardization, Hilding Lubeck. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 131-141, 7 figs. Particularly with a view to establishing system of battery exchange.

Coasting

Coasting Results on the Chicago Elevated, H. A. Johnson. Elec. Ry. Jl., vol. 54, no. 6, Aug. 9, 1919, pp. 277-279, 2 figs. Coasting has been increased to 35 per cent. First year of operation said to have shown saving of 21,162,217 kw.-hr.

Fare Handling

Mechanical Aids in Handling Fares. Elec. Ry. Jl., vol. 54, no. 5, Aug. 2, 1919, pp. 217-220, 6 figs. Detroit United Ry. uses labor-saving device which is said to permit sorting and counting of receipts with 25 per cent of force required for hand operation.

Fare Systems

Revolutionary Change in Public Service Railway Fare System. Elec. Ry. Jl., vol. 54, no. 6, Aug. 9, 1919, pp. 282-284. Mile zones, low initial zone charge and the elimination of transfers are important elements in new system.

Tramway Fares and Services, Wm. L. Magden, Electrical Review, vol. 85, no. 2175, Aug. 1, 1919, pp. 132-134. Discussing conditions in the United Kingdom, writer points out how it appears to him that controlling bodies have considerable responsibility for failure of tramway systems to produce adequate financial return to proprietors.

Rolling Stock

New Cars for Baltimore, A. T. Clark. Elec. Traction, vol. 15, no. 8, Aug. 1919, pp. 495-497, 3 figs. Arranged to operate in one, two or three-car units.

Telephone Traffic Control

Telephone Traffic Control for Tramways. Tramway & Ry. World, vol. 46, no. 3, July 17, 1919, pp. 9-14, 8 figs. Central control station in telephonic touch with officials all over the system.

A System of Railway Traffic Control by Telephone, T. F. Lee, Post Office Elec. Engrs. Jl., vol. 12, no. 2, July 1919, pp. 105-115, 7 figs. System used by one of largest English companies and which is said to be independent of "earth" connections and therefore not to any considerable extent affected by "earth" faults.

Zone Fares

The Zone Fare in Practice. London County Council I & II, Walter Jackson. Elec. Ry. Jl., vol. 54, nos. 5 & 6, Aug. 2 & 9, 1919, pp. 210-215 and 270-275, 15 figs. Lines said to be earning 40 cents per car mile. Fares were increased in May and June 1918 chiefly by introducing a three-section penny stage, averaging 1.8 miles and by abolishing children's and fractional fare tickets. Forms of Ticket Dept. Works.

Zone Fare Collection on Front-Entrance Center-Exit Cars. Elec. Ry. Jl., vol. 54, no. 7, Aug. 16, 1919, pp. 327-328, 2 figs. On interurban line between Youngstown and Warren, Ohio, Mahoning & Shenango Ry. & Light Co. uses plan involving two types of identification checks.

TERMINALS

Terminal Power Plants

Power Plant Operation on an Efficient Basis, Paul R. Duffey. Power, vol. 50, no. 9, Aug. 26, 1919, pp. 330-331. Deals principally with power plant of railroad terminal.

Munitions and Military Engineering

Ballistics

Equations of Differential Variations in Exterior Ballistics, W. E. Milne. Jl. U. S. Artillery, vol. 51, no. 2, Aug. 1919, pp. 154-159, 1 fig. Suggested modifications in method of derivation devised by F. R. Moulton.

Trajectories and Their Corrections, A. G. Kirk. U. S. Naval Inst. Proc., vol. 45, no. 198, Aug. 1919, pp. 1375-1395, 7 figs. Method of computation by mechanical integration.

Camouflage

The Dazzle Paintings of Ships, Norman Wilkinson. Engineering, vol. 108, no. 2797, Aug. 8, 1919, pp. 192-195, 5 figs. Origin and development, and reasons for its adoption as opposed to painting a ship with a view to achieving invisibility.

Chemical Warfare

Innovations of the Recent War, William L. Sibert. Jl. Cleveland Eng. Soc., vol. 11, no. 5 & 6, Mar.-May 1919, pp. 272-281. Chemical work involved, particularly in connection with gas warfare, with notes on policy followed by Chemical Warfare Service.

Chronograph

The Aberdeen Chronograph. Sci. Am., vol. 121, no. 6, Aug. 9, 1919, pp. 131 and 145, 5 figs. Device for timing flight of projectile developed by Army Ordnance Dept.

Coast Defense

Coast Defenses Constructed by the Germans on the Belgian Coast, Augustus Norton and Donald Armstrong. Jl. U. S. Artillery, vol. 51, no. 2, Aug. 1919, pp. 160-181, 35 figs. Battery on Belgian coast consisted of four 28-cm. guns.

Discussion of Method of Indirect Firing for Coast Defense (De toepassing van de methode der indirecte richting bij kustgeschut), H. D. S. Hasselman and P. Post Uiterweer. Artilleristisch Tijdschrift, no. 8, Aug. 1919, pp. 474-489, 1 fig.

Explosion of Charges at Sea

Science and Its Application to Marine Problems, J. C. McLennan. Engineer, vol. 128, no. 3317, July 25, 1919, p. 92. Investigations of characteristics of pressure waves generated by explosion of charges in sea. (Concluded). Paper read before North East Coast Instn. of Engrs. and Shipbuilders.

Gun Mounts

Building 5-inch Gun Mounts at Brantford, J. H. Moore. Can. Machy., vol. 22, no. 6, Aug. 7, 1919, pp. 143-145, 7 figs. Milling operations and inspection. Second installment.

See also Naval Guns.

Gun Operation

Operations on the British 9.2-in. Gun—I, II, III, William Chubb. Am. Mach., vol. 51, nos. 6, 8 and 9, Aug. 7, 21 and 28, 1919, pp. 275-280, 373-377 and 423-427, 26 figs. Aug. 7: Noting particularly difference in production operations from practice on ordnance in United States. British 9.2 army gun is very similar in design and construction to guns of British navy. Aug. 21: Manufacture of various sizes of rings from one forging by combined processes of trepanning, turning and boring. Aug. 28: Rifling, building and inspection.

Illuminating Devices

Illuminating Devices in the Great War—I, II. M. Brayton. Sci. Am. Supp., vol. 88, no. 2277, Aug. 23, 1919, pp. 114-115 and p. 127, 1 fig. Account of aerial lighting devices and their development from 1914 to the armistice.

Motor Transport Corps

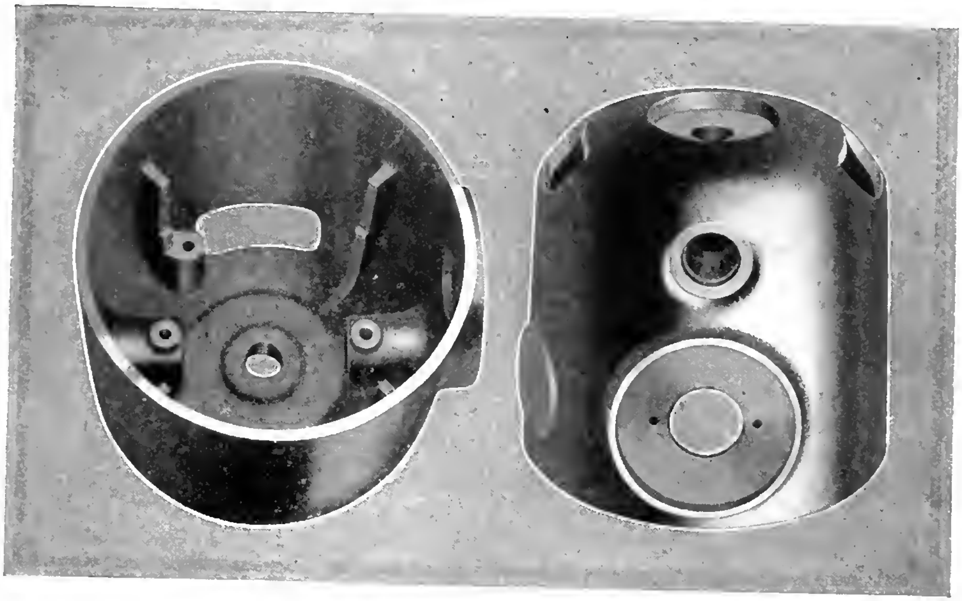
The Automotive Industry and the Motor Transport Corps, B. F. Miller. Jl. Soc. Automotive Engrs., vol. 5, no. 2, Aug. 1919, pp. 148-154. Concerning maintenance engineering features of Motor Transport Corps.

Naval Guns

Transportation and Mounting of Naval Guns at the Front (Trasporto e montamento dei cannoni navili alla fronte), Guiseppe Fioravanzo. Rivista Marittima, vol. 52, no. 6, June 30, 1919, pp. 293-305, 13 figs. Types of both mobile and fixed mountings developed by Italian army.

Navy, British

The New Navy—VII. Mar. Engr. & Naval Architect, vol. 42, no. 503, Aug. 1919, pp. 7-11, 4 figs. Details of "Courageous" and "Glorious



Die Casting Complicated Pieces

THE correct die casting of any complicated piece. such as the electric motor housing shown above, necessitates the skill and experience of the best engineers. Dies can be designed to do the work at the lowest cost, and to give the correct shape and finish to the castings. Teeth on small gears and pinions, threads, cored holes, webs, flanges and other parts of intricate castings will be absolutely accurate in shape with a clean, smooth finish if the dies are scientifically correct. Sometimes two or more pieces can be combined into one by the use of properly designed dies.

Stewart engineers have made the use of die casting possible for many manufacturers and have lowered the cost for others. No matter how complicated your parts may be, just send a sample or a blue print to us and get the report of the Stewart engineers on the possibilities of die casting for YOUR product.

Powder Gases

On the Possible Form of the Equation of State of Powder Gases, A. G. Webster. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 286-288. Examination of most general form possible for equation of state that will permit of variability of specific heats, but maintain constancy of their difference.

Pressure Measurement in Guns

A New Instrument for Measuring Pressure in a Gun, A. G. Webster and L. T. E. Thompson. Proc. Nat. Acad. Sciences, vol. 5, no. 7, July 1919, pp. 259-263, 4 figs. Apparatus which is said to register pressure at any time while projectile is in barrel.

Repair Shops

Portable Repair Shops for the Army, Harold S. Lord. Am. Mach., vol. 51, No. 7, Aug. 14, 1919, pp. 317-322, 6 figs. Including lists of tools and accessories carried by (1) machine shop, (2) blacksmith shop, and (3) carpenter shop, and also list of regular equipment for material truck.

Salvaging Submarines

A Salvaging Submarine, Hawthore Daniel. Sci. Am., vol. 121, no. 7, Aug. 16, 1919, pp. 154-155 & 166-168, 7 figs. Combination of surface vessel and diving bell, so arranged that whether diving bell is submerged or not, surface workmen can readily pass from surface vessel to bell and vice versa.

Shell Manufacture

Researches in regard to Various Points in the Manufacture of Shells (Researches sur différents points de la fabrication des obus), Léon Guillet. Revue de la Métallurgie, May 1917, 36 pp., 125 figs., partly on 34 supp. plates. Micrographic examinations and chemical analysis to determine influence of form of punch, rapidity of its wear, process of piercing, temperature of metal and of punch.

Submarine Defense

Science and Its Application to Marine Problems, J. C. McLennan. Shipbuilding & Shipping Rec., vol. 14, no. 5, July 31, 1919, pp. 123-124. Also Engineering, vol. 108, no. 2795, July 25, 1919, pp. 128-130. Development of antisubmarine measures and devices. Paper read before Northeast Coast Instn. Engrs. and Shipbuilders.

Torpedo-Boat Destroyers

Torpedo-Boat Destroyers in the Making, James Reed. Mech. Eng., vol. 41, no. 9, Sept. 1919, pp. 739-743, and p. 781. Historical review of modern American torpedo craft. Non-technical description of the "Ward," which was launched 64 per cent complete and only 17½ days after laying of keel.

General Science

CHEMISTRY

Acetylene Analysis

A Modified Method for the Analysis of Mixtures of Ethylene and Acetylene, William H. Ross and Harlan L. Trumbull. Jl. Am. Chem. Soc., vol. 41, no. 8, Aug. 1919, pp. 1180-1183, 3 figs. Gas holder used by writers applying method outlined by Chavastelon (see Compt. rend., 125, 245, 1897), for determination of acetylene in gaseous mixture.

Analysis

A New Method of Chemical Analysis, A. W. Hull. Jl. Am. Chem. Soc., vol. 41, no. 8, Aug. 1919, pp. 1168-1175, 9 figs. Method consists in reducing to powder form substance to be examined, placing it in small glass tube, sending beam of monochromatic X rays through it, and photographing the diffraction pattern produced.

Army Motor-Transport Vehicles

By JOHN YOUNGER,[1] PITTSBURGH, PA.

This paper contains a discussion of the types of vehicle best adapted to various military needs. Motor-transport vehicles have been classified by the Army under ten broad heads, ranging from the motorcycle to the 5-ton truck, and such a classification has been found to be a most satisfactory one. The ultimate ideal is of course to standardize a single type of vehicle for each class, and with that point in view the writer discusses the various vehicles used. Numerous photographs are presented as illustrative of American design and construction, and in the complete paper tables and curves will be found giving data on the various types used during the war.

IN considering the subject of motor-transport vehicles used by the U. S. Army the writer believes it is unnecessary to go into any detail regarding the history of motor-vehicle transportation in military use. It is of interest in passing, however, to note that steam vehicles were successfully used years ago, reaching their highest point of development in the British South African war. Motor road transportation does not come into great prominence again until the Great War of 1914, when its use exceeded the estimates of even the most radical. During the war motor vehicles were used by the tens of thousands. They paralleled the railroads, they crossed the railroads, they radiated in all directions. Motor trucks, loaded with shells in the Midlands, were driven straight to the channel ferry and run right up to the front line in France, without any changing of load, the saving in time being of course enormous. It is a matter of record that the fight for Verdun was fought and won largely through aid furnished by motor-vehicle equipment. The railroad was at the mercy of the enemy, and a military highway accommodating four streams of trucks was built, thus saving the city.

These are matters of history pointed out principally to illustrate a new mechanical feature which has arisen in warfare. The successful army, as of old, is in large measure the one which possesses the characteristic of great mobility. The internal-combustion-engine motor vehicle has in the past decade accomplished a revolution in military mobility and it is proper, therefore, that attention should be directed to the technical features underlying this great change. However, to go into detail concerning their mechanical points would be merely to recapitulate their catalog specifications. It is felt advisable, therefore, to try to form some measure of classification so that the whole broad array of motor equipment, ranging from the small motorcycle to the huge 5-ton cargo-carrying truck, can be studied intelligently and with a view to seeing in what direction we should plan in the future to take care of our military needs.

Fig. 1 Standard "B" Truck Fully Equipped for Cargo Purposes

Classification of Vehicles

Such a classification would be as follows below, and as the war progressed it was found more and more that this classification was a scientific one into which the various types of vehicles tended to concentrate, so that in the ultimate ideal there would be one standard-type vehicle in each classification. This particular point is one, however, which will be studied later.

1 Motorcycles
2 Light Passenger Cars, suitable for carrying five passengers
3 Heavy Passenger Cars (enclosed or limousine type) for carrying staff personnel
4 Ambulances
5 ¾-Ton Trucks, for carrying cargo or personnel
6 1½-Ton Trucks (either pneumatic or solid tires) for carrying cargo or personnel
7 3-5-Ton Trucks on solid tires
8 Trucks of the 4-wheel-drive type
9 Cargo-carrying track-laying type of vehicle
10 Trailers—¾-1½-3-5 or 10-ton.

Special Army Requirements

Before proceeding with a discussion in detail of each of the types in the foregoing classification, it would be well to consider whether the Army has or has not special requirements which render necessary the special design in their equipment. The inability of the motor vehicle to work economically on poor roads has called forth a general demand for improved highways which has resulted in the spending of millions of dollars on state highways this year alone. These state highways are chosen in location just as the railroad is—because of the economic purpose the road will serve, either in our commercial life or in our recreation. The very small minority that operate pleasure cars on poor roads have to pay the

[1] Asst. to Pres. Standard Steel Car Co., Pittsburgh, Pa. Mem.Am.Soc.M.E.

For presentation at the Annual Meeting, New York, December 1919, of The American Society of Mechanical Engineers. The paper is here printed in abstract form and advance copies of the complete paper may be obtained gratis upon application. All papers are subject to revision.

penalty, and even more so with motor trucks. A great volume of business lies in the cities where exceptionally good roads are met, whereas the number of trucks operating outside of the cities is very small.

The problem of the Army, however, is different, for rarely, if ever, does it operate in a big city, its operations being confined to the open country. It has to take roads as it finds them and sometimes it has even to make its own roads. In this connection it is of interest to examine the roads on the borderlands between this country and Mexico and to observe that they actually barely exist. The needs of the Army must therefore be considered from the military standpoint and neither political nor commercial considerations should be allowed to block the main issue, namely, that the Army must have proper motor transportation suitable to insure its mobility under any possible circumstances in which it will be called to fight. Stress is laid on this point as there have been arguments pro and con as to the advisability of the army using commercial vehicles. The war in France brought little light on this subject because for years the battle line was practically stationary

Fig. 2 Ordnance Design of 4-Wheel-Drive "Tractor-Truck"

and the country behind the lines had innumerable highways of high-grade construction of an antiquity reaching back way beyond the days of Napoleon—actually to the days of Julius Cæsar. The motor vehicle, therefore, for military use should be considered from the military aspect and we should not necessarily try to foist on the Army vehicles which are of proven value only in the commercial field.

Discussion of Types

Motorcycles. These proved of tremendous use in warfare. Where despatches had to be carried over exceedingly rough ground, where high speed was essential, where transportation under fire was necessary, the motorcycle proved its value. Two of the commercial makes of motorcycles manufactured in this country proved that in general they were satisfactory from a military standpoint. Military use, it is true, developed certain weaknesses which were ultimately remedied, but the experience of the war indicated that the present-day motorcycle of standard construction suitable for side-car use would survive as a standard of equipment, and that a light-weight machine—not over 250 lb. in weight—should be developed for "solo" work.

Light Passenger Cars. Two American machines were used in great quantities, the Ford and the Dodge. Both gave good satisfaction, but it is felt that still better satisfaction could be obtained by concentration on one passenger machine of a somewhat more rugged design. There are, however, commercial aspects in this case as machines such as the above have a tremendous market off the beaten highway and their economic and satisfactory use by farmers and the like over poor roads, or over no roads at all, furnishes sufficient test to warrant the army considering very seriously in this case the commercial vehicle. On the whole, it was found that the car of the Dodge type gave the most satisfactory results. This type of vehicle was used for officers in their work involving the covering of territory, in the transportation of light supplies, as an emergency repair wagon, and in all kinds of ways which will suggest themselves to any student of military affairs. It is the writer's personal opinion that there is no necessity for two types of cars—one type alone will be ample. Only in cases of sudden emergency, where a tremendous increase in the army would be required, would it be advisable to increase the number of types.

Heavy Passenger Cars. For staff use it is essential that a more powerful car, capable of maintaining a high speed over long distances, should be provided. This car should be preferably of the sedan or limousine type to insure comfort to the occupant. The staff officer in directing troop movements is often required to make long journeys at night in such a car, and all facilities should be provided to insure rest. This car should be provided with facilities for carrying maps, reports, etc., and with necessary lights so that such could be studied during the night. This car will only have a limited use and will be used almost exclusively along the highways, so that a commercial type of car would be quite suitable. During the war the Cadillac was used exclusively for this purpose by the American Army and its specifications would stand today as being typical of what would be required for future use.

Ambulances. The ambulance is a peculiar type of vehicle in the sense that while its load consists of only four or five passengers, the shape of the load (the patients, of course, being recumbent) necessitates almost a box-van construction for the body. Furthermore the fact that the patients have to be carried with great care necessitates special attention being paid to the springing and the comfort generally of these vehicles, particularly when it is realized that they must operate as closely as possible to the firing line and in all probability some distance away from the good roads, and subject to shell fire. The writer feels that for this purpose the chassis used for passenger carrying is one which will be found most desirable for this use, with a possible change in the direction of lengthening the wheelbase to insure better adaptation to the body.

During the war there were two types of ambulances used, one a simple 4-patient ambulance mounted on a long-wheelbase Ford chassis; the other, a more elaborate one mounted on the ¾-ton G.M.C. truck. Both ambulances had their distinct use, the Ford type being used close to the firing line, while the G.M.C. was used more behind the lines from the rest stations to the base hospitals. In view, however, of the limitation in number of our standing army, it is believed in the interest of concentration of equipment that it would be advisable to have only the one chassis used for this purpose. It is felt unnecessary to go into the details of this chassis.

Passenger-Carrying Heavy Vehicles. The passenger-carrying heavy vehicle calls for special mention as it differs from the cargo-carrying type. In connection with artillery work it is necessary to carry a band of men for special work. Reconnaissance also calls for a crew of men to go out with range finders, various binoculars, instruments and tools for marking so that a proper site can be selected for the placement of field guns. The vehicle for this purpose must be provided not only with seats carrying the necessary personnel, but also with proper compartments for carrying the various tools required. The vehicle for this purpose should be capable of traveling over rough ground and should be, as are the others, of sturdy construction. Another type of passenger-carrying vehicle is what is usually known as a staff observation car. This is a large car — sometimes of the omnibus type — in which as many as nine or more passengers can comfortably be carried. This is used on occasions when the staff, particularly in the artillery, wishes to make an observation run or for the purpose of visiting

different posts. The 1½-ton cargo-carrying chassis with pneumatic tires is quite suitable for this work.

The ¼- and 1½-Ton Pneumatic Tire Trucks. The ¼- and 1½-ton pneumatic-tire trucks can be grouped together as their work is very similar. A high state of development was found in these capacities of commercial trucks from the Army standpoint, this being most certainly a result of the fact that both these capacities are used in large numbers in country districts where bridges and other limitations do not interfere with their use. These vehicles are used for carrying modern loads, the smaller size being used for emergency repair work, carrying emergency stores, and for final distribution of supplies from the main dump or from one or other of the advanced stations. They are also used in large numbers in connection with the Air Service, furnishing supplies of all kinds not only for the airplanes but for the personnel. Airplanes, of course, had their stations off the road in the fields, and naturally the lighter trucks were found necessary.

Special attention is called to the use of pneumatic tires. It was found in trucks up to 1½-tons capacity that pneumatic tires allowed running on very poor roads and over comparatively soft surfaces, such as a grass field, under conditions that would have prohibited the use of solid tires. It was also found that high speeds could be maintained for long periods with practically no damage to the vehicle. For example, a 1½-ton capacity cargo truck could be driven at a speed of 30 m.p.h. over give-and-take roads for long periods. This, of course, has a tremendous value in mobility and also in emergency cases where supplies can be rushed forward. Under certain conditions, such as operating over sandy roads (as are found in many parts of the country), these moderate-capacity trucks with large pneumatic tires would be practically the only trucks that would be of any value.

Much discussion has ranged over the use of pneumatic tires, whether they should be single or dual on the rear. European practice has been to use dual tires on the rear, the front and rear size being the same, thus eliminating the necessity of carrying two spare tires and tending toward interchangeability. American practice has been to use one size of tire on the front, such as for example, 38 in. by 7 in. and a larger (40 in. by 8 in.) single tire on the rear. Both types have worked out successfully during the war and it is felt that a little longer period of development is necessary before a decision could be arrived at as to which is likely to be the surviving type, if not both.

FIG. 3 EXPERIMENTAL TYPE OF TRACK-LAYING AMBULANCE USING THE FORD CHASSIS

The 1½-Ton Solid-Tire Trucks. The 1½-ton cargo-carrying truck with solid tires can be looked upon in the Army as the maid-of-all-work. Cargo of all kinds, men, supplies, food, and munitions are carried on this steady-going vehicle. This is the vehicle which has in motorized equipment taken the place of the standard mule escort in the old Quartermaster Department. Able to run at 16 m.p.h., of sufficiently light weight that it can go over any average bridge, thoroughly worked out over a period of years in commercial life, in the Army found but little change necessary in adapting it for their purposes. In the selection of one type for standardization it was found very difficult to distinguish which among a number was the best, and it is no slur on any of the types not approved when, for various reasons not always connected with their technical worth, they were rejected.

The 3-5-Ton Cargo-Carrying Trucks. The 3-5-ton truck was not used during the Mexican War and it remained for the Great War to establish its status as one of the standard vehicles of the Army. It was around this capacity of truck that tremendous discussion raged during the early stages of the war. The Army, in considering the various heavy capacity trucks on the market, came to the conclusion that these were unsuitable for military use. The

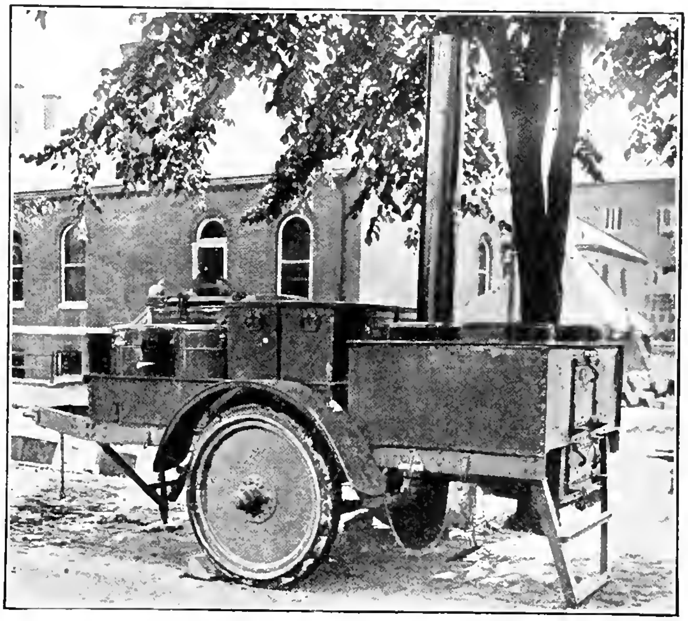

FIG. 4 ARMY ROLLING KITCHEN READY FOR MOVING

5-ton truck of commerce is used almost solely around the cities. Bridge and load limitations have been, of course, partially preventive of its use in outlying districts, but the big obstacle has been the fact that the industry requiring a truck of this capacity is almost invariably located in the larger cities and requires this purely for city use. The commercial vehicle of this capacity has therefore been developed, consciously or unconsciously, along good-road conditions. It was found that, in operation over poor roads, it had insufficient ability to proceed at a regular speed through heavy mud holes or heavy winter conditions. This point will of course be argued by those responsible for the average heavy-capacity truck, and while it is true that such trucks could operate under such conditions, the penalty paid was nevertheless tremendous.

For this reason, the Government saw fit, in 1917, to design and develop a truck of its own, this being known variously as the "Liberty" truck or "B" Type truck, the latter being its official title. Fig. 1 shows this truck fully equipped for carrying cargo. It was developed by the coöperative efforts of the engineers of the industry and the Government and was put into production, approximately 18,000 being manufactured to meet the demands. In this vehicle the special points that were required by the military use were built into the truck and were not added as an afterthought. The ability of this truck (piston displacement per 1000 lb. moved 1 ft.; or the torque at the rear wheels' circumference) is approximately 50 per cent greater than that of similar capacity in commercial trucks. This is more noticeable on the low or first-gear drive. In driving around on the various trucks, watching their performance under heavy conditions, one could not but be impressed with the ease with which this truck operated over extremely heavy going.

This capacity of truck was developed as a larger brother to the

$1\frac{1}{2}$-ton truck. Its military advantages were not at first seen but later they became obvious. Its overall length was less than 10 per cent greater than that of the $1\frac{1}{2}$-ton truck and similarly with its width. Carrying two or three times as much cargo as the smaller truck, it offered virtually the same target on the road and in convoy work was almost 66 per cent less in length. From the standpoint of what might be called the direct labor problem of the Army, the number of men required to operate the heavy truck was exactly the same as that for the lighter truck; thus, for given amount of cargo it released more men for the firing line. The work of repairing, the number of spare parts necessary, maintenance and cost of running were also almost identical with those of the lighter truck and it is not surprising, therefore, to find that although this class of truck was introduced in the Army at a late date, it made tremendous strides, outnumbering any other capacity of truck. Another advantage that showed itself, due to capacity and ability to put on large platforms, was that this vehicle offered means of using trucks for all kinds of work where mobility was essential.

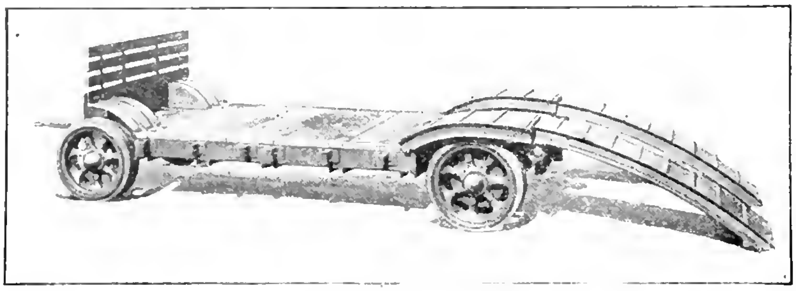

FIG. 5 ARTILLERY 10-TON TRAILER FOR TRANSPORTING TRACK-LAYING TRACTORS, SMALL TANKS OR GUNS

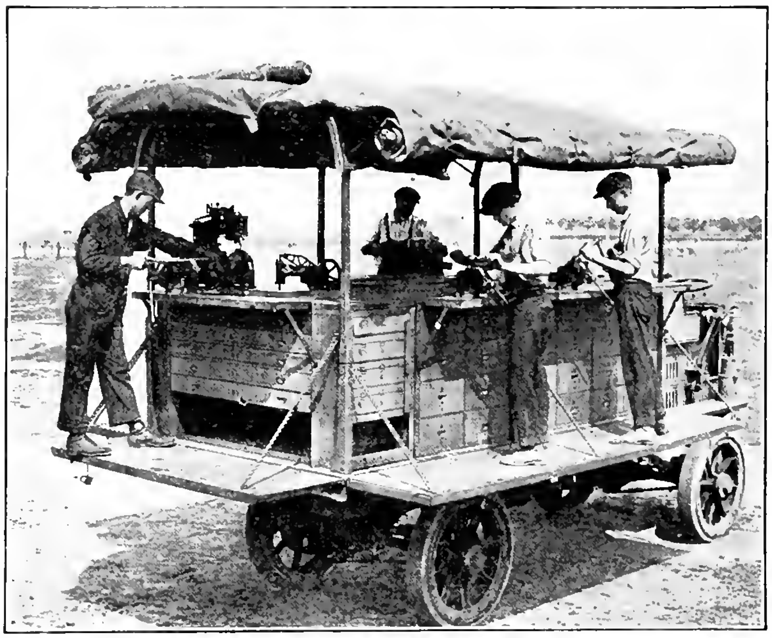

FIG. 6 ORDNANCE MOBILE REPAIR SHOP

It is felt that this "B" type truck will be the standard heavy cargo-carrying truck for the Army. It will undergo normal developments with time, and, in peace conditions, prove itself of tremendous value in military operations. During war times, if there be any kind of highway system, it will also demonstrate its value. It is also believed that, with the proper organization and with the proper help from the Engineer Corps in improving the existing highways and bridges, it will be able to operate almost anywhere that the army operates.

The 4-Wheel-Drive-Type Truck. The 4-wheel-drive truck shown in Fig. 2 is that type of vehicle in which the driving power is conveyed to all the four wheels and in which the full weight of the truck is available for traction purposes. Sometimes this type of truck steers on all four wheels, and sometimes only on the two front ones. Almost invariably, however, there is some type of differential locking or partial locking device which insures power being delivered to each wheel, whether or not that wheel is on a slippery or hard surface.

This type of truck is also subject to great argument; either its users are very strongly for it or they are very much against it — there seems to be very little middle ground in the discussion. On analysis, the reason for this shows itself. In military work and in emergencies it is essential that certain supplies be carried from one point to another, no matter what the terrain may be like. Sometimes the conditions are so bad that men must carry the supplies themselves or by mules; sometimes the conditions, while severe and absolutely prohibitive of the use of the ordinary vehicle, will yet allow the use of the 4-wheel-drive truck. With driving chains on all four wheels and with an extremely low-gear reduction, every ounce of power is available for traction and the 4-wheel-drive truck accomplishes its mission. Feats like these of regular daily occurrence in the Army have made military people, particularly in the Ordnance Department and Artillery Corps whose work is mostly "off-road," staunch adherents of the 4-wheel-drive truck. It must be realized, however, that during this work the strain on the truck is enormous. Only the heaviest jobs are given to this type of vehicle and under these severe conditions, it is not difficult to understand that the maintenance problem is tremendous. It is from this last viewpoint, in comparison with the 2-wheel-drive vehicles, that the 4-wheel-drive type has suffered, and suffered, it must be said, unfairly. Over good or reasonably good roads there is no necessity for a 4-wheel-drive type of truck, but over almost impassible roads the 4-wheel-drive truck will justify its existence. In the service of the Marine Corps, for example, where weight limitations are necessary and where the ability to go anywhere is essential, the $1\frac{1}{2}$-2-ton capacity 4-wheel-drive truck is standard. It should also be noted that the 4-wheel-drive type of truck proved its value as a tractor for hauling guns over roads where the track-laying type of vehicle was almost prohibited. In hauling trailers and in the general haulage work required, this 4-wheel-drive type of vehicle became a necessary part of the equipment.

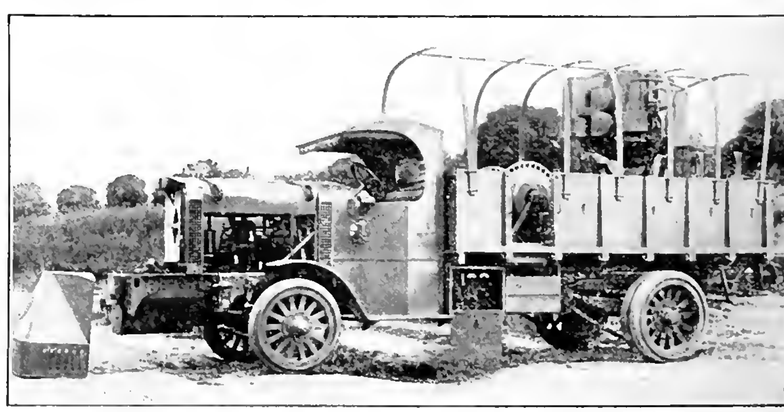

FIG. 7 SEARCHLIGHT EQUIPMENT USED BY ENGINEERS CORPS, MOUNTED ON SPECIAL 6-TON CHASSIS

Track-Laying Cargo-Carrying Trucks. First of all, this type was developed for agricultural-tractor purposes, the idea then being seized upon and used by the British in the design of their tank. It was natural that the caterpillar of track-laying type of vehicle should eventually be discussed in its relation to carrying cargo over "off-road" conditions. As practically all production capacity was used in the manufacture of tanks and what spare capacity there

was, was used for agricultural tractors it was almost impossible to develop the cargo-carrying track-laying type of vehicle during the war, but all indications pointed to the necessity for considering this design very seriously for the future in order to still further attain the ideal of perfect mobility. Small progress was made however, but still enough to show that the attention of military designers should be directed largely to this type. For winter conditions, for example, this may be found necessary; and for shell-torn fields, otherwise impossible to traverse, a track-laying vehicle may give the solution of the problem of transportation. One drawback to its use at present is the fact that over hard roads the wear and tear on the vehicle is greatly exaggerated and the maintenance problem is very severe. There is no question, however, but that these mechanical problems will be solved in time. An interesting application of the track-laying type of vehicle is shown in Fig. 3.

Trailers. These vehicles, strictly speaking, are not automotive vehicles, but their use is so linked with the others that it is necessary to consider them all together. Broadly their capacities fall under the same headings as do the cargo-carrying trucks, but experience has demonstrated the necessity for a much heavier type of trailer of the capacity of 10 tons. Apart from the commercial use of trailers they were first used by the Army as a means of getting around the shortage of engine-transmission and motive-axle production, in other words, to furnish some means of transportation. It was later found that apart from this, they were of great value.

Their use is indicated where extreme mobility is not required, as certain functions of the Army can be carried out, not on the firing line, but at a more or less permanent base. For example, advance repair shops need not be as mobile as the fighting army, but rather sufficiently immobile so as to allow the work being done. There should be, however, sufficient mobility to allow of eventually catching up with the advance forces. Such equipment as small repair shops, camp kitchens (see Fig. 4), partially mobile offices, X-ray surgical laboratories, cranes, etc., can also be conveniently mounted on trailers.

Other uses of trailers are indicated where for special reasons the truck or tractor is insufficient; for example, a field gun mounted on its own wheels is not able to traverse mile after mile of hard road at high speed. It is, therefore, advisable to draw this gun on the trailer platform such as shown in Fig. 5 and tow it behind the truck. Similarly, tanks and caterpillar tractors were prohibited from traveling along the French roads, due to the damage they were said to create, and furthermore it was found advisable, on account of their slow speed, to have them proceed at a much faster pace. They were, therefore, also driven under their own power on to the platform of a trailer and towed along the roads at a comparatively high speed. In addition to the foregoing there is also a certain use in connection with ordinary cargo-carrying trucks, where a small number of trailers have been found advantageous in helping out the trucks in the carrying of supplies.

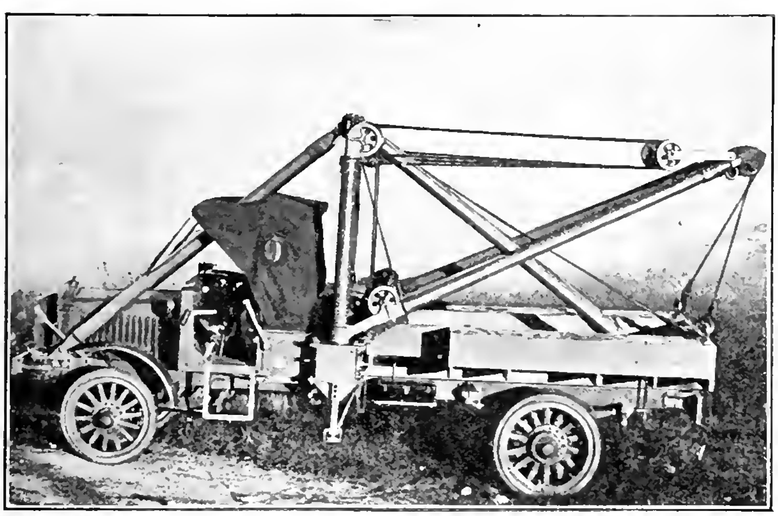

FIG. 8 A SPECIAL TYPE OF WRECKING APPARATUS MOUNTED ON A "B" TRUCK

It is believed that standardization of trailers for military use will have to proceed along somewhat different lines than the standardization of trucks. The trailer is especially for emergency uses and all kinds of special work, whereas the platform will vary with the requirements. There is no reason, however, to prevent the standardization of the running gear, such as, for example, the structural framework, the axles, springs, wheels, etc., and the draft gear for towing.

There will undoubtedly be discussion as to whether 2-wheel-drive trailer or 4-wheel-drive type trailer will be advisable. The solution of this is again limited by lack of experience and information which will have to be digested, analyzed and the result derived therefrom. It would appear as if the 2-wheel type of trailer will be of value in the smaller size and the 4-wheel type in the larger size from 2 tons upward.

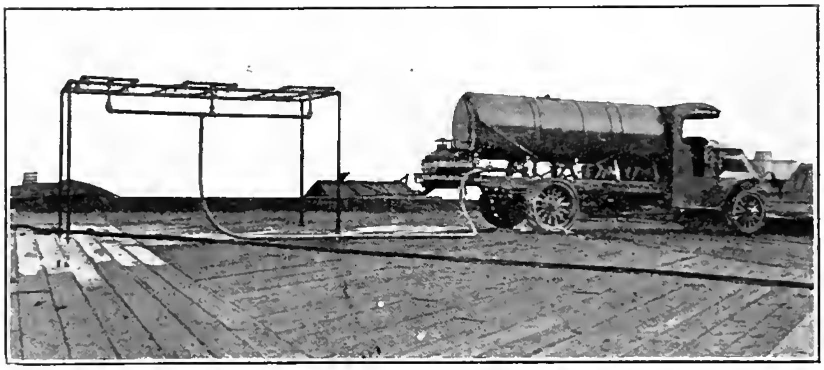

FIG. 9 MOBILE SHOWER BATH, DEGASSING OR DELOUSING OUTFIT

SPECIAL TYPES

In the military use of motor vehicles, first of all for cargo purposes it became obvious to inventive minds that here was not only an idea which would enable functions previously carried out in a slow way to be speeded up, but an idea which would establish new function. Special vehicles were asked for and were produced; mobile repair shop (see Fig. 6), vehicles carrying searchlights driven from the engine of the truck as generator, searchlights carried on the platform of the truck operated from their own engines (see Fig. 7), chemical laboratories, vehicles for the special purification of the water supply, photographic laboratories, lithographic laboratories, vehicles in which the power of the engine was geared to a large winch for the maneuvering of large observation balloons or to a crane thus creating a wrecking car (see Fig. 8), vehicles with integral wireless apparatus, with X-ray apparatus, with special tanks and pumping equipment and heating equipment for degassing and delousing soldiers, disinfecting vehicles, laundry vehicles, etc. Where action was necessary these thoroughly mobile vehicles could be brought forward at once.

An interesting case is that of the "degassing outfit," shown in Fig. 9. It was found that the effects of mustard gas could be greatly minimized, if not altogether prevented, by treating those exposed to a heavy shower of warm water shortly after contact. The soldier would be stripped, given a hot shower, under pressure, for about fifteen seconds, then sprayed with liquid soap, then lathered, then washed off; the whole operation taking about one minute. He would then receive new disinfected and deloused clothing and a new gas mask and be fit for immediate service again. A large tank

Scientific Development of the Steam Locomotive

By JOHN E. MUHLFELD,[1] NEW YORK, N. Y.

Despite the fact that marked progress has been made in the development of the steam locomotive, there still remains considerable opportunity for further improvement, and the general lines along which such improvement should be made form the supporting data of the following paper. The author first briefly outlines the factors involved in the determination of the tractive power of a locomotive. He next discusses such items as boiler feedwater, types of fuel, combustion, heat distribution, steam pressures, superheating, and steam generation and utilization. The acceleration and deceleration of a locomotive are also considered, and the paper is concluded with a discussion of the methods of saving fuel and labor, both of which should produce a higher standard of operation and economy.

STEAM railroads, to be successful, must, through executive foresight and engineering progressiveness, respect the same law of additions and betterments that applies to other profitable industries and which demands continuous modernization of plant and equipment in order to effectively and economically meet the necessity for greater production and speed by means and methods that will result in the least possible artificial age being capitalized in the improvements when installed.

Marked progress has been made in the development of the steam locomotive as the result of superior engineering ability, and the results have in many respects been exceedingly effective. This progress, however, has been confined largely to an increase in size, weight, evaporation capacity and hauling power, and while the general use of superheaters and firebox baffle walls during the past ten years has substantially assisted in improving sustained boiler capacity and increasing thermal efficiency as well as in keeping the steam locomotive in advance of the electric locomotive, the opportunity for further improvement in thermal and machine efficiency and to reduce smoke, cinders, gases and noise is untold.

The desiderata in a steam locomotive may be summed up as: a reasonable first cost; maximum capacity for the service within roadway weight, curvature and clearance requirements; ability to handle the heaviest gross tonnage practicable at the highest permissible speed; positive control of mechanical operation; economy as regards fuel and water consumption and repairs; minimum manual labor for road and terminal handling; construction of the least number of parts, and capacity to perform continuous mileage without failure.

Modern types of steam locomotives fulfill quite satisfactorily all of these requirements with the exception of wastefulness in fuel, water and steam consumption as may be gathered from the fact that the thermal efficiencies now obtained are only from 50 to 65 per cent at the boiler, from 60 to 75 per cent for combined boiler and superheater, and from 4 to 6 per cent at the drawbar. These as compared with thermal efficiencies of from 3 to 5 per cent at the drawbar of an electric locomotive, 18 to 19 per cent at the switchboard of a modern steam-electric central power station, 25 to 30 per cent for internal combustion engines, and 40 to 45 per cent as claimed for the full range of from one-quarter to full load for combination internal-combustion and steam motors.

The increase in the first cost and in the cost for labor, fuel, material and supplies for operation and maintenance of the steam locomotive has been most marked during the past ten years, particularly since the war. It is now being operated and maintained by highly paid enginemen and mechanics, with high-priced materials and supplies, and the machine and its performance must be brought up to a more respectable basis of engineering efficiency if it is to be perpetuated.

The supporting data of this paper, which apply to the United States, present the reasons why the general improvement of the steam locomotive should embrace the following changes which, it may be opportune to here state, are now being embodied in the design, specification and construction of a new type of locomotive, the first of which it is planned to have in regular service in 1920 on a prominent and progressive Eastern railroad:

a Steam at a pressure of about 350 lb. to be employed, superheated to about 300 deg. fahr.
b Improved boiler, furnace and front-end design and appliances
c Greater percentage of adhesive to total weight, and a lower factor of adhesion
d More efficient methods of combustion
e Use of exhaust-steam heater and flue-gas economizer for boiler feedwater
f Better steam distribution and utilization
g Reduced cylinder clearances and back pressure
h Lighter and properly balanced reciprocating and revolving parts
i Lower heat, frictional and wind-resistance losses
j Improved safety and time-, fuel- and labor-saving devices

[At this point in the complete paper the author gives brief particulars regarding the existing steam-locomotive stock under the control of the United States Railroad Administration, following which he quotes an opinion reported to have been expressed by Director General William G. McAdoo, to the effect that the great unused water power in the western part of this country should be developed for national electrification of the railroads; and after discussing at length the reasons for the perpetuation of the steam locomotive, he points out why national electrification is neither practical nor desirable. After enumerating the factors governing the design and specification for a new steam locomotive, he then takes up the problems involved in its scientific development, and extended extracts from this section of the paper immediately follow.—Editor.]

Design, Material and Workmanship

In this country the steam locomotive has not been classified as a refined piece of engineering mechanism, such as a marine or stationary steam engine, due primarily to the indifferent conditions under which it has had to be operated and maintained and the relatively low cost for its fuel and supplies. However, with existing public demands for greater safety, speed, comfort, efficiency and economy in the movement of traffic, only by greater refinement in construction can requisite operating results be produced to offset the increased cost of equipment, supplies and labor.

Therefore the designing should now be done along more scientific lines through the substitution of boiler, cylinder and drawbar horsepower and drawbar-pull calculations for tractive power; thermal efficiency for evaporation results; distributed for centralized thrusts, strains and stresses; light high-grade alloy and high-carbon steels and other metals for heavy low-grade plates, forgings and castings; and in the more general use of high-grade engineering practice in lieu of rule-of-thumb methods.

Adhesive Weight, Tractive Power and Factor of Adhesion

Adhesive Weight. The extended use of non-productive trailing wheels and the four-wheel leading truck has become an expensive fashion in that it has greatly reduced the percentage of total engine weight on drivers for adhesive purposes.

Boiler design and weight distribution should be so correlated to the running gear as to make the use of trailer wheels unneces-

[1] Railway and Industrial Engineers, Inc. Mem.Am.Soc.M.E.

For presentation at the Annual Meeting, New York, December 1919, of The American Society of Mechanical Engineers. The paper is here printed in abstract form and advance copies of the complete paper may be obtained gratis upon application. All papers are subject to revision.

sary, except where required by wheel-load limitations, and with the more recent improvement in constant resistance leading truck designs any four-wheel arrangement, except for high-speed passenger service, should be entirely satisfactory.

Tractive Power. In calculating tractive power the usual practice is to use 85 per cent of the indicated boiler pressure in lb. per sq. in. for two- and three-cylinder single-expansion, and 52 per cent for two- and four-cylinder compound engines. However, for a superheated-steam locomotive the use of a higher percentage of the indicated boiler pressure should receive due consideration when making tonnage-rating schedules before the train load is finally determined upon, as dynamometer tests have indicated that as high as 92 per cent for two-cylinder single-expansion locomotives is permissible for train-loading purposes.

Factor of Adhesion. The coefficient of static friction or adhesion between driving wheel tires and very dry, clean rails reaches a maximum of about 0.35, and for moist, muddy, greasy and frosty rails a minimum of from 0.15 to 0.20, giving factors ranging from 2.85 to 6.65.

In general, the factor of adhesion should be as low as practicable, in order that the maximum power will always be available to start trains that can be easily handled when in motion, and should about equal the ratio between the limiting friction in pounds and the weight on driving wheels in pounds, which, for average dry rail is from 3.5 to 4.

Tracking, Curving and Riding

With the increased length, higher center of gravity, extended front and back overhang and smaller proportion of spring-borne weight there have been many difficulties to overcome in order to maintain proper tracking, curving and riding qualities in locomotives of great power, and in the majority of cases these have been met with unusually satisfactory results.

As the reciprocating forces must be neutralized by means of a revolving body, which cannot produce a perfect balance, it is of the greatest importance that every allowable effort be made to reduce the weights of pistons, crossheads and main rods and divide all weights as uniformly as practicable over all driving wheels, in order that excess balance may be reduced to the minimum and the greatest possible static weight permitted on the driving wheels.

Boiler Feedwater

No item in the operation and maintenance of steam locomotives contributes to greater unnecessary cost than boiler feedwater containing excessive incrusting, corrosive and foaming elements.

Observations and experiments indicate that any scale porous to water has little effect on boiler economy. However, such scale when dried out or hardened next to the metal by the expulsion of the carbonic acid, as usually occurs when boilers are forced, will not only become an excellent heat insulator and cause a heat loss of about 10 per cent when 1/8 in. thick, but it exposes the sheets and staybolts to overheating and "mud burning," with resulting leakage and shopping for repairs and cleaning.

In view of the increasing size of locomotive boilers and the high ratings to which they are subjected, the importance of purifying unsuitable water to prevent incrustation, corrosion, leakage and burning, as well as to eliminate delays and cost for cleaning, repairing and extra fuel consumed, cannot be overestimated, and until the many existing conditions of this kind are corrected, neither the existing nor improved steam locomotives can be expected to render satisfactory and economical service.

Boiler-Feedwater Purifying

When an adequate and suitable supply of boiler feedwater cannot be obtained from the usual sources, then the proper treatment of the available unsuitable water becomes necessary by settling; filtration; chemical treatment in treating plants, supply tanks or tenders; or, in the case of suspended matter and carbonates, by partial purification in a combination open and closed type of exhaust-steam feedwater heater on the locomotive.

Fuel

The principal fuels now used in steam locomotives are the commercial grades of bituminous and anthracite coal and fuel oil. While millions of tons of the by-products of anthracite and bituminous coal mining are available, as yet practically no progress has been made in their utilization, although satisfactory means and methods are now developed. This applies as well as to the enormous deposits of sub-bituminous coal and lignite that are only awaiting mining operations to come into their effective and economical use as locomotive fuel.

Regardless of the kind of fuel now used by steam locomotives, more general attention is being given to its proper preparation for the class of service to be performed and the method of firing to be followed, before it is supplied to tenders. However, the factors of kind and size of coal and method of firing must each be carefully considered and coördinated in order to insure the best results as may be shown by Table 1, which gives comparative performances of a stoker-fired modern Mikado type of locomotive with superheater and firebrick baffle wall supported on water circulating tubes.

TABLE 1 COMPARATIVE TESTS OF A STOKER-FIRED MIKADO-TYPE LOCOMOTIVE USING DIFFERENT SIZES AND KINDS OF COAL

Item	Test No.	1	2	3	4
1	Coal, kind	Bituminous	Bituminous	Bituminous	Bituminous
2	Coal, class	Gas	Gas	Soft	Soft
3	Coal, grade	Nut, pea and slack	Slack	Run-of-mine	Screenings
4	Coal, moisture, per cent	1.23	1.57	0.75	0.81
5	Coal, volatile, per cent	36.47	35.74	18.17	17.52
6	Coal, fixed carbon, per cent	53.94	52.78	69.07	70.06
7	Coal, ash, per cent	8.36	9.91	12.01	11.61
8	Coal, sulphur, per cent	2.59	3.30	3.33	2.31
9	Coal, B.t.u. (calorimeter)	13,910	13,790	13,880	13,970
10	Total miles run	505	505	505	505
11	Kind of firing	Stoker	Stoker	Stoker	Stoker
12	Pounds of coal per average drawbar hp-hr.	3.74	4.19	4.14	4.89
13	Boiler efficiency, per cent	46.60	41.90	46.10	38.00
14	Relative pounds of coal fired, per cent	100	111.87	110.54	130.56
15	Relative cost of coal, per cent	100	102.14	123.58	143.64

It will be noted from Table 1 that while the heat value (Item 9) of each of the four fuels tested was practically the same, there is a difference of over 30 per cent in the quantity fired, and of over 43 per cent in the fuel cost for the same work done, when comparing the poorest with the best performance, and that the use of either grade of soft coal is absolutely prohibitive so long as either grade of gas coal can be obtained.

With the cost for locomotive fuel on tenders practically doubled during the past two years, and next to labor the largest single item of railway operating expense, the best methods for its use will now begin to receive the consideration that this large item of operating cost justifies.

Combustion

A comparison of the figures of 65 years ago with the average saturated-steam-locomotive performance of today will show little improvement has been made in the average road service.

The locomotive fuel bill for the year 1918 was approximately $750,000,000, and while full recognition is given to the fact that from 25 to 50 per cent of the available energy in the fuel is still needlessly wasted, and that present methods of mechanically firing, as compared with the average hand firing, and burning coal on grates or in retorts increase this waste, but little has been accomplished in regulating combustion so that this loss may be reduced.

The combustion rate generally follows the increase in draft until about 100 lb. of bituminous and about 50 lb. of anthracite coal are burned per square foot of grate area. After this the additional coal supplied is not effectively consumed, due to the difficulty in supplying sufficient air, equally distributed, through the grates and fuel bed to oxidize the fixed carbon and volatile matter in process of combustion without a large excess of air, such as obtains when forcing takes place, and it becomes necessary to open the fire door so that combustion can be completed by the admission of air above the fuel bed.

The greatest loss in heat is that due to the heat carried off in the stack gases, sparks and cinders, which usually results in a smokebox temperature of from 560 to 750 deg. fahr. for the best practice. Adding to this the heat losses due to combustible in ash, vapors of combustion, carbon monoxide and otherwise, leaves an average of from 25 to 40 per cent of the heat in the fuel as fired unabsorbed by the boiler and superheater.

With the best hand firing, when using dry bituminous coal averaging 14,100 B.t.u. and 60 per cent fixed carbon, 32 per cent volatile and 8 per cent ash, the fuel rates in Table 2 will usually obtain:

TABLE 2 CONSUMPTION OF DRY BITUMINOUS COAL BY LOCOMOTIVE WITH BEST HAND FIRING

Total indicated horsepower of locomotive	Dry coal per i.hp-hr.
500	2.8
750	2.7
1,000	2.6
1,250	2.5
1,500	2.6
1,750	2.8
2,000	3.0
2,250	3.2
2,500	3.4

As compared with hand firing, stoker firing will result in an increase of from 10 to 25 per cent in the fuel fired, while if the same coal be pulverized and burned in suspension there will be a decrease of from 15 to 25 per cent in the amount of fuel fired.

As the locomotive firebox, which in the best practice represents only from 7 to 10 per cent of the total boiler evaporating surface, must generate all and absorb from 30 to 40 per cent of the heat energy that is converted into drawbar horsepower, the fuel effectively consumed, not fired, is the measure of work done. Therefore the largest permissible combination of firebox and combustion-chamber volume, heating surface and grate area should be provided and equipped with an arrangement of firebrick baffle walls placed on water-circulating supports in a manner to produce long flame travel, high firebox temperature and the maximum radiant heat for absorption by the surrounding water.

With the usual limitations in firebox volume, too much importance cannot be placed on the arrangement of heat-absorbing and radiating walls for the purpose of flame and radiant-heat propagation. Carefully conducted tests have shown that the best results are obtained from solid firebrick baffle walls, and that the unburned gas, coal-dust, spark, cinder and smoke losses are reduced with an increase in their length and gas-passage arrangement.

The greatest difficulty in controlling combustion occurs at high horsepowers and long cut-offs, and where grates are used, and for the best results the air openings should be equal to about 50 per cent and those in the ashpans to about 15 per cent of the total grate area, so that firebox temperatures of from 2000 to 2500 deg. fahr. can be obtained and the unburned solid fuel, carbon monoxide and excess air over the fuel bed reduced to a minimum.

As with dry pulverized coal of 12,130 B.t.u. value, an average boiler efficiency of 69.2 per cent at 1080 boiler hp., and an average combined boiler and superheater efficiency of 78.1 per cent at 1220 boiler hp., with an equivalent evaporation averaging 42,100 lb. of water per hour from and at 212 deg. fahr., has already been obtained on a Mikado simple-cylinder type of locomotive hauling fast freight trains over a 113-mile division, the possibilities for reducing the steam-locomotive fuel consumption are practically unlimited, and much remains to be done in this direction by good hand firing, through a combination of the fireman's eyes, brain and brawn, provided the thermal efficiency of the modern locomotive at the drawbar is brought up to where it can and should be.

Boiler-Water Circulation

In designing a boiler it is extremely desirable to secure the most rapid circulation practicable, as with high combustion rates and temperatures and the abnormal state and behavior of the water film in contact with the heating surfaces, the load on the firebox sheets is very intense, the conduction rate averaging from 75,000 to 100,000 B.t.u. per sq. ft. of evaporating surface per hour.

Therefore, in order to avoid resistance to heat transfer, with resultant overheating of metal and reduced efficiency, a relatively high velocity of circulation and at least a rate of 125 ft. per min. in the most sluggish locality is very essential.

The average locomotive boiler does not present ideal water-circulation possibilities, but the enlarging of contracted spaces, increasing of water-leg, flue and tube clearances, and provision of suitable outlets from choked water pockets will not only reduce the resistance to the "slip" of the steam bubbles through the water, but will enable the accelerated action of the former to increase the velocity of the latter and thereby improve general circulation and heat transfer results.

Heat Radiation, Convection, and Conduction

Heat Radiation. In a locomotive boiler the efficiency of combustion heat transfer through the firebox plates and boiler flues and tubes is from 20 to 25 per cent greater as applying to those heating surfaces directly affected when subjected to the radiant effect of the incandescent combustible and non-combustible particles which have passed through the minimum distance, than the heat-transfer efficiency when convection only is available. For example, when coal is hand or stoker fired and burned on grates or in retorts the radiant heat is at a minimum and applies only to the heat-absorbing surfaces adjacent to the fire bed, while the heat of convection is at a maximum; whereas when the coal is burned in pulverized form in suspension this condition is reversed. The locomotive boiler of the future will undoubtedly depend more largely on radiant heat.

With respect to the loss of power through radiation to the atmosphere, there is sufficient justification for completely and properly lagging the boiler, firebox, cylinders and heads, steam chests and all other radiating surfaces, as well as for polishing certain machinery parts, in order to reduce the dissipation of heat that now takes place through these parts from the existing steam pressures and superheat.

Heat Convection. In the present locomotive boiler by far the greatest proportion of the heat is imparted to the evaporating and superheater surfaces by convection.

To secure the fullest benefit from heat convection the combustion volumes and gas areas must be so coördinated as to establish a "velocity pressure" or " frictional" action between the gases and the heat-absorbing plates and tubes in order to increase the rate of heat transmission. Likewise must the boiler circulation be expedited in order to quickly disengage and release the steam bubbles from the water side of the same plates and tubes in the final heat transfer.

The possibilities for improving heat transmission by convection in the locomotive boiler, with its high water rate, i.e., a boiler horsepower for an average of less than 2 sq. ft. of total evaporating surface, fully justifies additional study.

Heat Conduction. The transmission of heat from one body of high temperature to another body of low temperature by contact, or from one part of a body to another part, is termed external and internal conduction, respectively.

Any increase in the rate of external conductivity, considering the present kinds and thicknesses of firebox, flue and tube materials as practically fixed, must be through an increase in the rate of flow of the heated gases, and this in turn means the expenditure of a greater amount of energy to pull these gases through the boiler.

While there is no difficulty in now obtaining a boiler horsepower from each 1½ to 2 sq. ft. of total evaporating surface, whatever

further improvement can be made in this direction will provide just that much more margin of boiler over cylinder horsepower requirements and produce a corresponding gain in efficiency.

Steam Generation

In present locomotive operation the quality of the steam, i.e., the percentage of vapor in a mixture of vapor and water, is one of the most important and least-referred-to factors in road and laboratory test reports, particularly as the average modern locomotive boiler is notorious for delivering saturated steam to the superheater or to the steam pipes with a high percentage of entrained moisture.

Road tests recently conducted on modern Mikado types of locomotives showed an average quality of from 94.7 to 96.3 per cent for the saturated steam as delivered to the superheater, indicating from 5.3 to 4.7 per cent of moisture, which is valueless so far as its power for doing work is concerned, but which greatly increases the work to be performed by the superheater by throwing upon it work which should properly be done in the boiler.

The delivery of dry saturated steam from the boiler is an item that has been given but little consideration in steam-locomotive practice, the principal idea having been to produce evaporating capacity and depend upon the superheater to perform auxiliary boiler functions. Many changes can and should be made to improve this condition.

Steam-Pressure Increase

One of the greatest and simplest improvements to be made in the steam locomotive can be effected by an increase in the boiler pressure in combination with greater quantity and better quality of saturated-steam production, higher and more uniform superheat, and compounding.

The writer advocated a steam pressure of 250 lb. in 1902 when with the Canadian Government Railways, and inaugurated the use of 235 lb. boiler pressure in combination with 21-ft. boiler tubes in 1903 in the Baltimore and Ohio Railroad Mallet articulated compound locomotive No. 2400, with excellent results from both an operating and maintenance standpoint. This at a time when the general tendency was to reduce rather than to increase locomotive steam pressures from an established practice of about 200 lb.

During recent years stationary-boiler engineers have not only determined upon their efficiency, but have inaugurated the use of relatively high steam pressures, and with the urgent necessity for keeping the cylinders as small in diameter and the reciprocating and revolving parts as light as practicable, there would appear to be no good reason for not now utilizing saturated steam of 350 lb. pressure, which, in combination with 300 deg. fahr. of superheat should provide, in addition to the many other advantages, a much greater opportunity for economy in power generation.

Steam Superheating

The use of superheated steam has done more to increase sustained hauling power, reduce fuel and water consumption and increase thermal efficiency than any of the other means and methods that have been generally adopted on the steam locomotive since its introduction, either singly or in combination.

With the average superheat now used, from 175 to 250 deg. fahr., the drawbar pull at a speed of 20 miles per hour is increased about 15 per cent, and at 50 miles per hour about 40 per cent, and due to the combination of superheat, larger diameter of cylinders and reduced cylinder back pressure—resulting from the use of superheated steam—it is possible to increase train tonnage about 30 per cent at speeds of about 30 miles per hour.

In the best existing steam-locomotive practice the superheat generally increases with the cut-off up to 50 per cent cut-off, beyond which there is usually a falling off in the superheat. Furthermore, with short cut-off a fair water rate, i.e., about 19 lb. per i.hp., can be maintained, but if the cut-off at the same speed is increased to over 50 per cent the superheat must be increased to about 300 deg. fahr. in order to maintain the same water rate, or otherwise, for example, at 67 per cent cut-off, the steam consumption will increase to 21 lb. or more per i.hp. This for the reason that as the amount of superheat is increased the range of temperature in the cylinder during the stroke of the piston is decreased until with sufficient superheat the changes in temperature cease entirely.

While the increased superheat results in a greater number of B.t.u. being exhausted from the cylinder, any such loss of a marked degree is more than offset by the smaller amount of heat exhausted per stroke, due to the fewer B.t.u. admitted to the cylinder per stroke at a given cut-off.

The use of highly superheated steam results in a saving of about 35 per cent of the total water evaporation per unit of power and in from 10 to 45 per cent saving in fuel when using steam, depending upon the power output.

Existing fire-tube superheaters produce the maximum superheat only when the locomotive is forced to its boiler capacity, whereas the maximum economy is more desirable when the locomotive is working under average conditions at economical cut-offs and when the superheater should give as nearly as possible a uniform degree of high superheat under all conditions of working, regardless of the boiler evaporation. For example, if the degree of superheat obtainable at speeds of 50 miles per hour with 50 per cent cut-off could be obtained at 25 per cent cut-off, a water rate of considerably less than 15 lb. could be obtained as compared with existing rates of about 19 lb. Therefore, as the present limitation in the hauling power of the modern superheated-steam locomotive is the capacity of the boiler to produce continuously sufficient dry saturated steam of high pressure and of the superheater to maintain a uniform high degree of superheat, the possibility of improving it by means of average higher boiler pressures and superheat temperatures and better utilization of fuel, steam and waste heat, in combination with radical changes in the design and arrangement of the boiler and superheater equipment and in the saturated- and superheated-steam connections, offers one of the greatest opportunities to increase efficiency and economy. This applies particularly to the larger locomotives, many of which consume more fuel and water and do less work than the smaller locomotives of the same general design and equipment.

While the superheater has generally been considered as a part of the boiler, particularly as regards its evaporation of entrained moisture in the saturated steam, it has no relation whatsoever thereto in so far as its individual functioning is concerned, and the more that the saturated-steam-conducting and superheated-steam-delivering conduits, as well as the superheater equipment in itself, can be divorced from the boiler and front-end connections and their proper functions, without introducing separately fired apparatus, the better will be the general results from the standpoint of efficiency, maintenance, operation and economy of the locomotive as a whole.

The steam temperature should be uniform for the variable speeds and capacities of operation. At the present time high temperatures obtain only at high speeds and capacities. A minimum temperature of 650 deg. fahr. quickly after starting, and of 700 deg. at maximum power and speed, would be much more effective and economical.

Steam Distribution and Utilization

Modern types of locomotives have developed at low speeds 3000 i.hp. and at high speeds 3200 i.hp., and comparative average

TABLE 3 COMPARATIVE WATER RATES OF LOCOMOTIVES WHEN USING SATURATED AND SUPERHEATED STEAM

Cylinders	Steam	Water rate per i.hp-hr., lb.
Single-expansion	Superheated	16 to 20
Single-expansion	Saturated	24 to 29
Double-expansion	Superheated	15 to 18
Double-expansion	Saturated	19 to 22

water rates through the complete range of the effective capacity of the locomotive, with piston speeds of from 600 to 1000 ft. per min., have been obtained as shown in Table 3.

At piston speeds of less than 600 ft. per min. the water rate of the double-expansion saturated-steam locomotive will approximate that of the single-expansion superheated-steam locomotive.

Compounding. With the exception of the Mallet articulated type of compounding, the multiple-expansion system of steam utilization, which has been so successful in marine and stationary practice, has not made the progress in this country that it has in Europe.

The failure of various types of cross, four-cylinder, four-cylinder balanced and tandem double-expansion locomotives, introduced from 25 to 15 years ago, to produce the predicted economy was due largely to factors of indifferent design, low boiler pressure, excessive condensation, lack of proper maintenance and operation, cheap fuel and road failures. Clearance limitations also restricted the size and arrangement of the low-pressure cylinders, while at the same time the single-expansion cylinder superheated-steam locomotives gave opportunity for greater hauling capacity and economy.

There is no doubt but that a properly designed superheated cross-compound locomotive embodies many advantageous features, such as greater starting and hauling capacity per unit of weight, less evaporating surface per indicated horsepower, reduced fuel and water consumption and less boiler repairs, and that it will return to favor for freight service in combination with higher boiler pressures and superheat, due to the necessity for greater drawbar pull and horsepower and for utilizing all superheat before its final exhaust.

Valve-Motion Gear. The Stephenson valve gear, through its variable lead for different points of cut-off, gives one of the best and most flexible steam distributions for locomotives. However, its undesirable and inaccessible location between frames and driving wheels and heavy revolving and suspended reciprocating wearing parts caused the writer, in 1903, to introduce the Walschaerts valve gear, a Belgian invention, in connection with the design of the Baltimore and Ohio Railroad Mallet articulated compound No. 2400.

The Walschaerts, as well as other outside valve gears now generally used, has the disadvantages of a constant lead and of being affected by the vertical displacement of the axle. By eliminating these disadvantages, however, and adding certain improvements for the purpose of increasing the ratio of expansion and shortening the ratio of compression, the tractive effort can be increased at lease 10 per cent at all points of cut-off and the fuel consumption reduced 5 per cent through ability to develop the same drawbar pull with a shorter cut-off. Such a change will add greatly to the efficiency of the steam locomotive, particularly when it is recalled that the average inside or outside valve gear slightly out of adjustment represents considerable loss in hauling power and in fuel economy. Tests made show that valves out of adjustment are responsible for from 8 to 21 per cent increase in fuel consumption per ton-mile as compared with valves properly set.

Where compound cylinders are used a steam-expansion regulator should be incorporated with the motion gear to effect the automatic independent adjustment of the cut-off for each of the high- and low-pressure cylinders for the purpose of obtaining certain cylinder ratios and at the same time bring the cut-offs in harmony at the center of the quadrant. In this way a compound locomotive of the Mallet articulated type can be made to develop at least 55 per cent of its rated tractive power at a speed of from 8 to 10 miles per hour, when operating at 25 miles per hour, and there will be a gain in tractive power of about 15 per cent at 25, and of about 10 per cent at 30 miles per hour.

Cylinder Clearance. The inauguration of the use of the inside-admission piston valve and of superheated steam has brought with it the wasteful effects of larger cylinder clearance, due principally to the use of a valve of too large diameter and an indifferent design of valve chest and ports in combination with the cylinder castings.

The use of smaller-diameter piston valves located close to the cylinder and connected with properly designed expanding steam ports will, in combination with improved material and workmanship, correct these generally existing deficiencies.

Cylinder Back Pressure. About 75 per cent of the cylinder back pressure is due to the use of the exhaust steam to produce draft for combustion, evaporation and superheat.

Much remains to be done in the way of enlarging exhaust-steam openings from the cylinder to the atmosphere and in reducing existing sharp turns, cramped passages and obstructions to the free passage of steam through them; and also in the development of an exhaust stand and nozzle that will combine the advantages of the single and double types.

Valves and Cylinders. Various tests on and many years' experience with inside-admission piston valves have demonstrated through the better use of steam and the resulting reduction of jerking, pulling and stresses on valve stem and gear, unbalanced pressure, frictional contact, valve and bushing wear, leakage, and lubrication, the practical advantages of a minimum diameter and weight of valve with the circumference no greater than the length of a slide-valve port and with every inch of bushing port made effective and designed in conformity with the well-known principles governing the flow of gases so as to eliminate eddies and baffling in the steam flow between valve and cylinder.

Piston Speeds. Frequent errors have been made in not properly proportioning the driver-wheel diameter and stroke of the piston. Slow speed and high ratios of expansion are factors particularly favorable to superheated steam and piston speeds of from 700 to 1000 ft. per min. will insure the best results.

Waste-Heat Distribution and Utilization

As a reasonable estimate would show that 40 per cent of the heat in the steam and in the products of combustion is exhausted from the stack, any considerable part of this heat that can be reclaimed for preheating boiler feedwater will add greatly to the overall efficiency of the locomotive and to the saving in fuel.

The principal means through which to accomplish this saving, in a practical way, are exhaust-steam heaters and flue-gas economizers, both of which can be readily adapted to a modern steam locomotive.

Exhaust-Steam Heaters. From actual service tests of closed types of heaters made on modern superheated-steam locomotives, using a portion of the main-engine exhaust steam only, it has been found that a feedwater temperature approximating 240 deg. fahr., or within 15 deg. of the exhaust-steam temperature, can be obtained without interfering with the draft required for maximum steam and superheat generation.

Flue-Gas Economizers. An economizer will heat the feedwater to a higher temperature than an exhaust-steam heater and will recover most of the waste heat resulting from high steam pressure and high superheat, as it is able to recover low-temperature heat that has escaped from the boiler evaporating or superheater surfaces because the average temperature of the feedwater within the economizer — which should, if practicable, be brought up to the boiler evaporating temperature — is much lower than the temperature of the water in the boiler.

As locomotive-smokebox superheaters, now obsolete, have demonstrated that 50 deg. of superheat may be obtained from flue gases at 600 deg. fahr., there should be no difficulty in devising a locomotive economizer that will produce very effective results in combination with high boiler pressures, superheat and draft, without baffling the boiler draft and evaporating capacity. In fact, with an average boiler efficiency of 60 per cent and an economizer efficiency of 50 per cent the possibility of recovering from 25 to 50 per cent of the stack-gas losses and increasing the thermal efficiency of the entire unit, is within the limits of possibility.

Friction and Resistance

Friction. The only form of useful friction to which the steam locomotive is subject is that which occurs between the driving wheels and rails for adhesive purposes. All other friction due to oscillation, concussion, rolling, wheel flanges and treads, journals, cylinders, valves, valve gear, crossheads, center and side bearings, coupled side play and the like, absorbs a considerable percentage of the power developed by the steam.

During the past ten years the increased rigid wheelbase and axle loads, greater lateral rigidity, larger cylinders, valves and revolving and sliding bearings, substitution of grease for oil lubrication, and greater number of frictional parts have tended to increase the machine friction and consequently the horsepower, drawbar pull, and steam and fuel losses, all of which are factors that should receive proper consideration in new designs.

Resistance. Other than the resistances resulting from machine friction, the locomotive is subject to those due to grades, curves, weather, wind and head air, which latter is more particularly affected by the general design.

While the complicated design of a steam locomotive, particularly as regards the application of its accessories, makes the use of relatively smooth outside surfaces generally impracticable, still much has been done along this line on some of the European railroads that can be adopted by us to good advantage.

Acceleration

In a steam locomotive the effects of inertia are distributed throughout the machine, due to the variable speed and action of the locomotive as a whole as well as of its reciprocating and revolving parts, and in order to indicate the force necessary to overcome this inertia and produce a particular speed in a given time, per ton of 2000 lb. of engine and tender, exclusive of the resistance due to grade, curvature and friction, the data in Table 4 may be of interest.

TABLE 4 FORCE REQUIRED IN LOCOMOTIVE ACCELERATION

From rest to given speed in miles per hour	Time allowed in seconds	Average force required per ton of engine and tender to overcome inertia only, lb.
10	60	16
20	60	32
30	60	48
40	60	64
50	60	80
60	60	96
70	60	112
80	60	128

As the train resistance increases and the drawbar pull of the locomotive decreases due to speed, acceleration rapidly becomes a diminishing quantity. Therefore in order to expedite train movement locomotives should be designed and adjusted so as to permit of the highest possible rate of acceleration in the shortest distance after starting, in order that the maximum desired running speeds can be reached in the minimum of time during which the greatest evaporating capacity of the boiler is available.

Deceleration

The deceleration or retardation of a steam locomotive is now universally produced by brake shoes brought against the treads of the driving and truck wheels by various means, the ideal method being where the maximum stopping effort is at all times under the positive control of the engineer. While the reversing of the engine with or without the use of steam effects varied degrees of stopping power without the use of brake shoes, this method is generally too slow and cumbersome for present-day requirements.

With the best existing air-brake practice a Pacific-type passenger locomotive weighing about 90 tons on 80-in.-diameter driving wheels and from 200 to 220 tons total for engine and tender in working order, will, when braked to from 110 to 90 per cent of the total weight, make stops on straight level track under good rail conditions, from a speed of 60 miles per hour, in distances of from 1200 to 1600 ft., and in from 25 to 30 sec., respectively, whereas from a speed of 30 miles per hour, under otherwise identical conditions, stops can be made in distances of from 275 to 325 ft., in from 12 to 13 sec., respectively. When braked at 150 per cent the stopping distance from a speed of 60 miles per hour can be reduced to about 1000 ft.

Deceleration is as much a factor in expediting train movement as acceleration, particularly with long and heavy trains and grades, and improved brake-shoe design, material, flexibility and bearing area in combination with clasp types of brakes for all wheels would do much toward providing greater stopping control over large and high-speed steam locomotives and thereby avoid the necessity for resorting to the use of the engine-cylinder back pressure to produce adequate braking power without liability for skidding and flattening the driving wheels.

Lubrication

It is false economy to restrict the quantity of lubricants used or to employ inferior lubricants to the extent that results in excessive friction, wear and tear, and any saving thus effected is many times over expended in delays, repairs, and fuel. At the same time probably no locomotive supplies are handled more wastefully or ignorantly than oil and grease, due to the lubricant not being applied or used in the proper manner.

Difficulty of access to the various bearings to be lubricated and the necessity for frequent hand oiling have no doubt contributed to lubrication waste and trouble, but during the past 15 years the substitution of grease for oil on many bearings, the use of larger driving wheels and lower piston speeds, and greater accessibility to certain parts as obtains from the use of outside instead of inside valve gears and journals, have brought about a substantial improvement.

Special Appliances

The steam locomotive, other than the boiler, engine, frame, running gear and tender proper, is largely an assembly of special appliances for firing, combustion, superheating, steam distribution and utilization, feedwater delivery, lubrication, insulation, heating, lighting, safety, and labor saving, and of devices such as trucks, axles, wheels, tires, springs, bearings, brakes, draft gear and boiler fittings.

These appliances and devices are the result of highly specialized research, designing and experimenting by the railway supply and equipment companies, who in turn are largely responsible for the development of the steam locomotive which has occurred during the past fifteen years.

With the cost for locomotive fuel and repairs averaging over 75 cents per mile run, or five times what it was ten years ago, the cost for the essential design, material, construction and equipment of the locomotive must now be placed on an engineering rather than on a purchasing price basis in conformity with other high-class machinery if more efficient and economical operation and maintenance results are to be obtained.

Power for Accessories

The steam locomotive must not only produce superheated steam for the development of drawbar pull, but also supply saturated steam to various accessories of its own and for train operation. For example, a modern passenger locomotive is required to supply power to operate locomotive and train air brakes and signals as well as train lighting, heating and ventilating equipment, and hot- and cold-water systems, and in addition it must supply steam or compressed air for the operation of a multitude of devices. As high as 20 per cent of the fuel as fired for an average divisional run may be used for these accessories.

Not only has the use of compressed air been found to be most expensive for the working of these accessories, but the reserve supply for train braking has been frequently drawn upon for their operation. As power reverse gears, fire doors, water scoops, coal pushers, ashpan doors and like devices can be equipped for steam operation, such substitution offers possibilities for less drain on the boiler and much-needed economy in the cost for this auxiliary power production. Moreover, as all of this power for accessories is produced by saturated steam, some means for substituting the use of superheated steam for those purposes where it is more suitable and economical should be given due consideration.

Octaval Notation in Shop Measurements

By ALFRED WATKINS, HEREFORD,[1] ENGLAND

This paper is an argument for the adoption of a system for measuring binary inch fractions. At present there are two systems: the first divides the unit into halves, quarters, eighths, etc., and the second makes use of a decimal notation. The author proposes to replace these by an octaval notation in which eight is to be used as the radix. After explaining the method of constructing such a notation, the author discusses its application. A description of various types of measuring instruments with octaval notation shows its many advantages. The following instruments are discussed in detail: octaval rule, simple vernier calipers, double vernier calipers, single-screw micrometer, and two-screw micrometer. The author states that it is not his intention to propose the substitution of octavals for decimals in all branches of engineering, but he does advocate their use to denote the British binary inch fractions in the workshop and on workshop measuring instruments.

A RECENT investigation into the usage of coinage, weights and measures of all kinds, summed up in the author's pamphlet, Must We Trade in Tenths, showed two distinct and clashing tendencies. The first, which is prevalent in all branches of commerce and craft, is to divide a unit into halves, quarters, eighths, etc., down to sixty-fourths. The second tendency is on the part of the man who has more to do with computation than actual exchange or craft. He, finding a decimal notation all cut and dried and usable with easy facility, is thoroughly impatient with any other method, and wants his to be universal and compulsory. To this class belongs the counting-house man, the schoolmaster and the scientist, who have never entered into the unexplored science of commerce and handicraft. And as we all, with a slight exception in dozens, count upward from unity in a ten grouping, many of us are apt to decide that the ten grouping is also an inevitable division of the unit downward. But this ignores the general fact that no market man or craftsman does divide a unit into tenths until forced by the counting house into doing so. The figure ten only halves once into a whole number, and after that each halving adds an additional decimal place. The ten grouping is not the only scale of notation and such textbooks as Hall & King's Elementary Algebra point out those with a basis or radix of 6, 8, 12, 16, or any other numbers and give rules for the conversion of one notation to another. It is exceedingly unlikely that we shall disturb the ten grouping for our counting from unity upward. But there is not the slightest difficulty in expressing parts of a unit in modern fractions of some other radix than 10.

Unfortunately there is no notation which fits perfectly with all fractions used in commerce or craft. The three groups of fractions most used are 3ds, 6ths and 12ths; 5ths and 10ths; and the binary group, 4ths, 8ths, down to 64ths. The last group is undoubtedly used more than all the others put together, especially in the mechanical division of a unit of length, and a numeration with a binary radix is best. As a radix of 16 would necessitate the selection of six new numbers, 8 is the scale of notation to select, and it fits the engineer's binary inch fractions to perfection.

An octaval fraction is distinguished from a decimal fraction by a special mark, the small circle or "pip," originated by the author, and placed in the same position as the decimal point. Octaval fractions can be added, multiplied, etc., with much the same facility as decimals and far easier than vulgar fractions, as for example:

Vulgar	Octaval
$\frac{1}{2}+\frac{33}{32}=\frac{32}{64}+\frac{33}{64}=\frac{65}{64}=1\frac{1}{64}$	$_{\circ}4$ $_{\circ}41$ $1_{\circ}41$

Note that as 8 is the radix, it becomes 10 in all octaval arithmetic.

In the structure of octavals, just as 0.2345 in decimals

$$=\frac{2}{10}+\frac{3}{10^2}+\frac{4}{10^3}+\frac{5}{10^4}$$

$$=\frac{2}{10}+\frac{3}{100}+\frac{4}{1000}+\frac{5}{10{,}000}$$

$$\text{so, } {}_{\circ}2345 \text{ in octavals} =\frac{2}{8}+\frac{3}{8^2}+\frac{4}{8^3}+\frac{5}{8^4}$$

$$=\frac{2}{8}+\frac{3}{64}+\frac{4}{512}+\frac{5}{4096}$$

Application to Inch Fractions

The foregoing explanation leads up to the subject of this paper, which is the practical application of octaval notation to the construction of micrometers, calipers and measuring rules, and the great ease and facility it imparts to the measurement of the allowances and limits so much used in precision work. Our present crude blend of decimal allowances with standard binary fractions is complex and illogical, and it would seem that as a "limit" table is based on the square root of the diameter of the part, it can be more accurately and simply compiled in octavals than in decimals. The structure of an octaval fraction is much on the lines of a mechanic's mental conception of the fraction. Thus $_{\circ}42$ ($\frac{4}{8}+\frac{2}{64}$) for the fraction usually called $\frac{17}{32}$ is obviously half an inch plus a thirty-second. It should be also noted that the octaval figures are continuous, so that adjacent fractions as $\frac{1}{2}$ and $\frac{33}{64}$, so inconveniently expressed now, are in octavals $_{\circ}4$ and $_{\circ}41$, obviously adjacent. With an octaval radix the counting omits 8 and 9, and goes directly from $_{\circ}7$ to $_{\circ}1$, from $_{\circ}17$ to $_{\circ}2$ and so on until $_{\circ}77$ is reached, when the next value upwards is 1 0 or unity. The

octaves of the eighties and nineties are omitted as well as the single figures 8 and 9.

Measuring Instruments with Octaval Notation

It will be noticed that in the instruments illustrated (Figs. 1-4) all, or almost all, the divisions can be marked with figures indicating their value, and that, except in the case of the rule, there are no very fine divisions to try the eyes. It should also be noted that in each case there is a separate scale for each place in the fraction, each figure of it being read separately, so that no addition is necessary to get the results.

Octaval Rule. The octaval rule, Fig. 1, shows that all the eighths are figured, and the figures form the first place in the octaval fraction. The writer has devised an original way of indicating the subdivisions of the eighths (the sixty-fourths) in staircase fashion which enables the alternate even numbers to be marked, and these numbers constitute the second place in the octaval fraction. This method of a different length of line for 2, 4 and 6 allows the value of the indicated division to be known, even if it is not uncovered by the thimble or sliding bar of a measuring instrument. It is applicable to decimal divisions and to ordinary and slide rules.

Simple Vernier Calipers. The simple vernier calipers shown in Fig. 2 measures down to 64ths, and yet the divisions are scarcely finer than eighths. The vernier method is used, and every division is figured. The index line points to the first figure of the fraction, or beyond it, short of the next division, and the vernier line which coincides with any upper division is marked with the second figure of the fraction. A partial dislike to the vernier method is probably due to their usual association with fine eye-straining divisions.

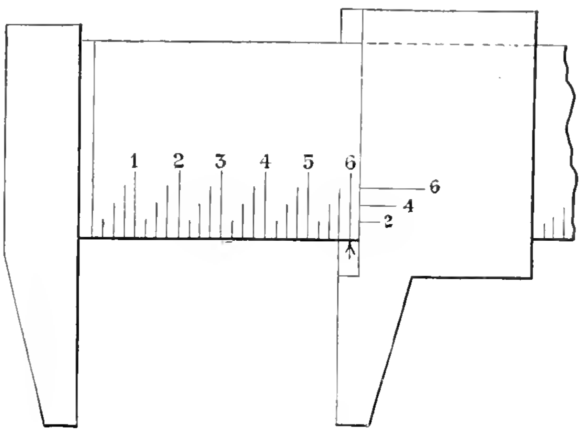

Fig. 2 Simple Vernier Calipers

Double Vernier Calipers. A flat model of the double vernier calipers is illustrated in Fig. 3 in order to show its action more plainly, although it is quite probable that a model with a circular stock will be the commercially useful one. The standard fraction is set, in two places of octavals, exactly as in the instrument already described. A fine movement for the 3d and 4th octaval places is frictioned on the coarser movements. It is a double wedge with a taper of 1 in 32, and a movement of 1/16 in. on this cross slide moves the calipers $\frac{1}{512}$ or ${}_0001$ in the third place of octavals. The 4th octaval place is indicated by a vernier scale. In this, as in the next instrument, the 1st, 2d, 3d and 4th scales are lettered *A*, *B*, *C* and *D*. The advantage to which reference has been made of devoting two scales to the main fraction and the two others to the allowance, shows up very strongly in this instrument, for there is a separate plus and minus scale for the allowance. The mechanic has therefore only to set one part of the calipers for his main fraction and the other part for his allowance, either plus or minus, and has no pencil or mental calculation to make. No decimal instrument can do this unless the standard main fractions adopted are tenths or hundredths. It will be noticed that the construction remedies a fault in previous beam calipers which had the pull of the fine adjustment on one side of the main axis of the instrument. When used to caliper the exact size of an unknown dimension, the jaws are adjusted to the size, and a front clamping screw, not shown, is tightened on the beam, the rear screw being left loose. The fine adjustment is then worked so that a vernier line on the scale *B* coincides with an upper division. The *C* and *D* scales then indicate the variation from the standard fraction. It should be noted that this construction makes the reading of the second place of the fraction different from previous instruments. With this one it is always set exactly for the precise standard fraction, and the fine adjustment does not alter this setting, but indicates how much more, or less, than the standard the dimension is, or is intended to be.

Two-Screw Micrometer. The two-screw micrometer shown in Fig. 4 is the result of the author's conviction that the separation of the scale for the main fraction from that of the allowance, rendered possible by their being expressed by different places in octavals, is a great practical convenience. In this instrument the standard fraction is measured by the usual screw on the right hand. It is of 8 pitch, probably 4 threads. It indicates the first octaval place,

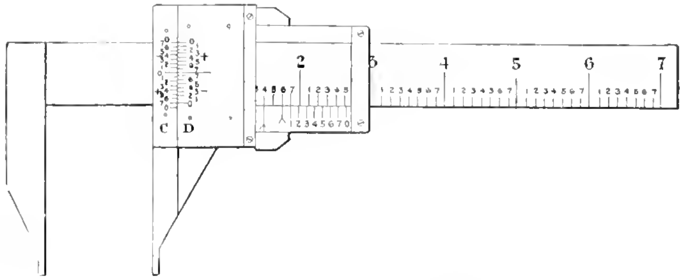

Fig. 3 Double Vernier Calipers

eighths on the index line, which also points to the 8 divisions on the thimble for the second octaval place. For measurement of the main fractions this is all that is required. The end usually occupied by a fixed anvil is fitted with a measuring screw for the allowances, 3d and 4th octaval places, which is kept at zero until required. This is a 32-pitch screw, it has a range of one revolution only, and its thimble has a double scale starting each way from 0 for plus or minus allowances. The 4th octaval place is read by a vernier scale. The workman, therefore, sets his standard fraction on the coarse screw, turns the micrometer round and sets his plus or minus allowance on the fine adjustment, there being no calculation either for him or for the draftsman. As illustrated, the fine adjustment was used left-handed, but it would probably be figured to use it on

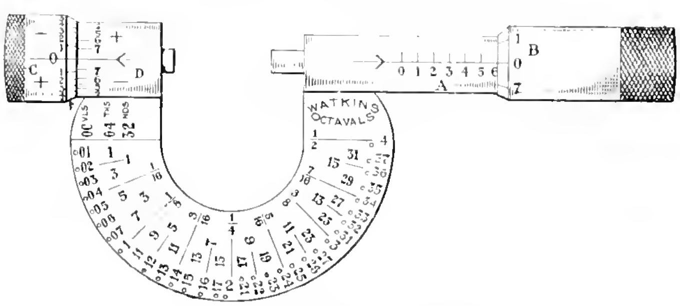

Fig. 4 Two-Screw Micrometer

the right hand, and the position and the use of the vernier would then be exactly those that workmen are familiar with in the present instruments.

To measure an unknown dimension in four places of octavals, the coarse adjustment is first set to the article which is withdrawn, and the screw screwed in to register the nearest (smaller) standard fraction. The final measurement is then made with the fine screw which would probably be fitted with a ratchet, and the instrument would then read for the four places of octavals expressing the dimension. The fine adjustment end can be used alone for measuring fine dimensions less than 1/64 or the coarse-adjustment screw alone for the main fractions.

Thread Forms for Worms and Hobs

By B. F. WATERMAN,[1] PROVIDENCE, R. I.

The use of worm gearing is steadily increasing, and accompanying it, perhaps the cause, is a corresponding increase in efficiency and durability which is the result of a better understanding of both the theoretical and mechanical problems involved. The following paper is a discussion of these and failure to take them into consideration in the past has often led to the discrediting of this form of drive. This paper also suggests methods for bringing about a uniform and satisfactory practice in worm gearing.

IT is only recently that engineers have considered a worm gear in any other light than that of a necessary evil, and this is probably due to the fact that heretofore the finer points of manufacture were not appreciated and were not obtained except in those places where this type of gear had received more than the usual amount of study. The actual manufacture of the worm and gear, however, presents certain mechanical difficulties and inaccuracies

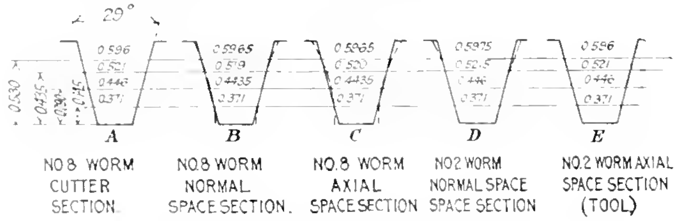

Fig. 1 Double-Threaded Worm

which are not apparent in any theoretical discussion of the subject. These difficulties appear in making the worms and hobs, especially with multiple threads, in fact it might be said they appear in making worms or hobs whose helix angle is greater than 18 deg., and although no attempt has been made to show these difficulties mathematically enough models have been made to clearly indicate them. These uncertainties are due to the differences in the thread forms produced by the different methods of cutting the worms; first, with an axial tool, the use of which is limited to a rather low helix angle; second, with a normal tool which has no limit for angle; and third, with a rotary cutter.

The most common worm has a single thread. This is usually made with the sides of the threads on the axis forming an included angle of 29 deg., and it can be cut with a lathe tool of 29 deg., the cutting edge of which is set parallel either to the axis or to the normal section. It can also be cut with a rotary cutter of the same included angle in a thread milling machine. In other words, the hob which must be backed off with a tool, set either to the normal or on the axis, can be made either way, and the wheel produced will mesh properly with the worm made in either of the three ways just mentioned.

To demonstrate the difference above mentioned, 13 worms were made to the dimensions given in Tables 1 and 2, which also gives all the necessary working information for producing them. The pitch diameter and axial pitch are the same for all, and this applies equally well to double threads, except that in the case of double threads the difference between the normal and axial sections begins to be noticeable. In the case of worm No. 8, Table 1, which was cut with a straight-sided milling cutter, it will be noticed that the thread is perceptibly convex. This difference is shown in Fig. 1, where the dimensions of the cutter which cut worm No. 8 is shown at *A* with the dimensions of tools fitted to the normal and axial sections at *B* and *C*. In all the references to the normal or axial sections, it is to be understood that the space section is meant.

This method of analysis permits a visual inspection of any difference in shape of thread, as the model or dummy worm can be held to the light and the difference readily seen. The figures show in

thousandths of an inch what the difference is, the dotted lines showing divergence of the sides of the teeth from the straight line in an exaggerated way.

A tool fitted to the normal of worm No. 2, Table 1, is shown at *D* in Fig. 1, and can be compared to the axial section shown at

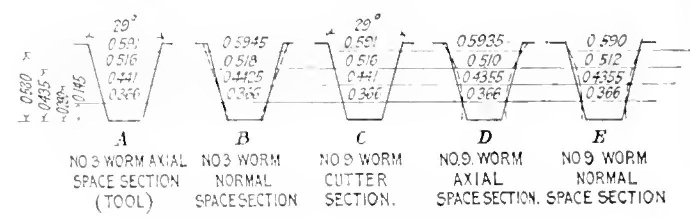

Fig. 2 Triple-Threaded Worm

E. While the difference in shape is noticeable and measurable for a double-threaded worm for all practicable purposes, the statement made about a single-threaded worm holds true for a double-thread. When a triple-threaded worm is considered, the method of cutting becomes of greater importance, since the difference in form between the axial and normal sections (which results from the different methods of cutting) is great enough to require that the hob teeth shape be made exactly like that of the worm. This appears to be a superfluous statement, but it is the exception for a purchaser of a hob to state how he intends to cut the worm, no matter how many threads it has.

Worms No. 3 and No. 9 are triple-threaded, No. 3 being cut with an axial tool in a lathe, and No. 9 with a rotary cutter. The difference in the normal and axial sections of worms No. 3 and No. 9 are shown in Fig. 2. The difficulty just mentioned as to

cutting clearance on the axial lathe tool may also be experienced with a hob that has axial grooves, so that when the angle becomes 18 deg. or greater, it is well to use spiral grooves, as the hob, unless it has ample radial clearance, may drag on one side.

A more extreme case, but now a very common one, is a five-threaded worm where the helix angle is approximately 30 deg. The angle of the thread at the root governs the clearance angle on the tool, and in the case of worm No. 4, the bottom helix angle is 35 deg., 39 min., and in worm No. 5 the helix angle at the bottom is 36 deg., 48 min. The depth of worm No. 4 is based on the normal pitch, while the depth of No. 5 is based on the axial pitch. The shallower tooth eliminates some of the difficulties experienced with these extreme helix angles, and it is good practice to use the normal depth as soon as 18 deg. angle is reached, or when spiral grooves are used in the hob. With a helix angle of 45 deg., which is quite common with axial depth, and 29 deg. thread, either axial

or normal, it is very difficult to make the hob, as the tool must have such excessive clearance at the point that it may not be possible to make the hob with a tool that can be sharpened without changing its thickness. Also, the hob tends to drag on the side, and any distortion in the hob or in the worm, due to hardening, interferes very much with the meshing of the worm and wheel. The differences in the shape of the various sections of a five-

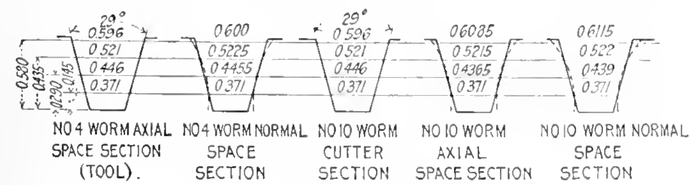

Fig. 3 Five-Threaded Worms

threaded worm as made with the straight-sided tool are shown in Fig. 3.

Worm No. 10 has five threads, and was cut with a 29-deg. included-angle cutter, 3½ in. diameter, and the differences in shape between tools fitted to the normal and axial sections of No. 10 worm may be compared with the normal and axial sections of worm No. 4.

When the helix angle is greater than 18 deg., it is well to consider using a greater pressure angle. To illustrate, worms No. 11 and 13 were made and cut with a cutter whose sides formed an included angle of 50 deg. No. 11 was cut with a cutter of 3½ in. in diameter and No. 13 with one 6 in. in diameter. This change in size of cutter was made to show the difference in shape produced by two cutters of different diameters.

The most durable pair of worm gears is that with a hardened and ground worm. If the worm is to be ground, the shape of the worm thread must be such that the thread surface can be readily reached, and when the wide angle cutter is used this is possible. The best cutter to use is the one that will give ample working space. This angle should be no greater than is necessary to obtain such results, as the smaller the angle the better, because the pressure on the bearings varies about as the tangent of the angle of pressure.

Worm No. 13 might be considered as having been ground with a wheel 6 in. in diameter, and the difference in the shape on the axial and normal sections between Nos. 11 and 13 is shown in Fig. 4. A worm might be cut as No. 11 with a cutter 3½ in. in diameter and ground readily with a wheel 6 in. in diameter. The error is principally at the outside of the worm thread, since there

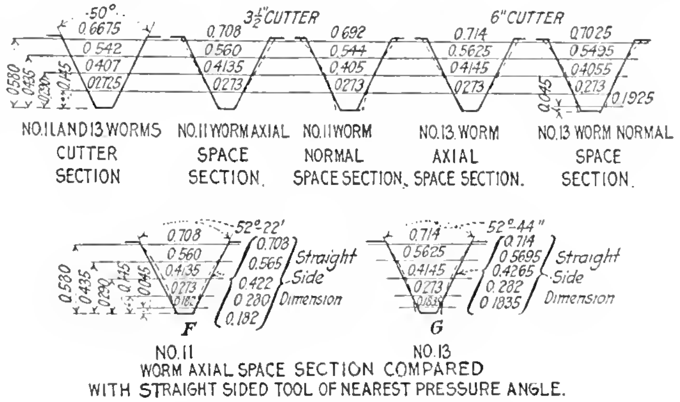

Fig. 4 Five-Threaded Worms

is a decided rounding off at this point. The hob made to conform to the finished worm would produce a shape to suit the ground worm. Fig. 4 shows, at F and G, how nearly straight the sides of the teeth are on both No. 11 and No. 13, a tool fitted to the axial section being compared with a straight-sided tool. This is also interesting, as it forestalls the fear that there may be a loss in efficiency due to the lack of straight-sided teeth on the axial section. Another advantage of this cutter is that it has straight sides, which, as a starting point to make a worm or hob,

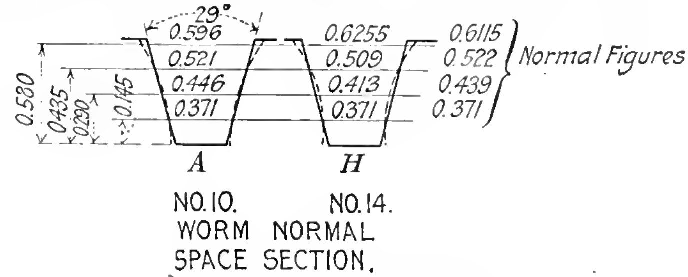

Fig. 5 Five-Threaded Worms

is most simple. This cutter can also be made as an ordinary milling cutter which cuts more freely than a formed cutter which must be used if the section is other than that produced with a straight cutter.

If it is known that a given included angle is the basis for the cutter, it can be produced by any one, even if its diameter is not known, as quite a difference in cutter diameters can be used without any serious difference in shape. It must be borne in mind, however, that the greater the angle of the cutter, the less is the variation in shape due to the diameter of cutter.

Another method of producing worms with five threads would be to hob them. Worm No. 14 was cut with a single-threaded 14½-deg. pressure angle hob (29 deg. included angle), and the shape of the space on the normal is shown by dotted lines in Fig. 5, at H; this is compared with the normal section of worm No. 10, Fig. 3, and is reproduced at A, Fig. 5. It is apparent that this method produces something quite different and a shape that cannot be readily ground. If a hob of 25 deg. pressure angle or 50 deg. included angle on the axis was used, the shape produced would be much nearer that of worms Nos. 11 and 13.

That there is a general lack of knowledge of the foregoing facts is apparent to any one who is familiar with the manufacture of worm gears and the tools for producing them. It would be desirable to establish and follow a standard line of procedure as the use of worm gears is increasing rapidly. Any method adopted, however, should be based on simple principles, such as straight-sided cutters with a change in pressure angle at some stated angle of helix and a change from axial to normal depth at the same point, and the desirability of this latter method is due to its mechanical advantages and not to any theoretical ones.

Modern Electric Furnace Practice in Foundries

By W. E. Moore,[1] Pittsburgh, Pa.

In this paper the author first enumerates the superior properties of electric steel and then points out the advantages of the electric furnace over the open-hearth method. He also discusses the features of the various classes of arc furnaces which have made that type practically supreme in the field. Following this the crucible and converter processes are briefly described and it is shown how the acid type of furnace is best suited for foundry work. Comparative operating costs of producing liquid steel by the converter and electric-furnace processes are also given, and these bring out the marked economy of the latter. The paper concludes with notes on the employment of the electric furnace in malleable-iron foundries, and on the selection of the most suitable type of furnace for a given installation.

Up to the present time the electric furnace has seen its largest commercial development, first, in the manufacture of aluminum, second, in the manufacture of steel, third, in the manufacture of ferroalloys, and fourth, in the manufacture of calcium carbide. At the end of 1913 there were only nineteen electric furnaces installed in the steel-making industry in America. This number had increased to 136 at the end of 1916, and to 269 at the end of 1917. At the present time the number of steel-making furnaces in use in various industrial countries of the world is 815, of which 290 are in the United States and 45 in Canada.

The average capacity of these furnaces in America is 0.37 tons per heat when used for ingots, and in the foundry business, 1.7 tons per heat, though the ordinary size now most generally used in foundries is the 3-ton. More than 99 per cent of all the steel-making furnaces are of the arc type, less than 1 per cent being of the induction type, which was popular in the early days of the art.

Electric furnaces are used for the following principal purposes in the metal industries:

a Forging steels, tool steels, alloy steels, etc.
b Making steel castings in foundries
c Making high grades of strong cast iron for difficult or fine castings
d Melting brass, bronze and other non-ferrous metals.

Properties of Electric Steel

Primarily, electric steel became popular because of its superior physical properties. While such steel can be made with a more satisfactory chemical analysis, using a given grade of raw materials, than by other processes, experience has abundantly demonstrated that when made according to the same chemical analysis it will have about 15 per cent greater tensile strength or ductility, depending upon its heat treatment, and that it is more resistant to shock and better able to receive heat treatment. The reason for this is that the steel, being made in a closed furnace and in a reducing atmosphere away from the contaminating influences of combustion gases, is more solid, freer from gases, and less prone to non-metallic inclusions of slag oxides. As an example, the tests in Table 1, made by R. W. Hunt and Company, Chicago, January 30, 1919, for the Chicago Surface Lines, illustrate the physical properties of A.E.R.A. specification heat-treated electric-furnace axle steel. It was heated from 1450 to 1460 deg. fahr. held one hour, quenched in 65-deg. oil, drawn from 1185 to 1200 deg. fahr. for one hour and then slowly cooled in the furnace. The open-hearth steel was also heat-treated in the same manner.

TABLE 1 COMPARISON OF OPEN-HEARTH AND ELECTRIC-FURNACE STEEL

	Open hearth	Electric furnace
Elastic limit, lb. per sq. in.	41,060	64,850
Tensile strength, lb. per sq. in	89,100	105,140
Per cent elongation in 2 in.	21.5	22.0
Per cent reduction of area	31.74	52.37
Elastic torsion	16,750	33,700
Character of fracture	Granular	Silky cup

The Bureau of Standards reports regarding the superior qnalities of electric steel as follows:

The characteristics of electric steel are great homogenity and freedom from segregation. It is somewhat higher in tensile strength and elastic limit than other steels and owing to its greater density, shows a marked resistance to fatigue.

Being absolutely "dead" when properly made and averaging lower in sulphur, electric steel in the foundry is less liable to show shrinkage cracks between ribs of castings, and, being more fluid, it is not so liable to piping, blowholes, cold shuts or misruns, and in tool steel it takes heat treatment more effectively and will stand greater abuse in heating.

The electric furnace is especially useful for making alloy steels. Since the metal is treated in a reducing atmosphere, there need be no large losses of the added elements, such as silicon, manganese, vanadium and chromium, which in the ordinary open-hearth practice are oxidized in large quantities and carried to waste in the slag, thus producing uncertain mixtures. Indeed, the added elements in open-hearth practice frequently show losses of from 30 to 50 per cent, while in the electric furnace they will be practically nil.

With the electric furnace it is much easier to carry the finishing operation to a more exact limit in carbon and silicon content than is practicable in the case of the open-hearth furnace. Gases of solution and inclusion, such as oxygen and nitrogen, are also eliminated.

Electric Versus Open-Hearth Furnaces

In open-hearth furnaces it is impracticable to melt down fine scrap, such as turnings in quantity without excessive additions of pig iron, for the reason that the oxidizing flames, which furnish the heat to the furnace, will reduce the metal when in an attenuated form to a mass of oxide before it becomes molten, whereas with the electric furnace it is entirely practicable to melt turnings exclusively, which, under ordinary market conditions, are purchasable at a price from five to ten dollars per ton lower price than that for the heavy melting grade of steel required in open-hearth practice.

In the electric furnace it is possible to obtain a heat-transfer efficiency of from 60 to 70 per cent of the heat energy of the electric power supply put into the molten charge, whereas with open-hearth practice the efficiency ranges from 8 to 15 per cent and in a crucible practice from 2 to 6 per cent. The fuel-developed heat unit of the open-hearth furnace is, however, bought in a much cheaper form than the heat unit supplied by electric power, and if the electric furnace did not have the other advantages mentioned it could not at present compete against the open-hearth furnace on the basis of cost.

On account of the very intense heat of the electric arc, it is entirely feasible to melt down and refine a charge of foundry steel in one hour or less which in the open-hearth furnace might require from 6 to 14 hours. In other words, a 12-ton electric furnace may be practically equivalent to an 80-ton open-hearth furnace, so far as steel output is concerned, and involve far less installation cost.

The Arc Type of Electric Furnace

The arc type of electric furnace is practically the only one being installed for steel making today, although induction-type fur-

[1] Director of Research Laboratory, Aluminum Castings Company, Cleveland, Ohio.

naces are in use. At first glance the induction-type furnace appears to have many advantages over the arc-type furnace, but practice has shown that it is in no way a competitor of a properly constructed arc furnace. In large sizes the power factor is extremely low, the efficiency of the furnace poor, and the cost of replacing the refractories very high.

Arc furnaces may again be classified into long-arc and short-arc types. There are many theoretical inducements for using the long-arc furnaces. With a given energy input, the electrode is correspondingly smaller and the electrode cost therefore reduced proportionately. With the water-cooled bottom-contact type of furnace either the furnace size must be kept small or the voltage must be greatly increased in order to keep the current low and prevent that form of contact from overheating; hence, it is the custom to operate the bottom-electrode furnace with quite a long-arc and low current, and in small sizes only.

Arc furnaces may again be classified into single-phase, two-phase and three-phase types. The single-phase furnace is ideally simple but is poorly adapted to modern power-plant conditions, as central-station power today is universally generated and transmitted in three phases. The long-arc single-phase furnaces, too, have the very great disadvantage of operating on extremely low power factor, thus causing a great waste in transformer, line, and generator capacity, which usually makes them prohibitive from the central-station man's viewpoint in any but quite small sizes, say ¼-ton to 1-ton capacity per heat.

The two-phase furnace may be operated either from two or three-phase power, but when operated from the usual three-phase power the phases have to be transformed by Scott-connected transformers, which are more costly, less efficient and frequently unbalance the power system. The two-phase furnace is usually built with four arcing electrodes and, while it gives a theoretically balanced load on the power system, it has the objection of requiring an additional electrode, which increases the electrode consumption 33 per cent over the three-phase furnace.

The three-phase furnace for installations of moderate and large size is the most universally satisfactory and popular furnace, fulfilling all the conditions as to balanced load and high-power factor required by the central stations, at the same time giving the minimum electrode loss and the simpliest form of automatic-electrode-adjusting gear.

It is possible to obtain satisfactory operation of the direct-arc-type furnace for melting non-ferrous metals only where the content of metals which volatilize at low temperatures is small, as, for instance, in making bronze and low-zinc metals. Where the zinc or aluminum content is high, as in yellow brass, Muntz metal, etc., this type of furnace is very unsatisfactory and results in great waste of the more volatile metals and the making of porous castings. Consequently special furnaces of the resistor, rocking, rolling, tumbling induction or distributer-arc types are required, the latter referring to furnaces in which the heat of the arc is transmitted by radiation alone.

Disadvantages of Crucible Furnaces

The crucible furnace is the oldest method for making steel castings and of making first-class tool steels. However, it is now being practically displaced by the electric furnace, which has many advantages such as rapidity and reduced cost, and the ability to make sounder castings and better tool and alloy steels. Due to the absorption of carbon from the crucible, it is difficult to make castings low enough in carbon to obtain the ductility desired for many purposes. Furthermore, the steel reduces the silica from the clay of the crucible, tending to run the silicon content of the product high. The overpowering objection to the crucible process, however, is the high cost of the products, due to:

a High cost of pure melting stock, as no refining is practicable

b Very high labor cost on account of the small heats handled

c Extravagant fuel consumption, sometimes using 3 tons of coal per ton of steel

d High cost of crucible renewals, often averaging two to four crucibles per ton melted and costing \$9 to \$11 each or \$18 to \$44 per ton.

For these reasons the crucible-melting shop is rapidly going out of use for castings, as well as for tool steels.

The Converter Process in Steel Founding

During recent years the side-blow converter process has become very popular in steel foundries making castings of medium and small size. This process requires high-grade, high-silicon, low-phosphorous and low-sulphur pig iron to be melted in a cupola furnace with the finest grade of coke obtainable. The advantages of the converter process are: The steel may be made fluid enough for reasonably thin castings; the heats, usually running one to two tons, are of convenient size to be poured off quickly before cooling; the fuel consumption is moderate, averaging from 400 to 600 lb. of coke per ton; the first cost of the apparatus is low, and the process is available for intermittent service.

The disadvantages are: The metal must be handled twice in the ladle; the metal picks up sulphur and phosphorus and nitrides from contact with the fuel and the air blast; the losses in the cupola and converter are quite high, running from 16 to 24 per cent, further concentrating and increasing the percentages of impurities in the original metal and wasting costly melting stock; the steel is full of oxides and gases and requires large quantities of expensive ferroalloys to kill; the quality of the steel physically, as well as chemically, is below par; a heat once blown too cold cannot again be brought up in heat enough to cast and must be "pigged"; only the highest grades of melting stock may be used, costing generally \$15 to \$25 per ton more than for the acid open-hearth furnace and \$20 to \$35 per ton more than for the electric furnace; and the refractory maintenance is high, as the cupola and converter linings must be repaired after each 10-hr. run. Liquid-metal costs of converter steel frequently run up to from \$60 or \$80 per ton.

The electric furnace is the most modern steel-producing agency and is gaining in popularity more rapidly than all others. It is the most compact furnace, and the rapidity with which it will melt down cold charges adapts it splendidly to the making of steel castings, as well as forging and tool steels. It is the cleanest and most certain method of making steel, and its small bulk makes it feasible to locate the furnace near the center of the floor where the metal need be transported short distances only.

Acid-Type Electric Furnace for Foundry Work

The acid-type furnace is best suited for foundry work and the most popular size has a capacity of 3 tons per heat, though sometimes 1.5-ton or smaller furnaces are required. The more highly powered and rapid furnaces for such work turn out from 8 to 16 heats in 24 hr., and with a power consumption of from 500 to 650 kw-hr. per ton of liquid steel and considering the ultimate efficiency of the large modern turbo-generator power house at, say, 1.5 lb. of coal per kw-hr., its fuel consumption might be said to be equivalent to from 750 to 900 lb. of coal per ton melted, and the coal need not be of high grade nor low in sulphur and phosphorus as is necessary with fuel-fired furnaces. Basic furnaces require more time and power, heats ranging from four to eight per day, and since the charge is melted in a reducing atmosphere there is practically no oxidation of the metal; consequently thin scrap, light turnings or scrap of other forms such as can be conveniently charged into the furnace, may be melted. Such scrap on the present market sells for approximately from \$5 to \$10 per ton less than low-phosphorous, heavy melting scrap necessary with the ordinary acid open-hearth melting-furnace installation.

The furnace atmosphere, being of a reducing nature, makes it easier to refine and kill the steel, resulting in a saving amounting frequently to half of the ferroalloys necessary with converter steel, effecting a saving of, say, \$2 per ton. The melting losses in the electric furnace are much the lowest of any modern process, aver-

aging from 2 to 5 per cent as against 6 to 9 per cent in the open-hearth and from 16 to 21 per cent in the converter process.

The electric furnace does not contaminate the metal as do fuel-heated furnaces and an acid electric will therefore readily make No. 3-U.S.A. specification steel, whereas it nowadays is practically impossible to find melting stock sufficiently pure to do so with the converter process. The saving alone in the cost of melting stock will more than pay for the entire conversion cost of electric steel. The greatest points in favor of the electric furnace are the much higher grades of steel produced and the higher percentage yield in castings and bars.

Comparative Costs of Electric and Converter Steel

With the electric furnace, men can more readily make and check their steel to an exact percentage of carbon, manganese and silicon and can more easily keep the undesirable sulphur and phosphorus to low limits than by any other process. The steel may be readily alloyed with nickel, chromium, and vanadium to make the higher grades of steel castings to replace forgings and for special purposes, such as may be required for parts of unusual strength, ductility or for cutting tools. It is entirely feasible to make castings which will run up to an ultimate strength of 130,000 lb. per sq. in., or to cast high-speed-steel milling cutters and reamers to form for grinding. The figures in Tables 2 and 3 show present-day comparative operating costs for liquid steel in the ladle under favorable conditions as in a steel foundry under 24-hr.-per-day operation.

TABLE 2 AVERAGE COST PER TON FOR TWO TONS OF CONVERTER STEEL DIVIDED INTO FOUR CUPOLA CHARGES

Two-ton Converter Charge	Cost per ton of liquid steel
Low-phosphorous pig iron	$14.09
Bessemer pig iron	7.89
Steel scrap	10.14
Silicon and spiegel	5.55
Coke, 863 lb.	1.01
Cost of material per ton of liquid steel	$38.68
Additions per ton of steel:	
10 lb. 80 per cent ferromanganese at 6 cents	$0.60
6 lb. 50 per cent ferrosilicon at 5 cents	0.30
2 lb. aluminum at 30 cents	0.60
Power for blower motors	1.25
Cost of materials and power per ton of liquid steel	$41.43
Average cost of cupola and converter linings	1.20
Labor costs	3.00
Cost of converter steel per net ton in ladle	$45.63

TABLE 3 AVERAGE COST PER TON FOR THREE-TON ACID-LINED, RAPID-TYPE, POLYPHASE, ELECTRIC FOUNDRY FURNACE STEEL

Three-ton Electric Furnace Charge	Cost per ton of liquid steel
Axle turnings (included above 3 per cent losses, 200 lb.)	$12.40
Mill scale (included above 60 per cent losses, 60 lb.)	0.09
Electrodes at 7 cents	1.40
1650 kw hr. (550 per ton) at cent per kw-hr.	5.50
Losses in melting 260 lb.:	
80 per cent ferromanganese	0.40
50 per cent ferrosilicon	0.25
Aluminum at 30 cents	0.15
Cost of material per ton of liquid steel	$20.19
Average cost of linings and roofs	0.40
Labor cost on furnace attendance	1.00
Cost of electric steel per net ton in ladle	$21.59

G. K. Elliott reports a cupola iron showing a transverse load of 2950 lb. with a 0.10-in. deflection in a standard arbitration test bar. After 25 min. treatment in the electric furnace, using 104 kw-hr. per ton, a similar bar was cast and broke at 4400 lb. with a 0.115-in. deflection.

Very fine results have been obtained with malleable iron made by treating cupola metal or by melting cold scrap in an electric furnace. The ability to refine for sulphur and phosphorus and to add ferroalloys to adjust the mixture to the proper malleabilizing formula, together with its very rapid operation, give the electric furnace a decided advantage in malleable-iron foundries, particularly in working on high-phosphorous southern irons.

In the non-ferrous-metal industry the electric furnace has shown remarkable economies, due to the saving of cost of crucibles and the greatly reduced metal losses caused by oxidation and volatilization. For such work special types of furnaces designed to avoid localized heating are necessary.

Selection of an Electric Furnace

As to the most suitable type of electric furnace for a given installation, if the scrap be inferior and high in sulphur and phosphorus, then the extra cost, slower operation, and shorter refractory life of the basic furnace must be endured to obtain the lower limits of sulphur and phosphorus not practicable to reach with the acid furnace using poorer grades of scrap. At present the call is for acid-lined furnaces, and cheap, good scrap is available in large quantities for foundries, and basic furnaces for alloy and tool steel. The acid furnace is simpler, cheaper and faster to operate and the steel casts more easily, while the basic furnace is essential for tool steels.

It is strongly recommended in any case that a furnace be so designed and constructed that it is adaptable to basic operation. This means that the furnace shell must be of large diameter and the bath of large area and shallow. The furnace should not, it is thought, be of the long-arc type, nor of the small-diameter, deep-bath type if the best and most rapid work is contemplated. Indeed, even for acid melting there is a noticeable difference in the quality of the steel obtained from the large-diameter, shallow-bath furnaces compared with that made in the deep bath-type furnace, for with the latter it is not feasible to obtain the same mechanical reactions from the additions put in to refine and kill the steel as when the bath is of the shallower type. Nor is it possible so thoroughly to deoxidize the metal by maintaining a reducing atmosphere in the furnace.

It is quite important that the furnace should operate at the highest practicable power factor that can be obtained without undue disturbance of the power company's load, for by so doing the electrode, transformer, line and generator losses are maintained at a minimum. Engineering skill of a high order is required to forecast and select the best type of equipment, under the many varied power-supply conditions which obtain in different localities.

By reason of the now generally acknowledged superior quality of the product, greater flexibility of operation, quicker, more-convenient-sized heats, and saving in alloys and in cost of melting stock, the electric furnace is rapidly coming to the front in the steel foundry and alloy- and tool-steel works wherever suitable power is available and progressive policies are in vogue. It is making possible the profitable operation of widely distributed small steel foundries to an extent not generally realized and greatly reducing the investment cost required in tool-steel works.

That weaknesses are developed in steel by aggregations of impurities, notably sulphur, which are forced into position in the processes of rolling or forging, is asserted in a paper by Mr. Portevin, published in *Comptes rendus des séances de L'Académie des Sciences,* for August 11, 1919. In the *Journal of the Iron and Steel Institute,* vol. 85, 1912, p. 379, Roger has outlined a method of applying an acid solution of silver bromide to uneven surfaces by using a plastic mixture of clay, wax and vaseline. Mr. Portevin examined the variation in the appearance of fractures in steel, test pieces, according to the direction of the line of fracture with respect to the fiber of the steel, given to it in the process of rolling or forging, by substituting for Roger's mixture a paste composed of gelatine, glycerine and water covered with an emulsion of silver bromide. Evidences of aggregations of sulphur were found in all specimens thus examined. It would appear, therefore, that the only means to prevent such aggregations is to keep the sulphur out of the ingot. This can be best effected in the opinion of Mr. Portevin by reducing the disengagement of gas in the pouring of the ingot and employing ingots of as small size as compatible with the use to which steel is to be put.

A Perfected High-Pressure Rotary Compressor

By CHESTER B. LORD,[1] ST. LOUIS, MO.

Of the three types of rotary compressors, namely, the centrifugal blower, the gear type and the eccentric rotor with telescopic blade, the last is the least efficient. Particulars are given by the author of a new and improved construction of this type in which leakage, friction and packing troubles have been eliminated to such an extent that a volumetric efficiency of 92 per cent at seven compressions (100 lb. per sq. in.) is said to be commercially obtainable. It is also stated that this compressor will, without adjustment or alteration, handle gas, air, or a liquid, or a gas and a liquid at the same time, and that it is possible to obtain a pressure of 500 lb. in a single-stage machine and 1000 lb. in three stages with the three units on the same shaft. The uses of the rotary compressor are also enumerated in the paper and its special advantages are set forth, these being (1) small weight per unit of capacity, (2) small amount of floor space required, (3) small initial cost of installation, (4) employment of direct drive, (5) small amount of headroom required, (6) simplification of construction and small amount of adjustment or repair, and (7) self-lubrication.

Any one familiar with the various lines of mechanical endeavor must realize that no vital change has been made in compressors in the last thirty years or more. There have been improvements in the way of better valves, a little higher speed and minor matters of this kind, but none of them has changed the principle of the machine or resulted in any great economy either in weight, operating space required, or cost of installation. Moreover, these machines require a great deal of attention, and necessary repairs are expensive because in almost every case the machines must be partly taken down in order to get at the parts to be repaired, the bearings are numerous and are lubricated with difficulty, and the valves must be adjusted in a very delicate manner to give best efficiency. Because of all these disadvantages in the reciprocating machine we are constantly striving to get on a unidirection basis in the mechanical world. We are replacing the reciprocating planer with a unidirection miller and introducing the uniflow principle in the reciprocating engine. The automotive world is searching for the unidirection gasoline unit, and the Patent Office records are full of rotary valves, rotary engines, and rotary pumps.

The rotary principle, however, is so valuable that in spite of their deficiencies three general types of rotary compressors have been retained, namely, the centrifugal blower, the gear-type compressor, and the eccentric rotor with a telescopic blade. The centrifugal blower depends more upon the velocity of the air than upon compression and requires several stages to secure any considerable degree of compression. The gear-type compressor which, roughly speaking, compress air between two gears with their teeth in mesh (taking it in at one side of the teeth and delivering it at the other) has a very low efficiency, but is able to compress to a higher degree, single-stage, than either of the other types. None of them, however, compresses to over 8 or 10 lb. single-stage.

The eccentric-rotor-with-telescopic-blade type of rotary compressor has been faulty in several respects. The first and greatest was that it was necessary to maintain a seal at one point between the rotor and the cylinder. This was a source of large friction losses and the seal was soon broken by wear. Second, the blade pressure against the end plates and the inner surface of the cylinder created great friction loss and still further wore the cylinder at the contact point between the rotor and the cylinder wall. Third, the pressure being all on one side of the blade created such friction that the blade did not work in and out freely. It was also found impossible to devise a method of packing square corners, and hence the only commercial application of this type was in the pumping of oil or water at a comparatively high velocity, which service produced the least friction and no important losses.

The New Rotary Compressor

As the result of long, patient research and the ingenious application of obvious principles, these faults enumerated have been eliminated and a new compressor perfected by W. G. E. Rolaff, of Belleville, Ill.

The difficulty of maintaining a seal at one point between the rotor and the cylinder is fundamental. Some years ago a Mr. Hermansen developed an engine in which the cylinder revolved at the same peripheral speed as the rotor and was, in fact, carried by the rotor. Having both moving parts traveling at the same peripheral speed, not at the *same angular* speed, means that there is no slip between the two, consequently, little or no friction. It also reduces to a minimum the blade friction against the outside of the cylinder because the movement of the blade on the wall of the cylinder per compressive revolution is only that represented by the difference in the circumferences of the outside of the rotor and the inside of the cylinder. In other words, in a 100-cu. ft. size with a cylinder 10⅝ in. in diameter and a rotor 10 in. in diameter, the blade travel per compressive revolution is only the difference between 31.41 in. and 33.38 in., or less than 2 in., so that it requires approximately 17 revolutions of the rotor for one revolution of the blade upon the cylinder wall. There are no valve openings in the cylinder, and as it travels always in the same plane it makes no difference whether the cylinder is revolving with the rotor, standing still or reversing itself, as far as compression is concerned. Hermansen's principle, by itself valueless, was evolved by Mr. Rolaff who at that time was unaware of the Hermansen patent which he afterward acquired.

The difficulty of excessive end pressure was overcome by floating plates at the ends of the cylinder held in intimate contact with the rotor by pressure generated by the machine itself. The pressure upon the outer surface of the plates is greater than upon the inner surface by reason of the difference of the area exposed to this pressure. This supplemental pressure is always in direct proportion to the pressure generated by the machine, hence the additional friction is only what is necessary to keep the cylinder heads in close contact with the rotor and cylinder ends, and where the pressure is even slightly greater on the outside than on the inside there can be no leakage. Any motion imparted to the rotor shaft will immediately be communicated to the cylinder by reason of the metal-to-metal contact between the two. In other words, if the rotor is revolved the cylinder will revolve with it and the cylinder plates will float with the cylinder or piston or between the two, as the case may be. The friction developed is merely the friction of the wiping contact between the rotor ends and the cylinder plates, since there is very little or no friction in the rolling contact between the rotor and the cylinder.

There still remained the question of packing square corners and of friction between the ends of the blades and the end plates. When the rotor is revolved, the piston blades which fit loosely in the slot fly out by centrifugal force and remain in contact with the cylinder wall and the cylinder heads, since centrifugal force acting on a wedge keeps them in such contact. This is the principal point of friction. But calculating this friction on the basis of speed in feet per minute, we find, for instance, that on a machine capable of compressing 100 cu. ft. of free air per min. the piston-blade travel is approximately ⅝ in., and since a machine of this type would run at about 900 r.p.m. we have the following calculation: $\frac{5}{8} \times 2 \times 900$, which gives 93 cu. ft. and since the surface in contact with the cylinder heads is very small, the total amount of friction generated by this reciprocating action of the piston blade is proportionately small.

For presentation at the Annual Meeting, New York, December 1919, of The American Society of Mechanical Engineers. The paper is here printed in abstract form, and advance copies of the complete paper may be obtained gratis upon application. All papers are subject to revision.

These blades as developed are of two types, centrifugal and pressure. At present, the centrifugal type shown in Fig. 1 is used commercially. This blade consists of four parts, one of which, *A*, is cut away as shown and on it are imposed three thin blades, *B* and *C*, of any desired metal. The two outside pieces *B* are beveled and the center piece *C* fits between these, forming a wedge, and the top of *C* is cut away to allow of movement vertically. Revolving at speed the center piece *C* is thrown out by centrifugal action, the force exerted on the pieces *B* being in the direction of the arrow. This presses the *B* pieces against the sides and ends of the cylinder. These blades are self-aligning and self-adjusting, also self-compensating. The force with which these blades *B* strike against the corners is regulated by the angle of their inner sides and the weight of the center piece. There are no springs whatever and the blade is balanced for back pressure by having both sides exposed to chamber pressure with a seat at the top of the slot in back, and as oil from the cylinder wall is scraped off by the blade into the slot, an effective seal is maintained. The blade *A* is about 1/32 in. short on each end and makes contact with the cylinder wall except at the extreme corner and side. The discharge valve is immediately in front of this blade. In machining the rotor and the cylinder where a rolling contact is maintained between the two, the turning of the cylinder too large or the rotor too small would destroy contact. For making contact, a circular wedge is used. This is an eccentric cradle carrying the bearings for the revolving cylinder and is made with a threaded stud led through the outer casing. In practice the rotor and cylinder are assembled without contact and

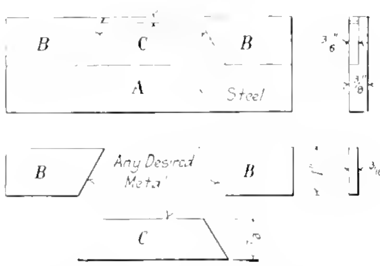

Fig. 1 Centrifugal Type of Blade for Use in Rotary Comressor with Eccentric Rotor

started on test. After a time, by drawing up on the wedge, the proper contact is made. When this is found, the nut is backed off about 1/4 turn, so that on a 500-cu. ft. compressor the space is about 0.01 in., the oil making a proper seal and contact. Capacity can be increased by taking a cut off the cylinder or rotor, or both.

One of the greatest advantages of the compressor is that it may be direct-connected. It can be run at any speed at which a prime mover can be run safely. A 100-ton refrigerating machine is run at 600 r.p.m., a 1-ton or 5-cu. ft. size at 1800 r.p.m. That the piston speed is not too high for efficiency is shown by data on a reciprocating compressor of 14-in. stroke and having 100 cu. ft. capacity at 200 r.p.m. The piston speed would be 466 ft. per min., or over 200 per cent in excess of a rotary compressor of the same capacity run at 900 r.p.m., with a relative speed of 150 ft. per min. between the rotor and cylinder. The next advantage is in its space requirements. A 100-ton rotary compressor on its base with its prime mover requires only 60 sq. ft. of floor space, whereas a horizontal reciprocating unit of the same capacity requires approximately 1200 sq. ft. plus a building, plus a boiler room, and weighs 100 lb. per ton capacity as against approximately 8 lb. for the rotary. It is usually possible to replace any pump or compressor with a machine weighing less than the flywheel of the displaced unit. With the high-pressure rotary compressor, the volumetric efficiency at 100 lb. pressure is 90 to 92 per cent, depending on size, as against 65 to 85 per cent with the reciprocating machine.

The rotary compressor without adjustment or alteration will pump gas, air, or liquid, or all three. When ammonia condenses in the coils of a refrigerating machine and a "slug" happens to get into the compressor, usually a valve or a cylinder head is blown off. A 5-gal. tank of oil can be poured into a rotary compressor running at full speed under load, as fast as the inlet pipe will take it. Since the end plates are held to the cylinder only by differential pressure, if the oil entering the cylinder cannot be discharged fast enough by the valves, the end plates open up, allow the oil to pass out and then close. It is obvious that when pumping fluid continuously the pressures inside and out would again be different and be relatively maintained, so that no leakage would occur. In other words, the loose end plates act as safety valves without effort, as any necessary area of exit is secured and the oil leaves the cylinder at just sufficient pressure to raise the end plates. This feature is valuable in pumping hot water, or gas and oil.

Another feature of this construction is the possibility of making the compressor double-acting by placing two blades 180 deg. apart, which would add 60 to 70 per cent to the capacity of the machine. Until recently, however, no effort has been made to do this as it requires an intake valve, which is troublesome. In the simple type no intake valve is used, the seal between the rotor and cylinder acting as such. The major trouble with all air compressors, reciprocating or otherwise, lies in the valves, and the same trouble was found initially in the rotary compressor. It was aggravated somewhat in the rotary by the fact that cracking or splitting of the valve in its cage was not immediately preceptible, and it was possible for a valve to gradually break up into fine pieces and get into the cylinder. Experiments were undertaken to find a suitable material, and this has been done for cases where the temperatures do not exceed 200 deg. fahr. In the 100-ton size the discharge valve is about 24 in. long by 1/2 in. wide, so it will be seen that the problem differs from that of the reciprocating machine.

Uses of the Rotary Compressor

The uses of the rotary compressor include every one possible to a compressor of the reciprocating type and some that are not. It is possible to get 500 lb. pressure single-stage; to get 1000 lb. pressure in three stages with the three units on the same shaft; to make it a low-pressure machine, giving it any desired capacity by making the rotor relatively small; and to give even more than 1000 lb. pressure single-stage by reducing the displacement. As a vacuum pump it will pull 28 1/2 in. against a pressure of 180 lb., but to do this continuously with a compressor it is necessary to shut off the oil pipe, and for commercial practice it would be necessary to have a self-contained oiling system. The firm handling the rotary compressor in question has already been asked to consider the making of blowing engines for blast furnaces, as compressors of the rotary type do not take up more than 5 per cent of the room now necessary.

These rotary compressors are in use at the present time as boosters on refrigerating units for both high and low pressures. The small household refrigerating business has not grown because it had been found impossible to secure a dependable compressor. One manufacturer is at present building units using this rotary compressor. It is a 0.5-cu. ft. size, runs at 1760 r.p.m., is direct-connected and is perceptibly noiseless, as are all other sizes of this compressor. The rotor in this size is 1 7/8 in. in diameter and 1 in. long. Another manufacturer is making the 3-ton refrigerating size. Still another has a contract on which is guaranteed a minimum of 10,000 cu. ft. per year for street-car compressors. Another use is as a small individual unit for refrigerating cars, run either from the axle direct, or with a motor from a turbine in the engine. Upon arrival at terminals, instead of the expense and waste of icing, it will only be necessary to plug in.

Used as an air compressor, the rotary compressor is ideal as the air is taken off at the center and the oil thrown out centrifugally to the periphery. No rotary pump is at present made that will prime itself, but this is not true of the compressor when used as a pump. Further, although no reciprocating pump manufactured handles CO_2 successfully for any length of time without need of repairs because of the high efficiency and the character of its cylinder construction, there would seem to be little doubt of the rotary's ability to handle CO_2 continuously without repairs. This is in the future and also applies to hydraulic applications.

Common Errors in Machining of Bearings

By CHRISTOPHER H. BIERBAUM,[1] BUFFALO, N. Y.

The machining of bearings is a subject which has received but slight attention, and this despite the fact that it is an important one. To place on record some of the more common errors prevalent in this type of work, the author in his paper discusses the disadvantages of tight-fitting bushings, the methods of finishing brasses to provide for expansion while running, and the methods of clamping bearings during tooling. He also takes up the matter of the tools employed and shows by numerous photomicrographs of finished surfaces the importance of using sharp tools with the proper rake, in order that the crystalline structure of the surface material of the bearing may not be so crushed that it will fail to function as a normal bearing alloy.

IN the construction of journal bearings one matter which is very frequently neglected, perhaps most often because it is not thoroughly understood, is that of driving in bushings. As all bearing alloys have a temperature coefficient of expansion higher than that of cast iron, and as the bearing is directly subject to the friction of the journal, it follows that the bearing is at a higher temperature than the cast-iron housing and that all bearings must have an appreciable outward expansion when in operation. For this reason bushings should be driven in with just enough pressure to prevent looseness during operation.

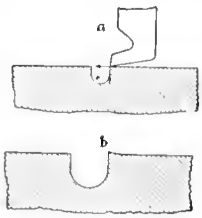

Fig. 1 Sharp Edge Produced at the Edge of an Oil Groove by an Ordinary Lathe Tool

The practice of driving in bushings so tight that they require reaming before they can be put into service cannot be condemned too severely. The subsequent reaming does not remedy the evil, in that a bushing driven in so tight will and must continue to contract inwardly when in operation, since the outside pressure upon it is not removed by the reaming. In the tooling of a bearing a definite amount of clearance should be provided for, in order to insure the best service conditions. When a bushing is driven in too tight, although it has been reamed before being placed in service, the amount of clearance which it will then have becomes a matter of guesswork and the amount of oil-film space provided an uncertainty. This condition frequently gives rise to heating and bearing troubles, even though the amount of internal contraction may not be sufficient to positively grip or stop the journal. The idea that bushings must be driven in tightly in order to hold them in place is fundamentally wrong, and excessive tightness of the bushing in its housing should always be avoided. For all ordinary machinery it will suffice if a bushing may be driven in place with a blow of the hand or with a small block of wood. The provision of fastening the bushing in place should be such that it will not bind or clamp the latter against outward expansion.

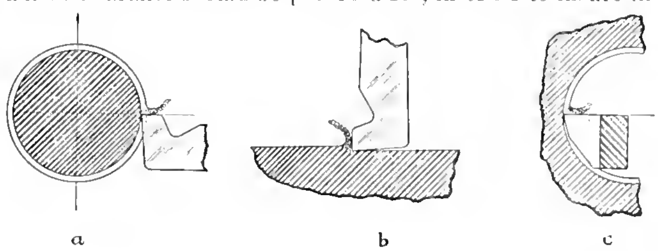

Fig. 2 Improper Forms of Lathe, Planer and Boring Tools

Method of Finishing a Crankpin Bearing

The finishing of bearings in such a manner that they may expand while warming up is of very considerable importance, and this can be done in many cases by simply giving the matter the full consideration which it deserves. The two edges of the two half-bearings should be "brass bound," that is, they should bear solidly against each other and should exert a pressure against each other somewhat in excess of the maximum crankpin load. The outer surfaces of both bearings near these edges should be relieved so as not to bear upon the straps. The four corners of the bearings should be relieved in like manner so that the horizontal thrust will be mainly borne upon the surfaces falling within the area of the horizontal projection of the crankpin. A bearing thus constructed expands with the first slight increase of temperature, relieving the crankpin instead of clamping it as when these precautions are not taken.

Clamping of Bearings for Tooling

Another matter very often overlooked is that of the manner in which bushings or bearings in general are clamped during tooling. With a 5/8-in. 16-thread set screw and the application of, say, a 50-lb. pull upon a 12-in. monkey wrench, a pressure of 50,000 lb. can be carelessly exerted upon the bushing in question, and it must be remembered that the composition of a bearing material is never one that would be selected for maximum strength. Bushings tooled when clamped in this manner seldom have a bore that even approaches a true cylindrical surface, and if they are then driven upon an arbor and finished on the outside a very inaccurate product is the result, a bushing that can never give the most satisfactory service. The best and most satisfactory method of holding bushings for tooling is that of clamping them endwise. The importance of this is very generally underestimated; in general, bearings should be held in a manner such as to produce the least possible amount of strain and distortion.

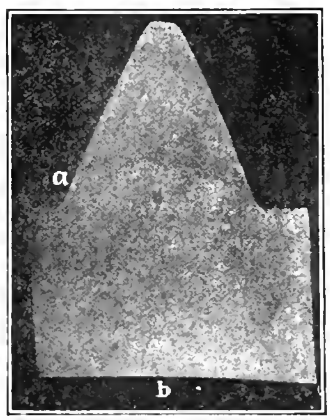

Fig. 3 Cross-Section of One of the Teeth of a Motor-Truck-Drive Worm Wheel

Chamfering of Oil Grooves Edges

The matter of chamfering oil-groove edges deserves special attention in that all advance edges of a bearing should be rounded and chamfered off, and the fact that this work should be done last, after all of the other tooling of the bearing has been completed, is important. At *a* in Fig. 1 is shown an ordinary lathe tool at the edge of a groove on a finished surface. It is obvious that there are being exerted two forces upon any surface which is being tooled,

one horizontal or parallel to the finished surface and the other vertical or in a direction normal to that surface. The resultant of these two forces is a force indicated by the dotted arrow, in a direction tending to deflect the edge of the groove obliquely downward; producing an effect which is shown somewhat exaggerated at *b*, Fig. 1. It can readily be appreciated what an injurious effect is produced in a bearing if any tooling is done after the oil grooves have been cut, especially so if the direction of rotation of the journal is opposite to that of the tooling. In all cases sharp edges of the groove prevent the formation of an adequate oil film and should be carefully avoided.

FIG. 4 PHOTOMICROGRAPH OF FIELD AT *a*, FIG. 3 (60 MAGNIFICATIONS), SHOWING DISTURBANCE OF CRYSTALLINE STRUCTURE DUE TO THE USE OF A DULL HOB IN TOOLING

WHY BEARING SURFACES SHOULD BE MACHINED WITH SHARP TOOLS

For best results it is very necessary and it is also general practice that a cutting tool should have rake. The tools shown in Fig. 2 would be readily condemned even by a person with a very limited shop experience, and no journeyman machinist would think of setting a lathe tool as shown at *a*, a planer tool as at *b*, or a boring tool as at *c*. In the case of the latter, the amount of normal or radial pressure which it exerts upon the finished surfaces is far in excess of what is necessary. Consider now the standard multiple-cutting-edge reamer which is very often used in finishing bearings. A 2½-in. reamer would have, say, 14 edges and the amount of bursting or internal pressure that it would exert within a bushing would be at least 14 times that exerted in case the bushing were reamed with only one improper tool as shown at *c*, Fig. 2. This practice is one that cannot be condemned too severely.

The final finishing in bearings should be done by reamers or cutting heads having only one or a very limited number of cutting edges, and these cuting edges should have the proper amount of rake, such as would be given to any other proper cutting tool. Experiments made in a large manufacturing plant on bushings of the same dimensions, from the same lot of material, finished at the same time (some, however, being reamed with the standard multiple-cutting-edge reamer and others with a single cutting blade) showed that after a storage of six months those bushings which had been reamed with a proper single cutting edge retained their accuracy and shape much better than those finished with the so-called standard reamer. The latter bushings exhibited a decided tendency to decrease in inside diameter and to assume inaccurate elliptical forms. It was also brought out at this time, that not only did a superior product result from the use of a proper tool, but that by its use the production could be increased from 15 to 20 per cent.

DEFECTS IN BEARING SURFACES REVEALED BY THE MICROSCOPE

Another reason why bearing surfaces should be tooled with sharp tools having the proper amount of rake is brought out by a microscopic study of bearing surfaces. In order to obtain the full value of bearing alloys it is necessary that these alloys should be presented as bearing surfaces having their natural crystallization undisturbed. The reason for this is given in the report of the Society's Research Sub-Committee on Bearing Metals.[1] The hard or bearing crystals should be embedded in a softer material, permitting the former to adapt themselves to the journal surface; the softer crystals under proper service conditions will wear slightly below the surface of the harder crystals. In order to retain these conditions it is necessary to preserve the natural crystallization upon the bearing surfaces, but this cannot obtain where they have been mutilated by improper tooling. This mutilation of the bearing surfaces gives rise to the crushing of the harder crystals and embeds these crushed particles into a compressed material which does not function as a normal bearing alloy.

A very forcible illustration of this is furnished by the bronze worm wheel of a certain motor-truck drive in which the teeth had been finished with a dull hob, Fig. 3, showing a cross-section of one of the teeth. After giving unsatisfactory service the worm wheel was examined in the usual way by chemical and physical tests, neither of which showed any defect whatsoever. On the other hand microscopic examination showed that the trouble was due to improper tooling. Fig. 4 shows a photomicrographic section of a field at *a* in Fig. 3. This view clearly shows that the natural crystallization of the greater part of the area has been disturbed, and that the edge of the tooth has had a cold-rolled or wire-drawn effect produced upon it by improper tooling. It is true this effect is not very deep, nevertheless it is the very surface which is brought into play when the worm wheel is put in operation. Fig. 5 shows a part of Fig. 4 more highly magnified, in which the cold-rolled effect upon the surface is seen to be even more complete, a condi-

Kerosene as a Fuel in High-Speed Engines

By LAWRENCE F. SEATON,[1] LINCOLN, NEB.

Although considerable work has been done toward the use of kerosene as a fuel for internal-combustion engines, there still exists a controversy regarding the correct design of a vaporizing system, and very little work has been done toward determining the distribution of the heat evolved by the fuel. To study these problems the author made a series of tests on a high-speed heavy-duty type of engine using kerosene as a fuel. These tests form the basis of the paper, and the apparatus used and the manner of conducting the tests, are discussed in detail.

At the present time there is a great deal of controversy among the designers of high-speed gas engines regarding the correct design of a vaporizing system to successfully handle kerosene. There has also been very little done in regard to determining the distribution of the heat of the fuel, which is used in high-speed engines. Another idea, which is likewise much disputed, is the effect on the crankcase oil, due to particles of unvaporized fuel passing by the pistons and entering the crankcase, and it was therefore decided to fit up a high-speed engine in such a way that the foregoing conditions could be carefully and accurately studied.

Description of Apparatus

The apparatus used, and upon which these tests were conducted, is shown in Fig. 1. The motor which was tested was a $4\frac{1}{2} \times 5\frac{1}{2}$-in. high-speed, heavy-duty type and was equipped with a Kingston carburetor connected to a specially designed vaporizer. The exhaust gases were piped directly from the exhaust manifold to the calorimeter. There was also provided a bypass pipe from the top of the exhaust manifold through the vaporizer and back to the calorimeter, and by means of dampers any amount of the exhaust gas could be sent through the bypass making it thus possible to maintain any desired temperature in the vaporizer. Pyrometers were placed both in the bypass and in the main-line exhaust pipes. A thermometer was placed in the intake manifold leading to the motor block. The air leading to the carburetor was maintained at a constant temperature, by means of an electric heater. A manometer was connected to the intake opening into the carburetor, and in this way the suction pressure was measured.

Two Tabor engine indicators were used, one fitted with a 240-lb. spring for measuring the average combustion pressure, and the other with an 80-lb. spring for determining the compression pressure. A Dixie high-tension magneto provided with a starting coupling was used throughout the tests for ignition. A valve was placed in the bottom of the crankcase through which the oil could easily be drained in order that its temperature, gravity and weight might be accurately determined. A water-spray nozzle was located in the intake manifold in order that water might be introduced at high loads to prevent preignition.

The weighing system for the cooling water consisted of two large tanks and a scale, and the water was weighed every fifteen minutes. The fuel was weighed on a specially designed scale connected with a beam-bell contact, which thus made accurate readings possible. Fuel was piped from the fuel drum up to the kerosene tank, the drum being so arranged that air pressure could be used to force the fuel through the pipe into the tank on the scale. At high loads it was necessary to fill the tank between readings, and it was therefore necessary to correct only for the time which it took to fill the tank.

The calorimeter used consisted of a Wheeler surface condenser, the water passing through the tubes and the exhaust gas entering the shell. The exhaust gas thus coming in contact with the cold tubes was brought down to room temperature. Since the products of combustion were condensed in this apparatus, it was necessary to have a valve placed at the point where the gases entered the calorimeter and also one in the large handhole plate. By means of these it was possible to determine the amount of liquid condensed during each run. A gasoline tank, mounted on the side of the dynamometer, was used for starting purposes. A thermometer well was placed in the bypass line near the vaporizer so that the temperatures might be compared with those shown by the pyrometer, also placed in the bypass line.

The load carried by the engine was maintained by means of a Sprague electric dynamometer, and the load was so constant from this source that no governor was used on the engine. It was possible, therefore, to study the force of explosions under constant throttle opening. A water manometer was placed on the exhaust line to determine the back pressure at a point just before entering the calorimeter.

Manner of Conducting Test

The engine was started and brought up to a speed of 1100 r.p.m., the speed recommended by the makers, by means of a load connected to a throttle butterfly valve. The load was then put on the

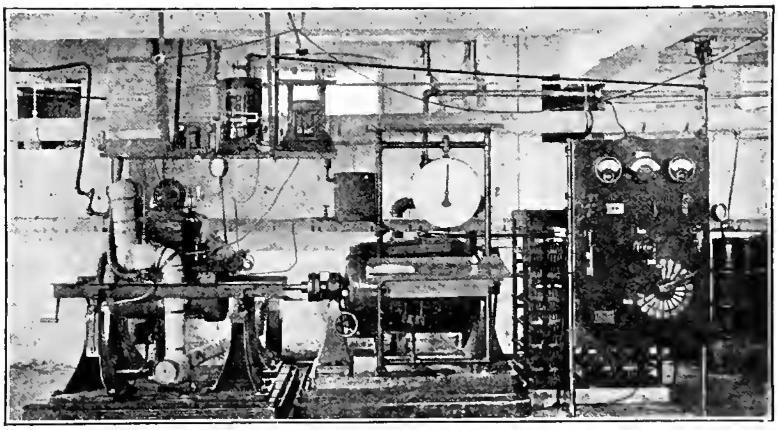

Fig. 1 Apparatus Used in Conducting the Tests

engine by means of the dynamometer. A series of tests was first run with various temperatures in the vaporizer, air entering the carburetor at a constant temperature. The temperature of the intake air was maintained at 115 deg. fahr. and the temperature around the vaporizer was increased from an initial 150-deg. by 100-deg. increments until a temperature of 650 deg. was maintained on the bypass pyrometer. This corresponds to a temperature of 785 deg. in the vaporizer, and in order to obtain this condition it was necessary to shunt all the gases through the bypass at low loads. The loads carried under this condition were approximately 5, 10, 15 and 20 hp. The length of test run on each load was two hours. These series of tests are known as tests 1, 2, 3, 4, 5 and 6, and the average results of tests 1, 3 and 5 for loads of 0, 5, 10 and 20 hp. are given in Table 1, which will be found in the complete paper.

Tests were also made increasing the temperature of the intake air by increments of 10 deg.; that is, the first test was run maintaining a temperature of 650 deg. on the bypass pyrometer and 125 deg. on the intake air. This test is known as E-1. The next test, with a constant temperature in the vaporizer, and another

10-deg. rise in the intake air, is known as test E-2. This process was continued until a maximum was obtained at which it was thought practicable to run the engine, according to both the amount of power obtained from the engine and to the fuel consumption per hp. The average result of these tests will also be found in Table 1 of the complete paper.

At the end of the series of E tests, which was thought to cover all conditions commonly met in practice, it was decided to run a test in which the limit of the apparatus was reached as far as furnishing heat to the mixture was concerned. This test is known as Test F. All heat from the exhaust gases was thrown through the vaporizer and all possible current was passed through the heating coils in the air-heater. Indicator cards were taken at 15-min. intervals in order that the combustion pressure might be ascertained and also to determine the evenness with which the fuel was burning in the cylinder. The indicator drum was not connected to the engine but simply turned by hand, leaving the indicator cock open. The pressure of successive explosions was clearly shown at the end of each test,

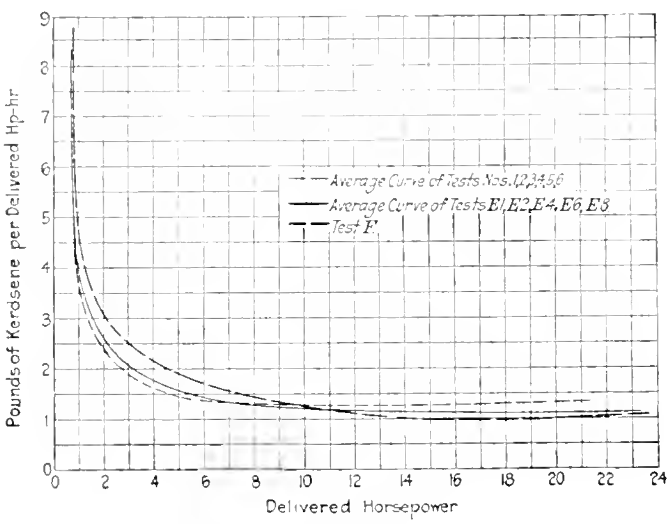

FIG. 2 CURVES OF DELIVERED HORSEPOWER VS. POUNDS OF FUEL

when the spark plug was short-circuited and a light spring used to determine the compression pressure. The oil was cleaned out of the crankcase at the end of each run, when the temperature, gravity and weight were determined. This was done in order that some definite information might be obtained as to the effect of kerosene on the lubricating oil, especially when run without sufficient heat to more or less perfectly vaporize the fuel.

RESULTS OF TESTS

From the summary of results and from the curves plotted between delivered hp. and lb. of kerosene per hp-hr., as shown in Fig. 2, it will be seen that the thermal efficiency of the engine was practically constant throughout all heat changes made as previously described. It will be observed, however, that the motor became much more flexible, especially when the temperature of the ingoing air was raised, as this in turn raised the temperature of the ingoing gas materially, much more, in fact, than was possible by increasing the temperature in the vaporizer, for the reason that a small area was exposed to the hot gases in the vaporizer. It was found that at low heats the motor would not idle down below 800 or 900 r.p.m. At the exceptionally high temperatures of the ingoing gases—about 375 deg.—it was found that the engine could be idled down to 150 r.p.m., and would pick up almost as well as when burning gasoline, and that the engine could be started on kerosene.

Since the fuel-consumption curves shown in Fig. 2 are practically identical throughout the conditions covered in these tests, it seems probable that about the same percentage of the fuel was burned in the cylinders under all the conditions covered in the test. This is also substantiated by the fact that the amount of kerosene deposited in the crankcase was practically constant for all conditions. The only advantage in heating the ingoing air and gas was that it made the motor more flexible. In fact, when the engine was kept up to speed it was found that a greater horsepower could be developed when a low temperature of gas was taken into the cylinders. It seemed quite evident that during all these tests a wet mixture was taken into the cylinders, and that in no case was the kerosene thoroughly vaporized before entering.

It was also observed that at any time during the test of higher heat conditions the engine could be made to preignite by lowering the temperature of the air entering the carburetor. A reasonable explanation of this seems to be that in the cracking process of the fuel a gas is formed which is quite explosive, and that when the conditions are slightly changed this explosive gas is not formed, which does away with preignition: it being fair to assume that this explosive gas, which probably is acetylene, is ignited instantly by the spark which in ordinary practice occurs several degrees before dead center.

The curves of Fig. 3 represent a typical heat distribution throughout the motor, and it will be observed that the maximum thermal efficiency is about thirteen per cent. The percentage of heat going to the cooling water slightly decreases after the load increases; while the percentage of heat to the exhaust gases increases after the load increases. It will also be observed that the

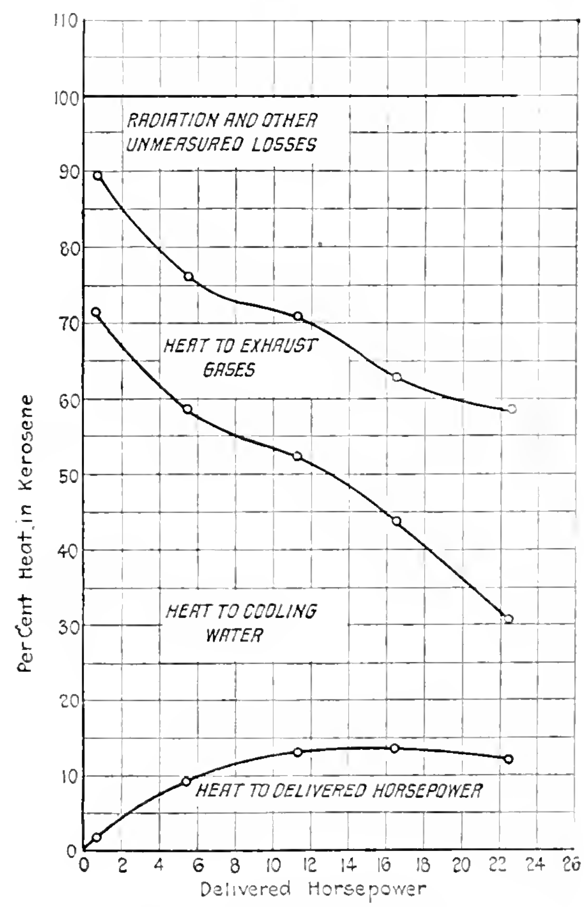

FIG. 3 A TYPICAL HEAT BALANCE

percentage of heat dissipated through radiation and other unmeasured losses, which includes the amount of fuel deposited in the crankcase, increases as the load increases. This, no doubt, accounts for the increase of unmeasured losses as the load increases.

It is the belief of the writer that a motor designed as follows would handle kerosene at all loads successfully: The piston displacement should be greater per horsepower than that commonly used, a higher compression pressure should be obtained, the intake passages should be large and short, and the intake gas should be heated to a temperature considerably above the boiling point of kerosene. This probably would be done with the exhaust gases, necessitating an automatic temperature control at all loads.

Oil Pipe Lines

By S. A. Sulentic,[1] Eldorado, Kan.

In this paper the author compares the cost of pipe-line transportation with that of rail and canal and shows the advantages of the oil engine as a means of economically transporting oil for long distances through pipes. He also derives simple formulae for calculating the pressure, net horsepower and brake horsepower necessary for the transmission of any quantity of oil per day through a pipe of known diameter.

The cheapest method of overland transportation of oil is by pipe line. The cost in comparison to rail transportation is low, and yet when the rail cost is based on every-day practices, the amount seems very small. For instance, the management of an eastern railway, wishing to impress upon its clerical employees the importance of economy, posted the following notice: "For every lead pencil you waste we have to haul one ton of freight one mile." The cost of a pencil has always been regarded as being insignificant, but when it is considered that it is equivalent to the cost of the above-mentioned haul, a similar comparison with pipe-line transportation should be interesting. The carrying of one ton of freight for one mile at the cost of a lead pencil is very cheap transportation, one or two cents per ton-mile being a low rate. Canal transportation, after allowing for the proper fixed and maintenance charges, may be lower than the rail charges by 60 per cent or more. Five or six cents per mile is not an uncommon charge.

In order to make a very crude estimate of the cost of transporting oil by pipe line when using equipment of the highest economy, assume a single line operating under the following conditions at a load factor of 80 per cent for 300 days per year:

Size of line	8 in.
Length of line	33 miles
Pressure in line	700 lb. per sq. in.
Rate of discharge	900 bbl. per hr.

At this rate the discharge would be 21,600 bbl. per day or 6,480,000 bbl. per year of 300 days. Assuming 6.5 bbl. per ton, the yearly discharge would approximate 1,000,000 tons. The work equivalent of this discharge would be 33,000,000 ton-miles, calling for the continuous expenditure of 257 hp. Assuming the mechanical efficiency of the engine to be 75 per cent, the actual horsepower necessary to install would be 342.

The assumed costs would be as follows:

Line: 33 miles at \$1.65 per ft.	\$287,500
Right of way at \$0.25 per rod	2,640
Freight: 79 cars at \$250	19,750
Haulage: 900 tons at \$14.50	13,050
Laying pipe at \$0.075 per ft.	13,060
Burying pipe at \$0.20 per ft.	34,850
Engines, pumps, installed accessories	68,500
Pump stations, buildings and foundations	30,000
Tanks { 2 — 55,000-bbl. at \$18,500 each	37,000
Tanks { 2 — 500-bbl. at \$500 each	1,000
Telegraph line: 33 miles at \$550	18,150
Superintendence	2,500
Incidentals	6,000
Total	\$534,000

The operating expense, including fixed charges based on the total assumed costs, would be as follows:

Interest at 6 per cent	\$32,040
Depreciation at 5 per cent	26,700
Administration	10,000
Attendance at pump stations and lines	11,500
Repairs to equipment, lines, etc.	4,000
Fuel for pumping — 3000 bbl. at \$2.65	7,950
Total	\$92,190

[1] Supv. Eng. Empire Gas and Fuel Company. Mem. Am. Soc. M. E.

For presentation at the Annual Meeting, New York, December 1919, of The American Society of Mechanical Engineers. The paper is here printed in abstract form and advance copies of the complete paper may be obtained gratis upon application. All papers are subject to revision.

The cost of operation per ton-mile under the assumed conditions would therefore be: 92,190 ÷ 33,000,000 = \$0.0028. And as the relation between the cost of pipe-line transportation and rail transportation is in the ratio of 1 to 10, it is easily seen that the waste of a lead pencil in a pipe-line enterprise would be the equivalent of the cost of transporting 10 tons of oil one mile.

It should be noted, however, that almost all of the pipe-line costs are fixed and are mainly independent of the amount of oil pumped. As a result, the transportation cost per ton-mile will vary almost inversely with the load factor of the line. If this hypothetical pipe line should be operated only one-tenth of the time assumed, the unit transportation cost would equal the rail cost. Furthermore, these figures are based on a life of 20 years (5 per cent amortization). A railroad would probably be used for various classes of freight as long as it existed, but a pipe line is of service only as long as oil is presented for transportation. If the pipe line in question were to become obsolete in ten years through the exhaustion of the oil fields or other causes, the ton-mile cost would be greatly increased.

In this connection it may be of interest to give a few figures and examples showing the relations existing between pressure, capacity, diameter, length of line and power required.

Disregarding viscosity, the general hydraulic formula for friction head in a pipe discharging an uniform volume is

$$F = k\frac{v^2L}{2gD} \qquad [1]$$

in which

F = friction head in feet of water, lb. per sq. in. ÷ 0.433
k = friction coefficient for 38 gravity oil = 0.024
v = velocity of flow, ft. per sec.
g = acceleration of gravity = 32.2 ft. per sec.^{2}
L = length of line, ft.
D = diameter of line, ft.

The formula for pressure in the line may be stated as

$$P = 0.433\,k\frac{v^2L}{2gD} \qquad [2]$$

in which P = pressure in line in lb. per sq. in.

The discharge Q of the line, cu. ft, per sec. can be easily derived and stated as

$$Q = \pi\frac{D^2v}{4} \qquad [3]$$

in which Q varies directly as v. Since P varies directly as v^2 in Formula [2] and Q varies directly as v in Formula [3], it follows that P varies directly as Q^2.

The net horsepower required for a pipe line may be most readily calculated if we note that the pressure per square foot is equal to the number of foot-pounds required to displace 1 cu. ft. of oil, or

$$\text{Hp.} = \frac{144\,PQ}{550} \qquad [4]$$

For 1000 bbl. per day against a pressure of 1000 lb. per sq. in., the net hp. necesary by Formula [4] would be

$$\text{Hp.} = \frac{144 \times 1000}{550} \times \frac{1000 \times 5.61}{24 \times 60 \times 60} = 17$$

where 5.61 = cu. ft. per bbl.

Assuming a pump efficiency of 85 per cent, the horsepower of the engine would be 20. Here we have a very simple rule for calculating the horsepower from bbl. per day and pressure in lb. per sq. in.; namely,

(*Continued on page 914*)

Industrial Unrest

Problems Relating to Present Industrial Conditions Discussed by Two Leading Authorities on Economics and Sociology

Industrial Unrest has been the subject of two addresses recently delivered before the New York Section of The American Society of Mechanical Engineers. On the evening of September 17, Dr. William M. Leiserson, formerly Chief, Division of Labor Administration, Working Conditions Service, U. S. Department of Labor, outlined the history of industrial unrest, and in the course of his address described the various classes of strikes. At a meeting on October 9, Dr. Henry R. Seager, professor of political economy at Columbia University, discussed the subject more especially from the viewpoint of the employee. Summaries of the two papers follow.

INDUSTRIAL UNREST

By DR. WILLIAM M. LEISERSON

THE industrial unrest of today may be better understood by a study of the important facts concerning its growth. The labor problem is more than an industrial and economic problem, it is a social and political problem. We should not isolate such questions as strikes, production, closed shop, collective bargaining, unrest and Bolshevism, but should study the background and history of the labor problem, the character of the people that are restless, the different problems of industry from every point of view and obtain, if possible, a bird's-eye view of the whole problem, from the time when industrial unrest first began to appear to the present day.

The labor problem is a problem of controlling our great masses of individuals to a common purpose. It has always been argued that the mass is too ignorant to be capable of rising to a higher level. This principle was followed in the early centuries when society was held together by religious leaders who issued the orders of the priests and popes to the common mass. But however ignorant the majority may have been, there were some who rose out of the mass with a new purpose and led them to religious democracy.

Political democracy was the next big question. Kings and nobles and people with political power issued laws and orders through established forms. The ordinary common man was not expected to know anything about government. But here again, contrary to the expectations of those on the higher level, the mass rose, demanded some share in the government and won the right to vote.

"And now," to quote Dr. Leiserson, "that great mass of rank and file insists, 'We must have a say in the government, in the management of the industries in which we spend our lives.' You can say from now until doomsday that they don't know anything about industry. Well, they didn't know anything about government or religion. Certainly they knew very much less about government and religion than they know about industry, because they, at least, work in industry. And they now insist on a voice in the management of industry."

We can no longer argue that the mass is ignorant. The group of people who have held that the common people will always remain where they are is gradually giving way to two other groups; one of these believes that unless the whole mass rise at once the problem cannot be solved; the other group sees what is really happening, the gradual rise, stratum by stratum, of the working people. Dr. Leiserson illustrated this by referring to the rise and fall of prices.

"In the United States this industrial situation that you have today has repeated itself at least half a dozen times — the same sort of unrest, the same sort of thought that we are having now. We have had periods in the history of the country when proportionately we had more strikes than we have today. At every period of rising prices in the history of this country there have been great numbers of strikes, great numbers of rebellious movements among working people. In the History of Labor in the United States by Professor Tolman you will find a chart which really represents the backbone of the industrial question. It shows our prices rising, falling; rising, falling; rising, falling. And about 1819 there was a period of rising prices, and our first real labor movement began then. From 1827 to 1837 we had a very remarkable rise in prices. You remember that was the time of the wild-cat banks: and during that time we had a national labor organization in this country, back in 1837, and proportionately at that time there were probably as many union men, as many organized labor unions, in 1837, to the number of wage earners, as there are now. And particularly from 1835 to 1837, you had this remarkable number of strikes, and you had a workman's party at that time. And then from 1837 down to almost 1850 we had one of the longest industrial depressions that this country has ever known. The bottom seemed to have fallen out of society. And you had very little in the way of a labor movement at that time. From 1850 to 1855 prices went up again. In came the labor movement again, union. Then the slavery question knocked everything out, and the war came on, and prices went up, and you had labor unions and strikes and wage earners trying to get control of industry just the same as today; and after 1870 there was again a period of depression; and today this enormous rise in prices, in cost of living, is what is causing all your trouble, just the same as it did before."

Dr. Leiserson went on to analyze this situation. A rise in the cost of living affects the standard of living of the workingman. Then comes danger, not from the very poor, those on the starvation line, who have nothing to lose, but from those somewhat higher up, who have gotten used to a higher standard of living and do not want to give up what they have gained. During times of falling prices there is a great deal of talk of socialism or communism, such as the great socialistic movement from 1837 to 1842. But when prices are rising the workmen say, "Our standard of living is threatened and we must have more." This, it would seem, is the opportune time for the wage earner to improve his condition.

The character of these movements of the working people to better their conditions, to get a larger share in the products of industry, depends upon the character of the people who are the wage earners. Pure Americans made one kind of demands, Irish- and German-Americans another, and today Polish and Jewish and Italian and other European elements are making a different kind of a demand, and the problems are different. The first labor unrest in this country, for instance, was a political question. The situation was similar to that of today, except that the chief demand of the workmen in 1837 was the right of unpropertied people to vote. Later, after the Civil War, wage earners fought against the introduction of machinery. Then employers brought rural Americans into the cities rather than grant the demands of the organizing workmen. These, in turn, organized and employers brought in immigrants to take their places. And now it is this foreign element, introduced at the time of the great strike in Homestead, in 1882, and a big steel strike in the 90's, that is organized and striking that it may maintain the standard of living which it has adopted in America.

Keeping this general history of the labor problem in mind, it is possible to analyze the strikes which are a result of the industrial unrest of today. Their character is more important than their number.

The largest number of strikes, numerically, are unorganized

strikes. The strikers are unorganized bands of dissatisfied working people. In a typical strike of this class, the majority of the strikers were foreign born, ignorant and dissatisfied with their wages. The firm had no dealings with unions and professed to be of the open-shop type. But it had kept its employees in ignorance as to how to express their grievances. Without any organization or financial support, without any definitely formed demands, they revolted. They could not obtain the support of a union because they were not organized, and for the same reason their demands, later presented to the firm through a committee led by a young foreigner, were rejected. The strike gradually died out, the employees losing their immediate demands but gaining a knowledge of the value of organization.

The second type of unorganized strike is that of people never organized before, but just coming into an organization, the strike of federal employees, of teachers, of policemen, of firemen, etc. Their demand is the usual one; they want sufficient wages to maintain their standard of living. But have these people, who have obligations to the public, the right to organize and to strike? Should they affiliate with the American Federation of Labor? On this subject Dr. Leiserson said: "Personally I think the public is not ready to let them affiliate with the American Federation of Labor. But I think the public is wrong. It is exactly the same situation as when the people who were serving in the armies of the king said, 'We want the right to vote, to elect members of Parliament,' and so forth, and they said, 'For heaven's sake if you can vote, why, you would control the army, and you are the fellows that serve in the army.' But we fought it out. We vote. People who serve in the army vote and control the army. People who work for the Government vote. Society is not broken up on account of it, is it? Why? Because we are reasonable human beings. A union is not organized to strike. A union is organized to deal collectively with the employer, whether it be public or private, and if the employer will deal with it, why, there needn't be any strike. It is just a question of talking with the men, and conferring, and when they cannot agree, to put it up to an arbitration of some kind. We do it on the railroads. We do it in other industries. We do it in an industry with which I happen to be connected now, the clothing industry, where the employees agreed not to strike provided the employer will hear their case, and provided, further, that if they cannot agree, there will be a judge to decide who is right."

There is a third kind of unorganized strike which is just appearing, that of the clerical employees. The rising cost of living is also threatening their standard of living, and the time is not far distant when their growing dissatisfaction will result in organization and strikes.

On the other hand we have the organized strikes, guided by trade unions. The members of these unions are skilled workmen, men who have been organized for some time, and have very definite ideas of what they want. The American Federation of Labor has not organized the immigrant class which is found in many industries, but in the packing and steel industries it has been steadily working toward organization. In the packing industries a mediator was appointed by the War Department during the war, and difficulties are adjusted through him. In the steel industry, however, the corporations would have no dealings with unions. During the war they handled the situation by paying such high wages for overtime that there were no strikes. Now the American Federation of Labor has organized the employees of the steel industry, both foreigners and American, and because the corporation still holds to its position, a strike is imminent.

The main point of difference is this: The employees, through the union, want collective bargaining. The corporations avoid the issue by professing to want the open shop, which is not, as they conduct it, a fair partnership. Their statement is this: "If any man who has a grievance will come to us and tell us about it, we will fix it up; and if we don't, he is perfectly free to go somewhere else." They give the employee the choice of the little piece or none. When the corporation finds that the open-shop method is dangerous to its interests it declares the closed shop. It will not deal with unions, but when its own methods fails it is quick to adopt the tactics of the union. It also attempts to avoid collective bargaining by maintaining that the members of the unions and the employees who strike are not Americans, but are ignorant foreigners. In the organized strike Americans as well as foreigners take part.

"Do something to keep these side issues out of the industrial question," urged Dr. Leiserson. "The big thing that is up today in this country is the demand for collective bargaining. It comes in asking more wages, or firing a foreman, or a closed shop, or shorter hours, or something of that kind. Those are the immediate demands. But the important thing is collective bargaining, the right to sit down with the employer, to send a business agent, a lawyer, or whatever you want to call him, a man who knows how to bargain, if it is an ignorant foreigner, and to say to the employer, 'Here is our labor. You want to buy it. We want to talk business with you. You can't have it all your own way, and we will tell you how many hours we are going to work and what we are willing to take for it and so forth.' That is democracy. That is Americanism. That is the issue that has to be fought out now."

The revolutionary strikes are not the dangerous kind. The radical element draws a crowd but seldom gains its demands. "The real danger is when an organization that is strong makes conservative demands and is able to back them up, conservative demands such as the railroad brotherhoods have made; perfectly legitimate and legal." In the case of the railroad brotherhoods and also in the case of miners and others, they have gradually improved their condition to the point that they endanger industry. The railroads, for instance, cannot afford to pay the wages that the railroad brotherhoods are able to get. The only thing left for them to do is to improve their own condition by cutting out the capitalist and turning the railroads over to the Government.

This improvement in the condition of employee to the point where he proposes government ownership of industries is the real revolutionary thing in the industrial situation today. The railroads are in the hands of the Government. The mine workers have already passed a resolution for the government ownership of mines. The working people keep raising their standard of living, and if industry cannot support them on the high plane that they want, it must be revolutionized. This effective, conservative action, looking toward progress, is dangerous to the existing controllers of industry, and its advocates cannot be treated as Bolshevists or Socialists.

"The American Federation of Labor is growing stronger, because it is based upon the important principle of collective bargaining, which is the way we are going to get democracy in industry. Nobody has yet shown us any other way. Employers have said, 'We will have copartnership, profit sharing; workmen will be put on boards of directors.' That is not democracy. That is taking a fellow out of the working class and putting him into the capitalist class. Democracy means taking working people and letting them from day to day practice democracy, vote in industry, make decisions. You won't have any class spirit when the workman, as a workman, will be able to vote. We do not class people politically any more because the commonest man can vote. We won't have any industrial classes when the commonest man can decide, 'I will work so long; I will get so much!' He won't always get his way, any more than when you vote you get your way; but the majority will rule."

Today the radical opposition to the Federation of Labor has given place to a more conservative opposition. On both the labor side and the employers' side a new kind of unionism is challenging the Federation. The new unions, the labor union and the company union, are similar in their principles to the Federation and, therefore, especially dangerous to it. Each one, to some degree, is working for collective bargaining. If collective bargaining is going to succeed it ought to be centered in one organization. If the American Federation of Labor is to be this central organization it needs to improve its own efficiency, for some labor unions are in many ways superior to it. It must be able to understand this gradual uplift of the working people, satisfy their constantly increasing demands and help them maintain their standard of living without jeopardizing industry.

THE HUMAN FACTOR IN THE OPERATION OF INDUSTRY

By DR. HENRY R. SEAGER

DURING the war every country demonstrated that there was latent in its industrial population productive power of a volume that had not been imagined. Wherever it was possible to substitute for the ordinary productive-wages motive, the motive of desiring to do one's utmost to win the war, the productive result was amazing. The armistice had hardly been signed, however, when labor troubles began to prevent production equal even to that before the war.

The key to the solution of the labor problem, as it appears to Dr. Seager, is found in his statement: "The problem in essence is to try to carry over into the period of peace that lies before us some small part of that eager coöperation that we had between employer and employee in some of our munitions plants and in some of our other big producing plants while the war was going on, when both sides for the time being forgot their differences and threw themselves into the work of production."

Dr. Seager outlined *four* ways of handling the labor problem that are currently being tried. One of them is the method of the just and generous small employer, an illustration being found in the case of Mr. Endicott, a shoe manufacturer. Mr. Endicott states that the secret of his immunity from labor troubles for some 35 years is that he always met any one who wanted to see him, whether a labor organizer, or whoever he might be, and that he always tried, not only to keep in touch with the needs of his employees, but to anticipate their needs before they arose. But this method used by Mr. Endicott and also by Mr. Ford is applicable only to a limited range of industries; and, moreover, every employer in an industry cannot do better by his employees than every other employer, as is the case with Mr. Endicott and Mr. Ford in their particularly well-organized industries.

A second method that is being tried in a great many different ways and detail is the method of the giant corporations like the Steel Trust, which tries by means of welfare workers and by means of profit sharing to content its employees and discourage them from going in labor organizations. From a hardheaded business point of view this method has had much to commend it, but when the problem is studied from the point of view of the employee, we find that the wage earners consider welfare work and profit sharing as the tender of a mess of pottage in exchange for the best life of a free-born citizen in a free country. It does not develop loyalty to the employing corporation, because the employees feel that they are being bought, being deterred from doing something that they think they ought to have a perfect right to do, that is, belong to a labor organization and deal with the employer through representatives.

A third method, a method that is receiving a great deal of discussion at the present time, is the method of the shop committee. One employer told Dr. Seager that he had developed this method in his plant to a point where he believed he could leave even the determination of wages to the shop committee. He explained that he laid before the committee all the facts in reference to his business, and that as they were put in a position of responsibility for deciding all questions in the light of the facts, he could depend on their deciding them fairly. But the experience of this employer was possible only because it was a small-scale and rather simple business, employing rather high-class employees.

A fourth plan that is also beginning to receive a great deal of attention, more in the United Kingdom than in this country, is the plan of joint industrial councils. Up to the present time some 75 of the important industries of the United Kingdom have organized these joint industrial councils. In these industries labor and employers were already well organized, and were in the habit of dealing together. They organized this joint organization or council in which both sides are equally represented, which discusses the important problems of the industry that concerns the wage earner, and discusses it, not merely for a single plant, but for the whole industry. Underlying these joint industrial councils are shop committees or works committees, as they call them in England, and district councils, which bring together the representatives of the employers and the employees in the districts.

Of these four plans the last two have been developed on the basis of an attempt to understand the wage earner's point of view and to take account of his desire to have some share in determining the conditions under which he is to work. They differ from the plan of the Steel Corporation, in recognizing the right of the employees to organize and encouraging them to organize. They differ from the method of dealing with the labor organizations as they have been organized in this country, in that at the basis of them is an organization of the employees of the plant, shop committee or works committee, with negotiations between the shop committee and the representatives of the employer in the plant deciding as many issues as possible. Only issues that cannot be decided within the plant are carried up, as it is worked out in England, to a district council, which represents the industry a little more broadly, and only those which the district council cannot decide are carried up still higher to the joint industrial councils, representing the whole country.

We have passed away from the condition of small-scale production and entered a period in which production through giant corporations is becoming more and more the characteristic method of production. Along with that is lost inevitably the contact between the employer and the employee, as in the case of the Steel Corporation. The capital is provided by stockholders, and the business is controlled through a board of directors, which functions through smaller committees made up of men of large financial and business interests. These men naturally live in the financial centers of the country while the industry, on the other hand, is located in the industrial centers. Personal contact between the employer and the employee is out of the question.

There is no doubt of the economic advantages of an organization like the United States Steel Corporation, but such a corporation cannot follow the methods of Mr. Endicott and Mr. Ford. In considering these different plans, this new situation of the giant corporation dealing necessarily at long range with its employees must be kept in mind.

The qualities that, under these new conditions, an employer should have to deal successfully with the labor problem are, first of all, persistent good-will—an attitude of good-will toward his employees that will inspire them with confidence. If they feel that he is trying to get the better of them, their reaction can be counted upon with certainty. They will try to get the better of him at every point. Second, insistence on square dealing. There is nothing that the wage earner is so responsive to, one way or the other, as fair dealing. Third, a sympathetic understanding of the point of view of the employee. The real employer has good-will toward his men, and square dealing is very, very common. But on the third qualification, a sympathetic understanding of the point of view of the employee, of his legitimate desires and his aspirations, employers very often fall down. They very often fail to see the thing from the employee's point of view.

It is also important to consider what are the reasonable demands and legitimate aspirations of the employees. An advertisement for employees summarizes these as: "First, good pay with opportunity for advancement; second, reasonable hours with frequent resting periods; third, safeguards for health; fourth, ample provision for comfort and convenience; fifth, association with other worth-while people; sixth, protection against financial loss in case of sickness or accident; seventh, work that holds the worker's interest all the time." The last-named demand Dr. Seager believes to be the crux of the difficulty and the underlying motive of the different plans discussed. Holding the interest of the worker was the secret of the success of some of our war industries. The work itself was the same old work, divided more than before in many cases, but a tremendous interest was given it because every worker felt that he was working to do his bit for his country, to help win the war. From this point of view, Dr. Seager elaborates these four methods and speaks of others. He discusses several systems of paying wages, of which a most common one is the day-wage system.

Everybody who has had experience with employment feels that

the day wage ought to be about the last resort from the point of view of giving an employee an interest in his work. By itself it almost completely fails to accomplish the purpose, because, under this system, the employee is only too apt to be watching the clock and eager to get away from the factory as soon as the day's labor is over. To give a little stronger incentive, the piece-wage system is tried in many situations. It cannot be tried very generally, because the number of employments to which it is applicable is limited. Some of the difficulties of the piece-rate system were met in the shipbuilding industry during the war. The output was held down for two reasons, the fear that the piece worker would go beyond the limit of his endurance and the conviction of the employee that with increased production would come a cut in rates.

A more refined method of trying to give the worker a certain interest in his work is the premium or bonus plan, which in practice more often than not antagonizes the wage earner and therefore misses the result that it is intended to accomplish. Another plan that is being urged very strongly is profit sharing, which has very great merit in certain industries under certain conditions; but when applied to a large complex industry it largely fails of its purpose all by itself, because the small dribble of profits that goes to the individual wage earner is not enough to give him any special inducement to work better. His share of the profits is almost negligible. Moreover, the worker is intelligent enough to know that whether he works hard or not, the profits will be about the same. As an individual he is not going to effect the result very much; and so the more intelligent he is the less likely he is to respond. A group response cannot be obtained by promising a number of different people a small return if the whole group works together, for there will always be a number of people who will let some one else take the extra burden, reasoning that it will not make much difference to the result whether he works harder or not. A different system of representation is necessary if the employee is to be stimulated to make the right sort of response, if he is made to feel that he is coöperating with the employer in trying to turn out the largest volume of profits, so that he may have as his proportion a larger share as well as the employer. Recognition of the union and collective bargaining is a plan which Dr. Seager believes must be worked out. Organized labor unions tend to divert attention from the productive problem, which is after all the fundamental problem, to the problem of sharing the return of the industry. A plan of organization is needed that will bring home to every employee the fact that on his efforts depends the share that he is going to receive, and if he does not do what he can toward production, then he is bound to lose when it comes to distribution. Under the forms of labor organizations that are developed in this country the notion that there is only a certain amount of work to be done, is all too prevalent.

Dr. Seager said that from the point of view of the possibility of increasing the interest of the employee in his work, the shop-committee plan and the joint industrial plan contain this possibility as the other plans do on the same scale. The shop-committee plan is a plan that recognizes the desire of the employee to have sub-contracts with the larger aspects of the industry, to get out of his particular monotonous job into an appreciation of the higher aspects of the industry, so that he may feel that he has some part in the larger aspects, not in managing the industry exactly, but in understanding it, and seeing its relations to other industries. The employer who objects to this plan on the ground that the employee should not be given a share in the management of the business, looks at it from the wrong point of view. This shop-committee plan interests the employee in the larger aspects of the business. The thing that comes to the surface in almost every dispute is that the wage earners have little or no appreciation of the limitations that surround the employer. The shop-committee plan gives them a wider view of the problem and some insight into the employer's situation. The more they can be taught about the problem that confronts the employer, the more modest their demands will be and the greater their insight into these broad problems of industry.

A necessary accompaniment of the shop-committee plan is the development on the basis of shop committees of district councils and of joint national councils, because after all one plant cannot decide what wages would be fair, what hours would be reasonable and what conditions would be right. A more general view must be obtained in dealing with industries like the United States Steel Corporation, that is organized nationally with plants in all parts of the country, and the reasonableness of the wage-earner's demand that he organize nationally and deal collectively with a nationally organized trust like the Steel Trust, must be recognized.

Many people look upon the current labor unrest as the inevitable accompaniment of the readjustment that must go on because of the higher cost of living and other after-the-war conditions, and optimistically believe that after this readjustment this unrest will disappear. But before the war we were on the verge of the most serious series of strikes and the most awful period of industrial unrest in this country that we have ever experienced. The war came and temporarily it diverted attention. But no sooner was the armistice signed that the unrest began again on a scale greater than we had experienced before the war, and while much of it is due to necessary readjustments, a large part of it is due to a growing dissatisfaction on the part of the wage earner with our present system of industrial organization.

That new spirit, as it has been called, is brought out very strikingly in the sort of demands that are made prominent by representative groups of wage earners. In the Steel strike, for example, the dissatisfaction is not merely with wages or hours or working conditions, but fundamentally it is a demand for recognition of the union and the right of the men to organize and to deal through their chosen representatives with the Steel Corporation. In connection with the railroad situation, the railroad brotherhoods, who have been among our most conservative labor organizations and among the best led and best behaved, have come out strongly for government ownership of the railroads and management by the employees, the higher officials and the representatives of the lower officials. That represents a revolutionary change in the point of view of the leaders of the brotherhood. Before the war they would very generally have opposed the nationalization of the railways, but there is a new spirit and a new point of view, and their demands and their interests are not centered so much in the wage question or in the hour question.

In the same manner, in the coal-mining industry the United Mine Workers has committed itself to a demand for the nationalization of coal mines, an entirely new development, an entirely new angle. "This reflects," Dr. Seager said, "a state of mind that has come to stay, and not only has come to stay, but is becoming and going to become more influential as time goes on, rather than less influential. It represents a demand on the part of the wage earner for a more important relation to industry."

This change of mind has been brought about in a large degree by war conditions. Labor leaders and wage earners have been appealed to as fellow-citizens doing their part in the war to make the world safe for democracy. They have come in closer contact with the employers and have developed a new ambition and a new confidence in their ability to take a larger share in industry. In the stress of the Civil War Lincoln early sensed the fact that a country could not long exist half slave and half free. This new spirit that is so often referred to is the dawning appreciation of the fact that no more can a country long exist the mass of whose population is industrially subservient and controlled and at the same time be politically free and self-determining, the more one thinks of it the more one realizes that there is an inconsistency. If we can trust these men as fellow-citizens to share, man for man, the responsibilities of maintaining this Government, we have got to recognize the legitimacy of their demand for a larger share in connection with the regulation of industrial affairs.

Dr. Seager concluded with the statement: "For the sake of better relations between employer and employee; for the sake of the larger production that will result from better relations; for the sake of the larger incomes that we all may enjoy as a result of this larger production, and for the sake of preserving our democratic institutions by making our democratic Government not only safe but efficient through the lifting to a higher plane of the intelligence and the ability and the sense of responsibility of the wage earner, I believe we must heed this new spirit and this new attitude."

ENGINEERING RESEARCH

A Department Conducted by the Research Committee of the A. S. M. E.

Classification of Information

To explain the method of classifying the various notes in the Division of Engineering Research, the classification prepared by the Industrial Research Committee of Engineering Foundation and the National Research Council has been used. Although it has been difficult to bring certain notes under this classification, an endeavor has been made to do so. In looking up a subject the question should be asked: "Under which of the general headings does the subject naturally fall?" It is hoped that this classification will materially aid the readers of Mechanical Engineering in finding references.

No.	Class	Cross-References
1	Abrasives	Carborundum, Emery, Sandpaper
2	Acids, Alkalies, Salts & Sundries	
3	Agricultural Equipment and Engineering	
4	Air	Air-Driven Machines, Air Products, Compressed Air
5	Aircraft	Aeronautics, Airplanes, Balloons, Dirigibles (See Internal-Combustion Motors)
6	Apparatus and Instruments (Chemical, Physical)	Balances, Compasses, Lenses, Telescopes, Transits, Microscopes
7	Astronomy	
8	Automotive Vehicles and Equipment	
9	Beverages, Non-Alcoholic	
10	Calorimetry, Pyrometry, Thermometry	
11	Cellulose and Paper	Pulp
12	Cement and Other Building Materials	Concrete, Marble, Slate
13	Chemistry, Analytical	
14	Chemistry, Biological	
15	Chemistry, General & Physical	
16	Chemistry, Inorganic	
17	Chemistry, Mineralogical and Geological	
18	Chemistry, Organic	
19	Chemistry, Pharmaceutical	
20	Computing, Recording & Talking Devices	Adding Machines, Phonographs
21	Concentration of Ores	Flotation
22	Dyes and Textile Chemistry	Inks, Pigments
23	Electrical Communication	Cable, Telegraph, Telephone, Wireless
24	Electricity, General	Economics, Insulation, Utilization
25	Electrical Instruments	
26	Electroplating	
27	Electric Power	Conversion, Distribution, Generation, Motors, Transmission
28	Electrochemistry	Electrochemical Processes, Storage Batteries
29	Explosives and Explosions	Dynamite, Power, TNT
30	Fats, Fatty Oils and Soaps	
31	Fire Prevention	Extinguishers, Sprinklers
32	Foods	Bakery, Biscuit, Cold Storage, Preservatives
33	Foundry Equipment, Materials and Methods	Casting, Molding
34	Fuels, Gas, Tar and Coke	Coal, Oil, Peat, Petroleum
35	Fuel Utilization	Boilers, Furnaces, Gas-Producers, Stokers
36	Gases, General	Pneumatics
37	Glass and Ceramics	Bricks, China, Porcelain
38	Heat	Thermal Physics
39	Hydraulics	
40	Illumination (Electric, Gas and Other)	
41	Internal-Combustion Motors	Diesel Engine, Gasoline Engine
42	Iron and Steel	Ferrous Alloys
43	Leather and Glue	
44	Light	Optics
45	Liquors, Fermented and Distilled	Beer and Wine
46	Lubricants	Graphite, Oil, Petroleum
46a	Machine Tools	
47	Magnetism	
48	Marine Engineering	
48a	Mathematics	
49	Mechanics, General	
50	Metal Manufactures, Miscellaneous	
51	Metallurgy and Metallography	
52	Meteorology	
53	Metrology	
54	Military & Naval Equipment	Ammunition, Armor, Ordnance, Torpedoes, Small Arms
55	Mining, General (Testing Drills, Ropes, Tools, Ore Dressing)	
56	Molecular Physics	
57	Non-Ferrous Metals	Aluminum, Brass, Bronze, Copper, Gold, Platinum, Silver, Tin
57a	Oils	
58	Paints, Varnishes and Resins	Dryers, Oil, Pigments, Putty
59	Petroleum, Asphalt and Wood Products	
60	Photography	Cameras, Developers, Films, Moving-Picture Equipment
61	Properties of Engineering Materials	
61a	Protective Devices	
61b	Pumps	
62	Railroad Rolling Stock and Accessories	Cars, Locomotives
63	Railroad Track and Signals	
64	Refrigeration	
65	Road Materials & Equipment	Highways
66	Rubber & Allied Substances	Guttapercha and Substitutes, Rubber Manufactures
67	Safety Devices (Transportation, Manufactures, Mines)	
68	Soils and Fertilizers	Nitrates, Phosphates
69	Sound	Acoustics
70	Steam Power	Economizers, Engines, Turbines
71	Subatomic Phenomena and Radioactivity	
72	Sugar	Sorghums, Syrups
73	Surgical, Dental and Hospital Equipment	
74	Textile Manufacture and Clothing	Cotton, Linen, Wool
74a	Transmission	
75	Water, Sewage and Sanitation	
75a	Wastes	
76	Welding	
77	Wood Products (other than Cellulose and Paper)	
78	Ventilation	

Coöperation in Research by the United States Government

In Mechanical Engineering for August (p. 691) there appeared a letter outlining the action of the British Government in aiding research. Our own country has taken a similar stand in regard to industrial research and the following letter from the Department of the Interior, Bureau of Mines, briefly outlines the manner in which this coöperative work is at present being carried out.

Department of the Interior, Bureau of Mines

Washington, D. C., September 6, 1919

Prof. A. M. Greene, Jr.,
Troy, N. Y.

Dear Sir:

Mr. Bancel calls attention, in the August issue of Mechanical Engineering, to the action of the British Government in subsidizing industrial research by the coöperation of Government and private effort. It may be of interest to call attention to a growing practice in coöperation in the Bureau of Mines, Interior Department.

The Bureau is charged with the duty of conducting "inquiries and scientific and technologic investigations concerning mining and the

preparation, treatment and utilization of mineral substances with a view to improving health conditions and increasing safety, efficiency, economic development and conserving resources through the prevention of waste in the mining, quarrying, metallurgical and other mineral industries." There are other organizations having similar aims in part, and it frequently happens that by combining effort there is mutual advantage in increased facilities and output.

During the fiscal year, 1918-1919, the Bureau of Mines had formal coöperative agreements with the following:

University of Arizona, Tucson, Ariz.
University of California, Berkeley, Cal.
Colorado School of Mines, Golden Colo.
University of Idaho, Moscow, Idaho.
State Geological Survey Div. of the State of Illinois, Urbana, Ill.
Engineering Experiment Station of the University of Illinois.
University of Minnesota, Minneapolis, Minn.
Ohio State University, Columbus, Ohio.
Bartlesville, Chamber of Commerce, Bartlesville Okla.
Oregon Bureau of Mines and Geology, Portland, Ore.
University of Washington, Seattle, Wash.
University of Utah, State School of Mines, Salt Lake City, Utah.
Pope-Shenon Mining Company, Salt Lake City, Utah.
Shannon Copper Company, Clifton and Tucson, Ariz.
Ocotillo Products Company, Indianapolis, Ind.
Sinclair Refining Company, Chicago, Ill.
Mid-West Refining Company and Ohio Oil Company, Denver, Colo.
J. B. Jenson, Salt Lake City, Utah.
Iron Mountain Alloy Company, Colo.

The kind of coöperation varied widely. In several cases the Bureau furnished technical direction and no funds, in other cases both parties furnished technical men and funds; altogether, the financial obligations were in excess of $350,000, about $200,000 being furnished by the Government.

Very truly yours,

(Signed) O. P. Hood,
Acting Director.

A—Research Results

The purpose of this section of Engineering Research is to give the origin of research information which has been completed, to give a résumé of research results with formulæ or curves where such may be readily given, and to report results of non-extensive researches which in the opinion of the investigators do not warrant a paper.

Apparatus and Instruments A13-19 Continuous Helium Recorder. The Bureau of Standards has installed an apparatus at Petrolia, Tex., which records continuously the amount of helium present in the natural gas. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A14-19 Tests on the Constancy of Precision Gages and End Standards. In examining several thousand gages remarkable constancy was found. Gages of 2, 3 and 4 in. changed from two to six-thousandths of an inch in a few months. To find the immediate effect of large temperature changes several gages were cooled in liquid air and then brought back to 20 deg. cent. Some returned to their original length within a few millionths of an inch, but one 3-in. gage was found to be 0.0022 in longer and a 4-in. gage 0.0023 in. longer after the treatment. Several were heated to a higher temperature and allowed to cool to 20 deg. cent. One 2-in. gage which had been heated to 110 deg. cent. was found to be 0.0002 in. longer, and a 4-in. gage heated to 200 deg. cent. was 0.0017 in. shorter after being carried through the temperature cycle. It seems probable that strains must have existed in the material which were relieved by the large changes in temperature. A permanent material is sought for by the Metallurgical Division of the Bureau of Standards. Various types of heat treatment are being proposed. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A15-19 Thermal Expansion. The linear thermal expansion coefficients of a large number of gages has been found to vary from 11×10^{-6} to 13×10^{-6} per deg. cent. It is necessary therefore to use gages at the temperature at which they have been calibrated. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Apparatus and Instruments A16-19 Contact Gages. The forces necessary to separate contact gages is 25 to 35 lb. per sq. in. in using ordinary finish. With high optical polish and tested for planeness by the optical method of interference, 100 lb. per sq. in. was required. The separating film between gages brought carefully into contact is less than two-millionths of an inch. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Boilers and Accessories A2-19 Chimneys. Stack Performance. Experiments on Stack at Johns Hopkins University showed that resistance thermometers would change in readings due to exposure to flue gases. Copper and copper-constantin couples were used with success. There were variations of 5 to 10 deg. fahr. in temperature across a given section. The drop in temperature in 130 ft. varied from 71 to 118 deg. fahr., as shown by table. The velocity of hot gas varied from 5 to 40 ft. per sec. and could not be read by pitot tubes using differential gages. Much leakage of air occurred in system. 10 per cent CO_2 in boilers was reduced to 5 per cent in stack. This cuts down efficiency of stack.

TEMPERATURES AND DRAFT PRESSURES

Series	A	B	C	D
Temperatures, deg. fahr.:				
Breeching	464	390	277	249
Bottom Landing	370	324	226	194
Top Landing	346	313	.....	.....
Top	328	270	206	173
Average from Curve	357	310	221	190
Outside Air	40	38	43	24
Pressures, inches:				
Barometer	30.06	30.00	29.63	30.27
Draft, bottom	0.772	0.697	0.518	0.555
Draft, top	0.038	0.032	0.048	0.05
Draft, for 130 ft.	0.734	0.665	0.470	0.500
Calculated draft for 130 ft.	0.752	0.685	0.492	0.504

See *Power*, September 16, 1919, or address Julian C. Smallwood, Johns Hopkins University, Baltimore, Md.

Properties of Engineering Materials A3-19 Zirconium Steel. The Bureau of Standards is preparing a report showing the heat treatment, impact test and tensile strength of a large number of plates submitted to the Navy for ballistic tests. Thirty-six samples of zirconium steel were analyzed at the Bureau. It has been found that steels which contain boron may be successfully rolled if the temperature is kept below 1000 deg. cent. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Properties of Engineering Materials A4-19 Manila Rope. The action of muriatic acid on manila rope as occurs when used to support swinging staging for washing down brick is such that the fumes weaken the rope seriously without any superficial trace of the action being noticeable to the eye. The only practicable remedy is to treat the rope with some acid-resisting compound. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Properties of Engineering Materials A5-19 Concrete Columns and Protective Plasters. The work of the Bureau of Standards previously reported has been carried on in making fire tests of full-size columns with different forms of protection and of different aggregate. It has been found that columns made from Cow Bay gravel which contains a large proportion of granite and gneiss pebbles and columns made from pure quartz gravel give results which are not quite so good as those from columns made from Pittsburgh gravel. The columns of this latter form had protective concrete spalled so badly that the steel and load-bearing concrete were exposed to the fire and failed before the completion of the four fire tests. Columns with coarse aggregate of trap rock showed no tendency to spall. To protect columns gypsum forms have been used in the construction of the columns and these forms are allowed to stay in place as a protective cover. These have given excellent protection. When the protective covering was made of plaster of portland cement and sand, the results were good but not so good as those from trap rock and slag. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

B—Research in Progress

The purpose of this section of Engineering Research is to bring together those who are working on the same problem for coöperation or conference, to prevent unnecessary duplication of work and to inform the profession of the investigators who are engaged upon research problems. The addresses of these investigators are given for the purpose of correspondence.

Air B4-19 Blowers. Performance of blowers operating in parallel. No. 797. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Air B5-19 Orifices. Flow of air through orifices from the atmosphere into a vacuum, No. 704. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Apparatus and Instruments B14-19 Screw Threads. Precision Measurements of Screw Threads. Pratt and Whitney Company, Hartford, Conn.

Electricity B1-19 Electricity in Mines by L. C. Ilsley. This investigation is to cover permissibility, explosion-proof motors, portable electric mine lamps, flame safety lamps, gas detectors, permissible electric headlights, electric lamps for rescue service, electric flash lamps, single-shot blasting units, multiple-shot blasting units, storage-battery locomotives, electric trip lamps, field investigation, laws and rules governing the use of electricity in mines. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Electric Power B4-19 Carbon Electrodes. An investigation on the manufacture of carbon electrodes to devise method for manufacture of large carbon electrodes from western material by L. C. Duschak,

Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Gases, General B1-19 Production of hydrogen from crude oil for use in balloons, test 1097. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Gases, General B2-19 Production of hydrogen from steam and coal, and by electrolysis of salt solution, test 1161. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Hydraulics B4-19 Flow of oil through orifices and tubes, No. 665. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Hydraulics B5-19 Condenser Tubes. Investigation to determine the effect of temperature, tube length and water velocity upon friction loss in water flowing through condenser tubes, No. 789. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Internal-Combustion Motors B7-19 High-Altitude Performance. The Bureau of Standards is testing a 300-hp. Hispano-Suiza engine at conditions on the ground and at 25,000 ft. elevation at various speeds and under different openings of throttle. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Internal-Combustion Motors B8-19 Ignition. The Bureau of Standards is endeavoring to detect turbulence within a gas-engine cylinder and to determine its effect upon the velocity of flame propagation. Turbulence seems to be without effect in the vertical plane while with advanced spark the velocity of propagation increases. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Internal-Combustion Motors B9-19 German Truck engines. The Bureau of Standards is examining the engines of several German motor trucks. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Lubricants B4-19 Lubricating Oils. Investigations pertaining to the methods for the examination of lubricating oils in conjunction with Committee D-2, A.S.T.M., U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Lubricants B5-19 Frictional qualities of paraffin- and asphaltic-base mineral oils and of animal oils. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Lubricants B6-19 A fractional distillation of lubricating oils before and after use. Continuation of the work reported in the Journal A.S.N.E., for May, 1917. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Lubricants B7-19 The cause of emulsifying properties of oils with water in turbine oils, test 680. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Lubricants B8-19 Methods of analyses of lubricating greases, test 822. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Machine Tools B3-19 Milling Hobs. Side Cutting of Thread-Milling Hobs. Address Pratt & Whitney Company, Hartford, Conn.

Machine Tools B4-19 Machine-Tool Investigations. To determine the power required and the action of various types of cutting tools and the effect of heat treatment of tool steel. A planer at the Bureau of Standards has been equipped with a dynamometer, and various pyrometers and potentiometers have been calibrated. This work is being carried out in connection with machine-tool manufacture. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Metallurgy and Metallography B7-19 Deep Etching of Steel. The Bureau of Standards is carrying on work on deep etching of steel which so far seems to reveal a chemical heterogeneity, mechanical non-uniformity and physical discontinuities. Steels which are highly stressed internally often split open spontaneously under the action of concentrated acids. Magnetic investigation locates defects in materials which had developed transverse fissures in service in the same manner that deep etching reveals this. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Metallurgy and Metallography B8-19 Crucibles. Microscopic investigations of graphite crucibles by A. C. Fieldner and Reinhardt Theissen. The aim of this investigation is to discover the merits of various graphites used in crucible making and whether or not American graphites can be substituted favorably for foreign graphites and to overcome difficulties in crucible making. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Metallurgy and Metallography B9-19 Electric-Furnace Work. Electric brass-furnace practice in the United States, by H. W. Gillett. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Metallurgy and Metallography B10-19 Ferroalloys, by H. W. Gillett. Continuation of War Materials Investigations on ferromanganese and silicomanganese, ferrouranium and ferrozirconium. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Metallurgy and Metallography B11-19 Studies of the effect of heat treatment on microstructure and properties of metals. Test 602, and tests of failed materials. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, U. S. Navy, Washington, D. C.

Metallurgy and Metallography B12-19 Sulphur and Phosphorus Content in Steel. The Bureau of Standards is planning a laboratory investigation and service tests involving the coöperation of steel manufacturers, users and the Bureau of Standards to determine the phosphorus and sulphur limits for specifications of various kinds of steel. Address Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Metallurgy and Metallography B13-19 Ferrous Metallurgy, by Francis B. Foley. An investigation in coöperation with the National Research Council to determine whether or not brittleness is induced in carbon steels by slow cooling from below the critical temperature, also to attempt to determine the cause and effect of certain defects in nickel ordnance steels. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Oils B2-19 Oil-Extraction Equipment. A study of present types of equipment for extracting animal and vegetable fats and oils from oleaginous material by means of volatile solvents, particularly from the standpoint of economy, ease of operation and quality of finished product. Address J. H. Shrader, U. S. Bureau of Agriculture, Washington, D. C.

Properties of Engineering Materials B4-19 Limestone tests are being made on Indiana Limestone to establish data for the grading of this stone. Panels are being erected exposed to the weather so as to find the cause of discoloration. Various mortars and various methods of waterproofing are used. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Properties of Engineering Materials B5-19 Frost-Action Tests. Commercial sandstones are being tested by the Bureau of Standards to determine the disintegration under freezing. High-grade sandstones have stood 300 freezings with but few signs of disintegration, while poorer grades were completely broken down in less than 100 freezings. Granite passed through 300 freezings without showing any signs of freezing, while porous limestone began to disintegrate after 150 freezings. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Textile Manufacture and Clothing B3-19 Determination of the permeability of balloon fabric by hydrogen. U. S. Naval Experiment Station, Annapolis, Md. Address Bureau of Steam Engineering, Washington, D. C.

Wastes B1-19 Wastes, Vegetable, Utilization of. Mechanical and Industrial problems connected with commercializing waste products either discarded or marketed disadvantageously at present. Address Dr. J. H. Shrader, U. S. Bureau of Agriculture, Washington, D. C.

F—Bibliographies

The purpose of this section of Engineering Research is to inform the profession and especially the members of the A.S.M.E. of bibliographies which have been prepared. These bibliographies have been prepared at the request of members, and where the bibliography is not extensive this is done at the expense of the Society. For bibliographies of a general nature the Society is prepared to make extensive bibliographies at the expense of the Society on the approval of the Research Committee. After these bibliographies are prepared they are loaned to the person requesting them for a period of one month. Additional copies are prepared which are available for periods of two weeks to members of the A.S.M.E. or to others recommended by members of the A.S.M.E. These bibliographies are on file in the offices of the Society and are to be loaned on request. The bibliographies are prepared by the staff of the Library of the United Engineering Society, which is probably the largest Engineering Library in this country.

Air F4-19 Use of Compressed Air in Petroleum Oil Wells. A bibliography of 2½ pages. Search 2682. Address A.S.M.E., 29 West 39th St., New York.

Fuels, Gas, Tar and Coke F4-19 Coals Used in Producers. A bibliography of 1 page. Search 2681. Address A.S.M.E., 29 West 39th St., New York.

Fuels, Gas, Tar and Coke F5-19 Extraction of Gasoline from Natural Gas. A bibliography of 3¼ pages. Search 2717. Address A.S.M.E., 29 West 39th St., New York.

Oils F1-19 Extraction and Refining of Cocoanut or Copra Oil. A bibliography of 12½ pages. Search 2523. Address A.S.M.E., 29 West 39th St., New York.

Railroad Tracks and Signals F1-19 Mechanically Operated Railway Signals. A bibliography of 3 pages. Search 2704. Address A.S.M.E., 29 West 39th St., New York.

WORK OF THE BOILER CODE COMMITTEE

THE Boiler Code Committee meets monthly for the purpose of considering communications relative to the Boiler Code. Any one desiring information as to the application of the Code is requested to communicate with the Secretary of the Committee, Mr. C. W. Obert, 29 West 39th St., New York City.

The procedure of the Committee in handling the cases is as follows: All inquiries must be in written form before they are accepted for consideration. Copies are sent by the Secretary of the Committee to all of the members of the Committee. The interpretation, in the form of a reply, is then prepared by the Committee and passed upon at a regular meeting of the Committee. This interpretation is later submitted to the Council of the Society for approval, after which it is issued to the inquirer and simultaneously published in MECHANICAL ENGINEERING, in order that any one interested may readily secure the latest information concerning the interpretation.

Below are given the interpretations of the Committee in Cases Nos. 243, 244, 247-256, inclusive, as formulated at the meeting of September 26, 1919, and approved by the Council. In this report, as previously, the names of inquirers have been omitted.

CASE No. 243

Inquiry: Is the design of a vertical single-flue boiler, as shown in Fig. 2, which is formed of a seamless steel tube for the vertical flue, expanded into openings in the crown sheet and top head of the boiler, acceptable under the requirements of the A.S.M.E. Boiler Code?

Reply: A boiler of the vertical single-flue type, constructed with dished heads for crown sheet and top head, in order to come under the requirements of the Boiler Code, must conform to the requirements of Par. 195, dealing with a dished head having a flanged opening supported by an attached flue (see page 50, last sentence of Par. 195, Edition of 1918). To meet this requirement, the flue which connects the top head and crown sheet of the boiler should be attached by a riveted flanged connection at each head.

CASE No. 244

Inquiry: Will it be permissible to use lap-welded steel pipe for the grate headers used on down-draft furnaces of the Hawley type if the material conforms to any one of the specifications in the Boiler Code?

Reply: Under the requirements of Par. 9, pressure parts for grate headers on down-draft furnaces and of other similar parts to be used for boiler construction, may be constructed from material which in its initial form of plate or skelp, conforms to one or the other of the specifications given in the Boiler Code for wrought steel, or they may be constructed of cast steel of Class B grade. If the header referred to in this case is built of lap-welded steel, any steel that will conform with the requirements of the specifications in the Code may be used.

CASE No. 247

Inquiry: In fitting twin safety valves to a boiler, is it permissible to mount valves of different sizes, or shall the requirements of the Boiler Code be construed to require valves of equal sizes?

Reply: There is no requirement in the Boiler Code which covers this case. The Committee, however, recommends that the valves be made of equal sizes, if possible, and that in any event the smaller of the two valves shall have a relieving capacity of at least 50 per cent of that of the larger valve.

CASE No. 248

Inquiry: Is it necessary under the material requirements of the Boiler Code that a connecting pipe external to the boiler setting between the boiler and superheater be made of open-hearth quality lap-welded pipe, or may bessemer steel pipe be used?

Reply: It is the opinion of the Committee that pipe connections external to the boiler setting do not come under the requirements of the Boiler Code, but it is recommended by the Committee that since this is a part of the boiler proper in the sense that it cannot be closed off by intervening valves, pipe connections of open-hearth-steel material should be used.

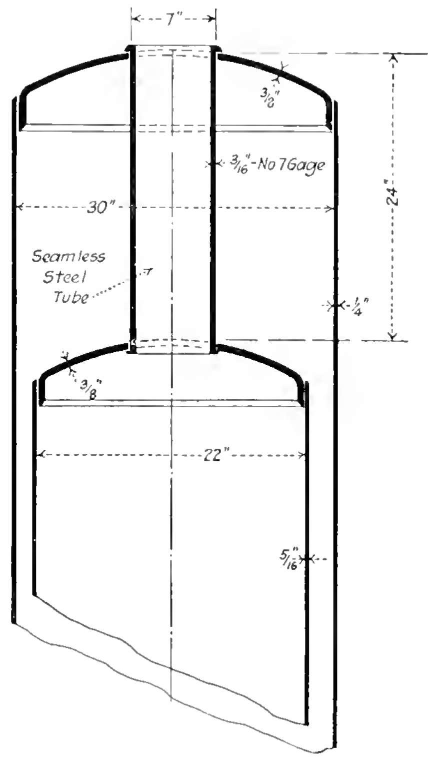

FIG. 2 A DESIGN OF VERTICAL SINGLE-FLUE BOILER

CASE No. 249

Inquiry: Is Par. 427*e* of the Boiler Code applicable to water glasses of the chain-pull, quick-closing type, in which there is a limit of movement of about one-third revolution of the valve stem? This requirement appears to be a practically impossible construction for an automatic gage of the quick-closing type.

Reply: It is the opinion of the Committee that for chain-pull, quick-closing-type water glasses, the requirements in Par. 427*e* can be met by the application of a pulley over which the chain-pull may be operated to turn the valve stem the necessary amount.

CASE No. 250

Inquiry: Is it permissible for qualified boiler inspectors to transfer stampings to the remnants from flange or firebox boiler plate which bear no identifying mark, yet are none the less available for use?

Reply: It is the opinion of the Committee that under the requirements of the material specifications of the Boiler Code, it is not permissible for boiler-plate stampings to be transferred by any one except an authorized mill agent or representative. Attention is called to the fact that under Par. 36 of the Code, markings are required to appear in the completed boiler only on shells, heads and butt straps.

CASE No. 251

Inquiry: Will the requirement in Par. 291 of the Boiler Code, which specifies that a gage glass shall be set not less than 2 in. above the lowest permissible water level, not be inclined to cause lifting of water through the steam outlet or by the operation of

the safety valve, in a small return tubular boiler having only a 12-in. segment above tubes and a fusible plug set 2 in. above tubes which would thus reduce the steam space from 12 to 8 in.?

Reply: It is the opinion of the Committee that a suitable internal collecting pipe or splash plate may be employed to advantage in such a case.

Case No. 252

(In the hands of the Committee)

Case No. 253

(In the hands of the Committee)

Case No. 254

Inquiry: Is it permissible to burn out tube holes with the oxy-acetylene torch, provided the amount of metal removed does not exceed that required by Par. 248 of the Boiler Code, and that they be finished as provided therein? Also is it permissible to burn off surplus metal from the edges of plate by means of the oxy-acetylene torch provided the full amount of metal is removed thereafter as required by Par. 257 of the Boiler Code? In other words, the purport of the above inquiries is in brief — may the burning process be substituted for the punching and shearing processes?

Reply: It is the opinion of the Committee that this method is allowable where punching or shearing is specified, and where the edges are afterward machined by drilling, reaming, chipping or planing to remove a specified amount of material as required by Pars. 248 and 257 of the Boiler Code.

Case No. 255

Inquiry: Does the requirement in the reply for Case No. 218 that headers and manifolds of superheaters must be constructed from material which in its initial form of plate or skelp conforms to one or the other of the specifications in the Boiler Code for wrought steel, or they may be constructed of cast steel of Class B grade, require that if the Specifications for Lap-welded and Seamless Boiler Tubes are to be met, that the flattening test be met and the material as specified for the tubes be also met?

Reply: It was intended in the reply to Case No. 218 to specify the quality of the material in its initial form of plate or skelp and not to require tests of the completed tube, so that the flattening tests referred to in the Specifications need not be considered in this connection.

Case No. 256

(In the hands of the Committee)

ARMY MOTOR-TRANSPORT VEHICLES

(Continued from page 863)

truck carrying 1200 gal. of water was fitted with a heating device taken from a steam car, enabling the water to be brought to a good temperature. A centrifugal pump at the front end of the tank, geared to the engine of the truck, pumped this hot water under pressure through hose pipe to a system of gas piping with spray nozzles allowing twenty-four soldiers to have shower baths simultaneously. Attached to this truck was a trailer or sometimes another truck carrying the cleaned clothing. Its mobility allowed it to be kept in close contact with the front line, where full service could be given. Incidentally, this was similarly used for delousing purposes and ordinary shower baths.

Special Features for Military Work

Military operation demands special equipment. Trucks operated in convoy over long periods of time tend to make the drivers "dopy"; the short space separating the trucks is not always sufficient to prevent one truck running into another either backward or forward, therefore ample rear and fore bumpers or guards must be provided. Proper towing hooks must also be provided front and rear to enable a disabled truck to continue its journey, for supplies must not be left behind. The standard artillery type of pintle hook is now universal at the rear of American military trucks and at the front two hanging towing hooks are provided, one on each side of the frame.

In running in convoy a tremendous amount of dust is raised and often drivers in the middle and rear are almost unable to see through this fog. This dust finds its way through the air intake into the carburetor, into the engine and causes rapid wear of the piston, cylinders and other parts. This is a problem peculiar not only to military operation, but also to agricultural-tractor operations. The remedy is found in the provision of an air-cleaning device to filter out the dust and grit, allowing only clean air to enter the engine.

Extra wide drivers' seats must also be provided. Provision must be made for two soldiers to sit alongside the driver, and soldiers with their heavy overcoats and various accouterment are necessarily bulky. A reserve supply of gasoline must likewise be provided for, and this was done in some of the military trucks by the provision of receptacles like milk cans. It is desirable to have special lamp equipment, on which there should be considerable research done in order to obtain sufficient light to operate, but insufficient for the enemy to notice. At the advanced front even a lit cigarette was not tolerated and driving was done either looking at the stars between the trees or by sound and, in some cases, by instinct. The motor-transport driver's job, contrary to general opinion, was among the most hazardous at the front and certainly was one of the hardest, and honor should be given to these men who kept motor transportation operating faithfully through periods of extreme stress in complete darkness, men who were as equal to their task as the machines beneath them.

Conclusions

At various points throughout this paper the question of the Army designing its own vehicles and the question of standardization have been brought out. In concluding the writer feels that it is insufficient merely to state the classification of vehicles used without drawing attention to the fact that they do not always remain new, but have to be repaired by Army help. In other words, this means using the help at one's disposal without the ability to obtain any other. Furthermore, the vehicles in order to be of economic use must be maintained and the maintenance problem must be simplified down to its very elements, and in this it is obvious that with the fewer the types of trucks the fewer will be the number of parts necessarily carried for replacement and the less the need for skilled mechanics. There should be a standardization of one type of vehicle in each classification. Perhaps the Army will decide to adopt some commercial type of vehicle as its standard; perhaps they may decide to develop their own. They should not be subject, however, to political agitation which would seek to provide them with vehicles unsuited for their direct needs. When this standard has been adopted it should be reasonably adhered to for a period of approximately five years before any serious change is contemplated (unless, of course, there is some tremendously radical alteration in motor-vehicle design).

Standardization of equipment, limitation of sizes of tires, of bodies, of lamps and tools and of all the hundred-and-one things that go to make up the various automotive equipment will be found not only desirable but highly essential. A long paper could be written on this subject alone, but it is felt sufficient to here only mention this part of the Army's problem and also state that by carrying this out the Army may be reasonably sure of having its vehicles give them a useful life of, say, ten years, if not more, without any scrappage or undue delays or economic waste due to failure to function.

A French concern has developed a traveling crane of reinforced concrete. The crane, as described in *Le Génie Civil,* has a capacity of 6600 lb. and a span of 32.8 ft. The rolling gear is removable and so attached that it can be adjusted to take care of any warping of the crane. The concrete used is made of 2.3 bbl. of cement to 1.18 cu. yd. of gravel and 0.52 cu. yd. of sand, a mixture which develops a crushing strength of about 780 lb. per sq. in. and a bond strength with the reinforcing of about 80 lb. per sq. in. To obtain a proper factor of safety, the maximum fiber stress in the concrete of compression members is limited to 498 lb. per sq. in even under the most favorable conditions.

ENGINEERING SURVEY

A Review of Progress and Attainment in Mechanical Engineering and Related Fields, as Gathered from Current Technical Periodicals and Other Sources

SUBJECTS OF THIS MONTH'S ABSTRACTS

BUREAU OF STANDARDS

A Relation Connecting the Derivatives of Physical Quantities, Mayo D. Hersey, Mem.Am.Soc.M.E. In this paper the author shows how the theory of dimensions may be used in a differential form, a procedure which appears particularly fruitful in investigating the effects of given sources of error on the performance of measuring instruments. Several examples showing the necessity for the application of this method are given and illustrated by experimental data. The application of the theory established is discussed in connection with the following cases:

(1) Variation of journal friction with size of bearing. Equations are given which enable one to predict the bearing losses of any slightly larger or smaller machine in the same geometrically similar series.

(2) The effect of gravity on a rolling-ball viscosimeter in terms of the effect produced by changing the size of the instruments.

(3) The effect of high pressure on the accuracy of a rolling-ball viscosimeter. In this case means are derived to predict the change in roll time due to any small change in liquid density such as would occur by using the tube under pressure by reference to an observation on the effect of changing the ball density. (*Scientific Papers of the Bureau of Standards,* No. 331, issued September 25, 1919, pp. 21-29, *t*4. Copies may be had by addressing the Bureau of Standards.)

Equilibrium Conditions in the System Carbon, Iron Oxide, and Hydrogen, in Relation to the Ledebur Method of Determining Oxygen in Steel, J. R. Cain and Leon Adler. It is shown that mixtures of iron oxide and acheson graphite are not, and mixtures of iron oxide with "cemented" iron or white iron (annealed or unannealed) are, reduced at 900 deg. cent. by the carbon in them when hydrogen is passed over them at rates of two liters per hour or faster. Because of these facts, it is probably impossible to determine by the Ledebur method more than 75 per cent of the oxygen present in steels as ferrous oxide. The effect of rate of passage of hydrogen on the Ledebur oxygen content of certain steels is shown. (*Abstract of Scientific Paper* No. 350, *U. S. Bureau of Standards, e*)

An Apparatus for Measuring the Relative Wear of Sole Leathers and the Results Obtained with Leather from Different Parts of a Hide, R. W. Hart and R. C. Bowker. A short paper dealing with the development of a simple machine for testing the wear resistance of sole leathers and giving the results of extensive research work on the relative resistance to wear in different parts of a bend. The machine, which is described at various stages of its development up to the present time, was designed to subject leather to an abrasive action similar to that which it undergoes on a shoe sole, and to accelerate the wear so that a test could be completed in 24 hr.

The results of three extensive tests on the resistance to wear in different parts of a bend are given with detailed description of the manner in which these tests were made,— one test showing the results of comparative wearing tests both on the machine and in actual service included in this paper. The results of all investigations show that the laboratory testing machine gives a proper indication of the wearing resistance of leathers. (*Abstract of Technologic Paper* No. 147, *U. S. Bureau of Standards, e*)

HYDRAULIC ENGINEERING

Water-Turbine Governing by Dispersion

Seewer Governor for High-Head Hydraulic Turbines of the Pelton Type, Dr. A. Strickler. Description of a turbine governor designed by a Swiss engineer, M. Seewer. In his system the primary method of governing, that is, the deviation of the water jet, is replaced by a simple dispersion which he secures by means of mobile guide elements located in the interior of the injection

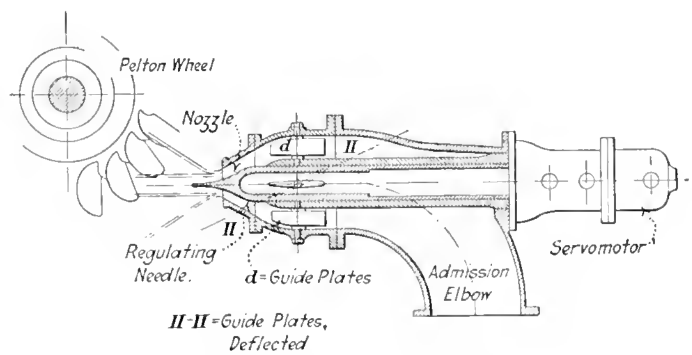

Fig. 1 Seewer Governor for Pelton Water Turbines

nozzle. This mechanism admits of eliminating practically entirely the stresses in the primary system and reduces the path of flow to a very considerable extent, this latter being entirely independent of the diameter of the jet and power output of the turbine. Because of this the system is capable of functioning practically instantaneously and permits the use of the same governor for all sizes of turbines, the only change being in the servomotor operating the needle. It has been extensively tested at the Laboratory of the Federal Polytechnic School at Zurich.

The fundamental principle if the Seewer system of governing is expressed by the author as follows:

"The device is one in which the governing of a high-speed hydraulic turbine is effected by a change in the shape of the jet, this latter being done by guide members located in the interior of the jet nozzle and so arranged that the jet may be either practically perfectly cylindrical or may be totally or partly dispersed in accordance with the position of the guide elements."

Fig. 1 shows diagrammatically the arrangement of the device. The guide elements which are flat plates of proper shape and in proper number are located around the jet needle. They can swing about a radial axis. When these guide plates are parallel to the axis of the jet tube, the jet is perfectly cylindrical as in Fig. 2. It is a well-known fact that when the water jet is even slightly

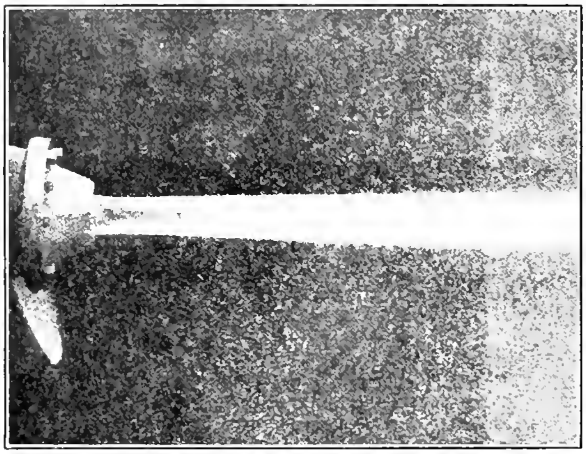

FIG. 2 FULL JET OF A PELTON TURBINE WITH SEEWER GOVERNOR AND GUIDE PLATES PARALLEL TO EACH OTHER

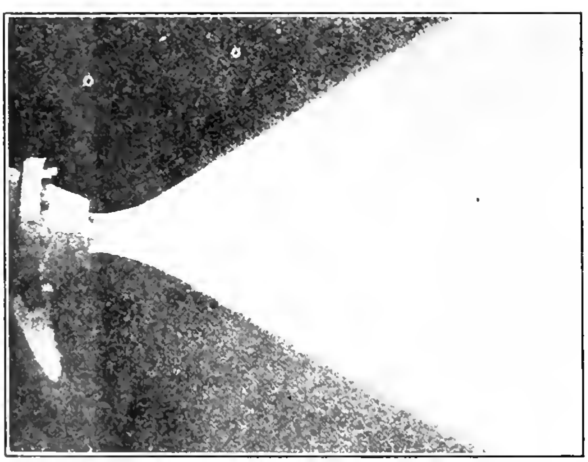

FIG. 3 DISPERSED JET OF PELTON TURBINE WITH SEEWER GOVERNOR AND GUIDE PLATES AT AN ANGLE OF 20 DEG.

dispersed this produces a material reduction in the hydraulic efficiency of the turbine, but a change in the position of the guide plates, such as shown in Fig. 1, by the line II-II, causes a complete dispersion of the jet as it comes out of the nozzle, because of which none of the water goes to the wheel in a manner to produce a useful power output.

It is easy to understand it by studying the relative path of the liquid fibers. Fig. 3 shows the dispersion of the jet caused by a displacement of the guide plates through an angle of about 20 deg.

Since the quantity of water coming out from the nozzle is practically the same with the deflected jet as with the solid jet, there is no material increase in pressure in the feed conduit, and the latter cannot suffer any harm because of a sudden deflection of the jet. *(Bulletin Technique de la Suisse Romande*, vol. 45, no. 17, Aug. 23, 1919, pp. 169-171, 3 figs. *de*)

ENGINEERING MATERIALS

ON THE STRUCTURE OF IRON-CARBON-CHROMIUM ALLOYS, Takejiro Murakami. This investigation forms the subject of the 24th Report of the Alloys Research Institute.

In the present case various iron-carbon-chromium and iron-chromium alloys have been investigated by magnetometric and thermal methods. The following are the conclusions arrived at by the author:

1 By utilizing magnetic analysis and microscopic observation the iron-carbon-chromium alloys containing less than 6 per cent of carbon have been systematically investigated, and a structural and constitutional diagram of their states has been obtained. The change of structure during heating and cooling up to 1200 deg. has also been discussed.

2 By microscopic observation a probable diagram for binary alloys of chromium and carbon containing less than 5 per cent of carbon has been determined, and this has confirmed the existence of a compound Cr_4C having a hexagonal crystal form, as put forward by Moissan, and also the formation of a eutectic consisting of the carbide and chromium dissolving the carbide.

3 Iron and chromium form a continuous series of solid solutions, whose critical point for the A_2 transformation decreases as the chromium content increases.

4 In the iron-carbon-chromium alloys there exist three ternary compounds, α, β and γ double carbides, having the probable formula $(Fe_3C)_{18}.Cr_4C$, $(Fe_3C)_9.Cr_4C$ and $Fe_3C.Cr_4C$, respectively. The former two crystallize in a scaly form, and the latter in a hexagonal prismatic form. The α carbide is a magnetic compound, whose critical point is 150 deg., while the other two are non-magnetic.

5 Under microscopic observation, these carbides can easily be differentiated from each other by means of a new reagent, an alkaline solution of potassium ferricyanide. By this reagent, γ carbide is intensely colored brown to blue in cold and β carbide equally colored by the same reagent at boiling temperature, while these carbides are not acted on by picrate boiling. α carbide is colored brown both by a boiling ferricyanide solution and also by picrate.

6 The lowering of the transformation point is caused by dissolved chromium. Above Ac_1 point the carbide Cr_4C dissolves in austenite and by heating to a suitably high temperature it dissociates according to the following scheme:

$$2\ Cr_4C = Cr_3C_2 + 5\ Cr$$

The higher the temperature, the more the above change proceeds from left to right. During cooling, the recombination of Cr_3C_2 and chromium to the carbide Cr_4C takes place only slowly, and therefore, in alloys containing the carbide Cr_4C, the carbide change is lowered by the normal cooling from a high temperature by the retarding action of the dissolved chromium.

7 The cooling rate has generally a marked effect on the position of the transformation points. If the rate be very large, the transformation is very conspicuously lowered, and in some cases is completely suppressed. On the contrary, if the rate of cooling through a range of 700 deg. be sufficiently slow, the carbide change takes place within the range.

8 The cooling magnetization-temperature curves of a specimen and its microstructure have a close connection with each other. A specimen having the normal transformation point shows the troostitic or pearlitic structure, the one having the lowered transformation the martensitic, and the other having the completely suppressed transformation the austenitic structure.

9 The self-hardening of a chromium steel is related to the lowering or complete suppression of the Ar_1 transformation; the hardness is caused by the solid solution of the carbide Cr_3C_2 in iron dissolving chromium.

10 The Ac_1 and Ar_1 points in chromium steels are raised as the chromium content increases, and the former becomes higher than the Ac_2 point from high-chromium steels. *(Science Reports of the Tohoku Imperial University*, First Series, vol. 7, no. 3, December 1918, pp. 219-276 and 20 plates, *etA*)

INTERNAL-COMBUSTION ENGINEERING

Diesel Engines Used in British Submarines

Vickers Diesel Engine. Some data on the design of the Vickers Diesel engine, which is of particular interest since practically the whole of the British submarine fleet is driven by these engines.

The engines described are mainly those of the Trefoil type, a war-time production built in the greatest hurry to meet a national emergency.

The eight cylinders of each set—17 in. bore by 27 in. stroke—are based upon the submarine design, and are of the simplest possible form, consisting of a plain liner, of which the head is held in a cast-steel entablature which is common to a pair of cylinders, and which forms the upper part of the water jacket (compare Fig. 4). The lower part consists of a light galvanized wrought-iron cylinder held by the entablature and jointed to the lower end of the liner by rubber rings. This design is not suitable, however, to purely commercial work. The cover is a simple steel casting carrying the inlet and exhaust valve and the fuel nozzle and relief valve, the cooling water passing direct from the cylinder jacket to the interior of the cover without the more usual little pipe connection.

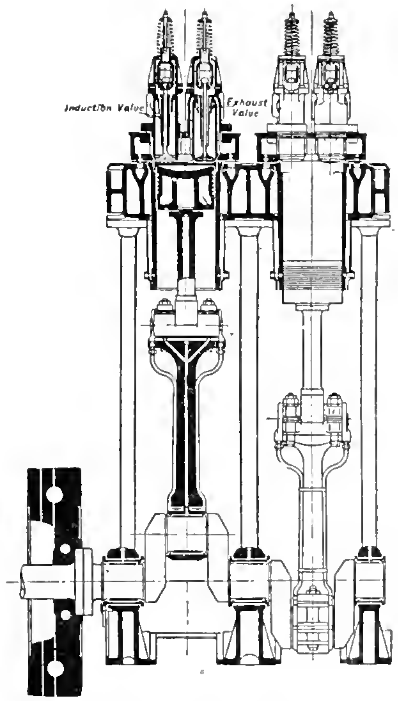

Fig. 4 Cylinder Construction of the Trefoil Type Vickers Diesel Engine

The submarine engine framing is shown in Fig. 5, which consists simply of an A-shaped piece of boiler plate placed athwartships between the cylinders, something less than an inch in thickness, lightened out and with a forged-steel flange top and bottom riveted on to take the cylinder and bedplate bolts, with light iron angles riveted along the sides to act as stiffeners and to take the splash plates. Increased lateral stiffness is obtained by horizontal fore and aft plates between each pair of columns, which improves the bottom of the water jacket. This kind of framing was suitable for the submarine engine with its trunk piece, but the engines of the Trefoil have ordinary crosshead and guide. Because of this, in the Trefoil engine each cylinder has a cast-iron box column at the back carrying the guide, and well splayed fore and aft at the foot, in addition to which there is a turned steel column in front at each main bearing.

The crosshead arrangement allows of a very short piston which is not water-cooled. As a cylinder only gives something less than 100 b.hp., the total power of each set of eight cylinders is 750 b.hp. at 1500 r.p.m.

The top end of the connecting rod is novel, as the whole of what is ordinarily the fork is used as a bearing surface for the gudgeon pin.

Solid injection is used and the four fuel pumps deliver into a common pipe for all the cylinders. From that pipe the spray valves are fed, the regulation of the fuel injected being effected by the adjusting the duration of opening of the spray valves, the

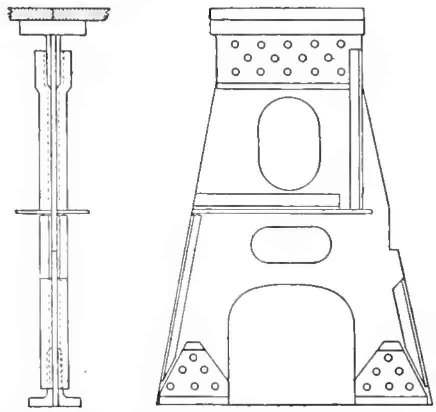

Fig. 5 Submarine Engine Framing Vickers Diesel Engine

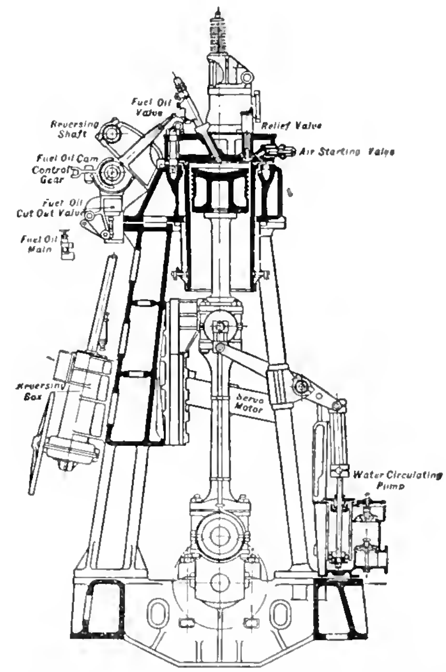

Fig. 6 Cylinder Construction and Reversing Arrangement of Trefoil Type Vickers Diesel Engine

fuel pressure in addition being reduced at low power from the 3750 lb. or so, used at full speed.

For reversing, a special reversing shaft is provided above the camshaft, which latter runs along the top of the cylinders and is driven by a vertical shaft through bevel gears. This reversing shaft carries two rockers for each valve on eccentric fulcra, so disposed (Fig. 6) with regard to each other that when one is engaged with its cam the other is clear, the two corresponding cams on the camshaft being fixed on that shaft for ahead and astern going, respectively. Thus, a half turn of the reversing shaft puts the inlet and exhaust valves right for the intended direction of rotation, but the fuel cam block with its ahead and astern cams has to slide along the shaft by means of a separate maneuvering shaft, and this can be done without the necessity of raising the rockers clear of the cams by reason of a slope on the side of the nose of the cams. Control of the period of fuel injection is ob-

tained in a very simple way by the eccentric mounting of the fulcrum of the fuel valve rocker.

When the cams are set in the proper position the master air valve is opened and air delivered to four little cam-operated valves, which deliver the air through separate pipes to non-return valves in each cylinder head, the valves and cams being on a vertical shaft and situated near the starting handles. (*The Engineer*, vol. 128, no. 3322, August 29, 1919, pp. 198-200, 4 figs., *d*. Compare also the reprint of the article in the *Journal of the American Society of Naval Engineers*, vol. 31, no. 3, August 1919, pp. 661-671, 5 figs.)

Novel Type of Heavy-Oil Engine and Its Governor

The Crossley Cold-Starting Heavy-Oil Engine. Description of an engine of British design in which the use of the lamp for starting has been done away with.

The engine belongs to the type of heavy-oil engines, but cannot be correctly described as being either a Diesel or semi-Diesel. In fact, it would appear as if the engine, in some respects, was in a class by itself. The essential characteristic feature of the engine is the shape of its combustion chamber, which, as shown in Fig. 7, *C*, is spheroidal.

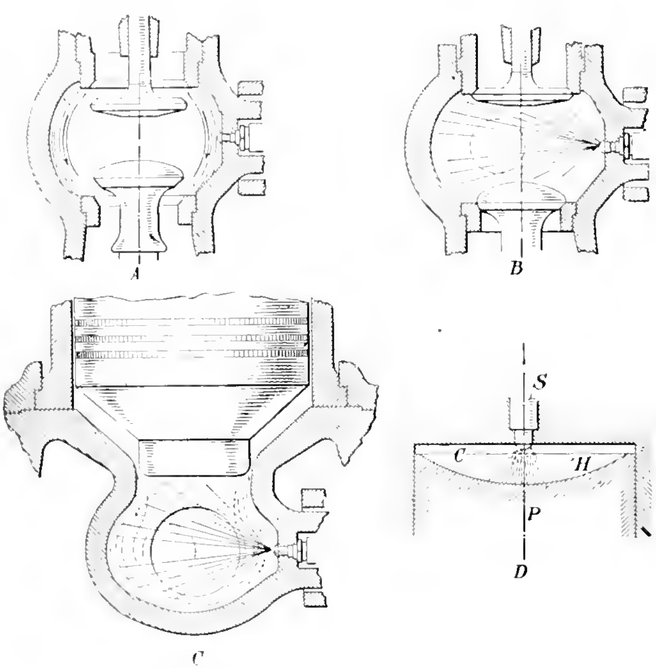

Fig. 7 Combustion Chamber in Crossley Heavy-Oil Engine

The theory underlying this construction is that a spherical chamber will give the least wall surface exposed to the water jacket, and will permit of a central core of air heated by compression and cooled as little as possible by contact with the walls. This core is relied on to fire the charge.

The change from spherical to spheroidal is rendered necessary by the cooling effect of the incoming charge of fuel which tends to transfer the central core towards the left, as indicated by the dotted circle in *C*. If the chamber were spherical this would bring it into contact with the water-cooled walls, but by making the chamber spheroidal a good clearance is provided between the hot core and the jacket. It is contended that this hot core is essential if a low compression pressure and low injection pressure are to be used, as it allows the fuel to be kept in contact with the heat for a longer period than would be the case in a Diesel engine. It is this feature that permits the Crossley engine to use a compression pressure as low as 300 lb. per sq. in. and a fuel injection pressure of only 1000 lb. with solid injection.

In order to further insure the thorough mixture of the air and fuel turbulence is produced by the shape of the top of the piston, which, at the top of the stroke, projects into the combustion chamber and forms a plug past which the air is driven at high speed by the rising piston round the walls of the chamber, but without disturbing the hot core, as shown by the dotted lines along the walls in Fig. 7, C.

Fig. 8 gives some test curves of the Crossley engine on various fuels, such as paraffin (kerosene), residual petroleum and tar oil. These figures were obtained from tests made by Professor Burstall on a single-cylinder engine 18½ in. bore by 28 in. stroke. The figure of 32.2 per cent thermal efficiency is unusual for such a simple single-cylinder engine.

The article also describes the governor gear of the engine. The governing of the engine is effected by the opening of a bypass or control valve *K*, Fig. 9, in the oil fuel pipe between the oil pump *J* and the oil sprayer at variable points in the pump delivery stroke, according to the load at which the engine is working. For instance, at medium load the control valve will be opened at about half-pump stroke, the remainder of the oil in the pump, instead of passing into the combustion chamber, being by-passed through the control valve *K* and pipe *T* to the funnel shown at *U* in Fig. 10, whence it flows back to the oil heater *V*. The means of operation of the control valve are shown in Fig. 9. The floating lever *F*, opposite the end of the control-valve spindle, is pivoted at its bottom end to an arm on the pump-lever spindle. The upper end of the lever *F* rests against a quadrant *H*, the position of which is controlled by the governor *G*. The quadrant has a cam-shaped periphery, and as the governor rises and falls the upper end of the floating lever is pushed to and fro in a direction toward or from the end of the control-valve spindle. When the pump plunger moves forward the upper end of the floating lever becomes the fulcrum of the lever, and the position of this fulcrum being shifted by the governor the control valve is opened at a varying time, according to the load and speed of the engine.

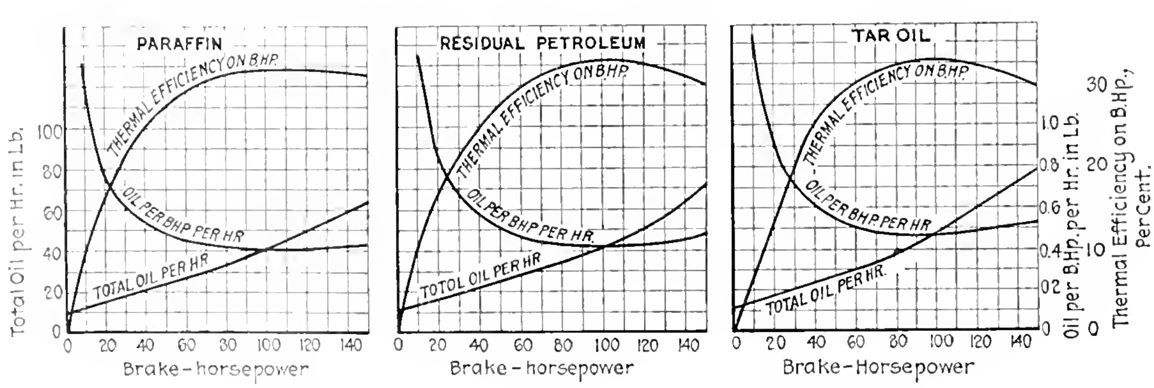

Fig. 8 Test Curves of the Crossley Engine on Various Fuels

When using viscous fuels which do not readily atomize at normal atmospheric temperatures a change-over fuel device is provided

to enable a less viscous fuel to be used for a few seconds or minutes when starting the engine. This change-over gear consists of an eccentric pin in the fuel pump placed between two suction valves and operated by the weighted hand lever shown at Y in Fig. 9. When this lever is in the position shown the lower valve is kept on its seat and a supply of less viscous fuel, such as paraffin, gas oil, or crude oil, poured into the cup X. When the engine is

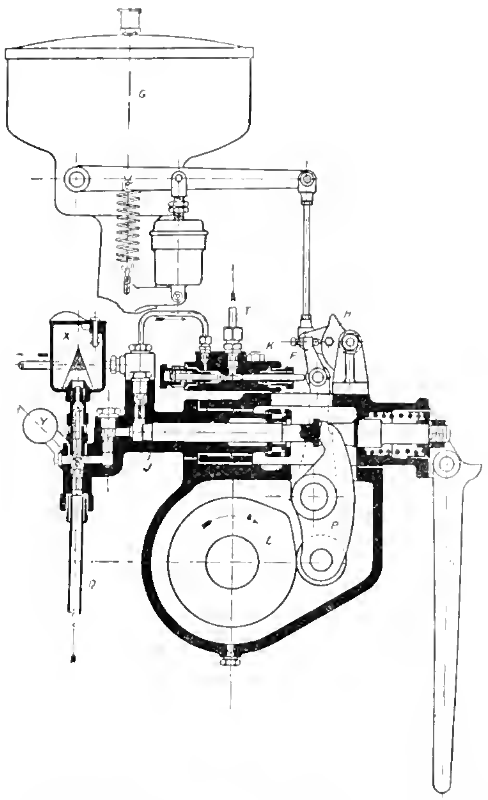

Fig. 9 Governor Gear of the Crossley Oil Engine

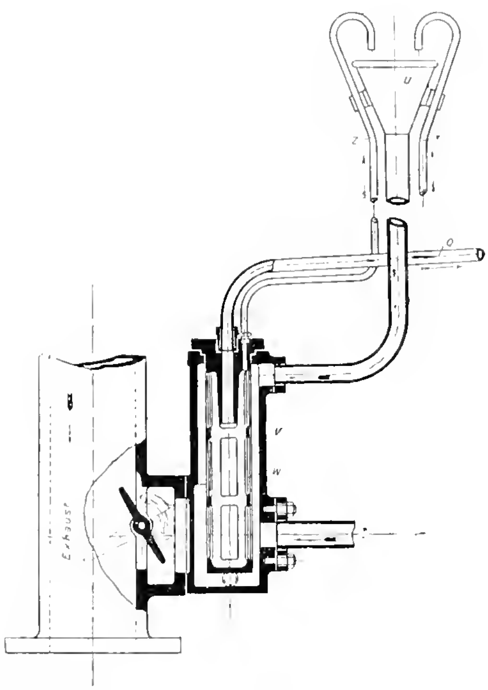

Fig. 10 Oil Heater of the Crossley Heavy-Oil Engine

started the pump will draw its supply from the cup. After a few revolutions the weighted handle Y is moved over, the upper valve being then closed and the lower valve opened, enabling the pump to suck its charges from the pipe Q, which is connected directly to the oil heater V shown in Fig. 10, through which the viscous oil is passed on its way from the oil tank to the pump to reduce its viscosity. The oil heater is attached to the exhaust pipe of the engine and the temperature of the heater can be adjusted by means of the large wing valve shown, which varies the amount of the exhaust gases which are allowed to pass through the connecting passages. A larger strainer W is fitted in the oil heater. In case any vapor is formed or frothing of the oil takes place in the oil heater, a vent pipe Z is fitted at the top of the heater and taken up to the top of the funnel, when any emission can readily be observed. A hand lever S is provided for filling the pump with oil before starting the engine.

To stop the engine a small screw-down valve is opened in the oil delivery pipe between the oil pump and the oil sprayer. The effect is to deliver all the oil to the funnel, and the combustion chamber being no longer supplied with fuel the engine immediately slows down and stops.

An interesting point is worthy of note in connection with the method of governing as described above, and this is that as the fuel, while being delivered, is actually producing power at that instant the cutting off of the supply of fuel at different points of the pump stroke, according to the position of the governor, means that the governing effect takes place at the identical moment that the fuel is being injected and burned, and therefore has an instantaneous effect between the fuel and the power. It is certainly a remarkable engine; it has the economy of many Diesel engines, and yet it has solid injection at low pressure and no air compressor; it has only 300 lb. compression pressure with the accompanying advantages of cheaper and lighter construction, and yet it can use the heavy oils, and it starts from all cold without the need for a lamp, and it should require only comparatively unskilled attention. (*The Engineer,* vol. 128, no. 3324, September 12, 1919, pp. 252-254, 5 figs., *d*)

Tractor Engines and Fuel Limitations, H. L. Horning, Mem. Am.Soc.M.E. Among other things the writer discusses the question of spark plugs, and gives the following specifications as to the location of the spark plugs and their design:

1 The plug should be located as near as possible to the center of gravity of the mixture in the combustion chamber when the mixture is about to fire
2 It should be so located as to be out of the exhaust-gas stream
3 It should be located so as to get the blast of this incoming rich mixture, or in such a place as will insure that the mixing surrounding this electrode will be highly explosive and not deadened by a residual charge
4 The cooling-water stream which has picked up a large volume of heat from the exhaust-valve environment usually insures temperature enough to keep a good clean plug and a cooling effect that will keep preignition out of the probabilities
5 No cylinder head should be designed which will demand a long spark plug to reach the mixture
6 A vertical spark plug is the only type which runs a long time without cleaning. The necessity of putting spark plugs at an angle if not horizontal in the head of a valve-in-head engine is one of the inherent defects of that type of engine. This is due to a cleaner oil drainage from the plug vertically placed
7 The plug should not be placed so as to get the direct sweep of gases passing by the piston and rings on the suction stroke.

The above considerations are particularly for the guidance of the engine designer. Beyond this he should keep in mind that the engine must work irrespective of where the farmer buys his plugs or their design.

Should the user desire advice as to the type of plug, it is only necessary to observe the following points:

1 The insulator should be of the best grade of porcelain or stone now available
2 The center electrode should be at least $\frac{5}{32}$ in. in diameter, well smoothed off, rounded, and the distance of its top

from the outside air a minimum. Cooling ribs are very desirable. No sharp corners or points should be presented to the combustion chamber

3 It is not easy to give general specifications for a good mica plug, although there are many. As a class they are to be avoided.

Aside from temperature problems the greatest difficulties with spark plugs arise out of the limitations of the fuel, resulting in a deposit of carbon. Excessive lubrication in the combustion chamber can result from heavy fuel and further favors the short-circuiting of the plug with oil and carbon. (*Journal of the Society of Automotive Engineers*, vol. 5, no. 3, September, 1919, pp. 265-271, 4 figs., *gp*)

Skew-Gear Type of Pressure Gas Turbine

Sanders Pressure Turbine. Essentially the turbine consists of two elements of a skew gear. At the points of mesh a tooth of one element in passing down the groove between two teeth of the other element is utilized as a constant-velocity piston traveling down the equivalent of a cylinder.

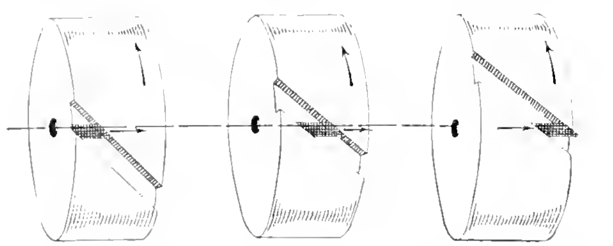

Fig. 11 Diagram Illustrating the Lateral Movement of Piston Tooth in a Diagonal Cylinder Slot of the Sanders Gas Turbine

Shrouding around these two elements allows a series of ports to be placed in positions which insure at various points of revolution, first, the admission of an explosive mixture under pressure; second, the uncovering of a small chamber containing a continuous sparking plug which fires the charge and, lastly, the emission of the exhaust gases (cp. Fig. 13 and discussion in a later part of this abstract).

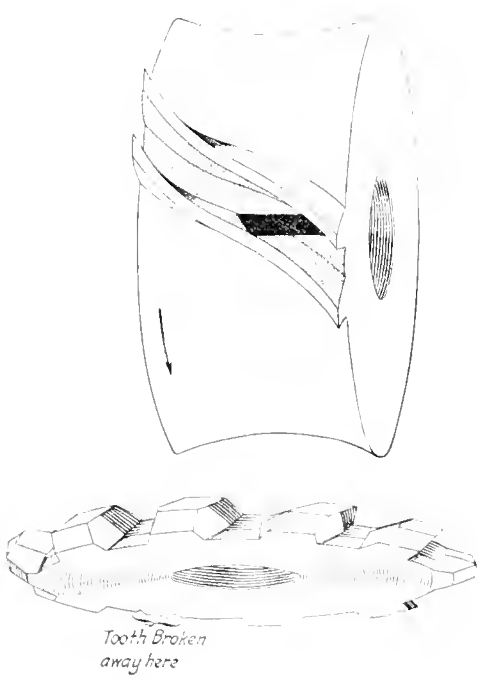

Fig. 12 Diagram Showing Relation between Skew-Gear Cylinder Wheel and Piston Wheel

This takes care only of two phases of the four-cycle system, namely, combustion and exhaust; and the experimental model receives its charge from an extraneous source, but it is intended to introduce a three-skew gear wheel into the train in order to provide for induction and compression within the turbine itself. No reciprocating parts or valves are necessary.

Fig. 11 gives a series of three diagrams, each of which shows a drum having a diagonal groove cut across its periphery. This groove forms three out of four walls of a rectangular-section "cylinder," the fourth wall being provided by a stationary casing or shroud around the drum not shown in the sketch. Within the cylinder groove appears a black diamond representing a piston free to move only in the direction of the dotted center line. The rotation of the drum in the direction of the arrow will cause the piston to travel across the face of the periphery, so that in moving from one side to the other it will travel down the length of the groove. If the drum be regarded as one skew gear wheel and the piston as one tooth on the periphery of a slice of a skew gear wheel, the principle of the turbine becomes clear.

Fig. 12 will help to understand it. It shows in the upper part between two teeth of one skew gear the groove forming a cylinder in which can be seen a piston consisting of a tooth broken off from the periphery of the thin skew gear shown in the lower part of the same figure. As the two gears shown in the figure are approximately correct in shape, it may be noted that the teeth of the "cylinder wheel" are not flat, but are hollowed with radii struck from the center of the "piston wheel" after the fashion of the Lanchester worm gear, which, with the slice form of piston, avoids the usual helical-gear clearance formulæ. This is, of course, essential to the turbine gearing, as the "piston-wheel" teeth must keep a gastight contact with the "cylinder-wheel" gears during the whole time of their meshing.

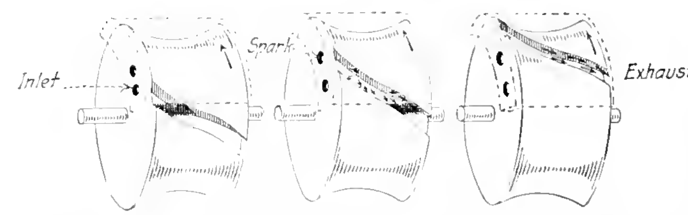

Fig. 13 Three Positions of the Piston Tooth and Cylinder Groove in the Sanders Turbine Relative to Ports in the Shroud at the Moments of Gas Admission, Firing and Exhaust

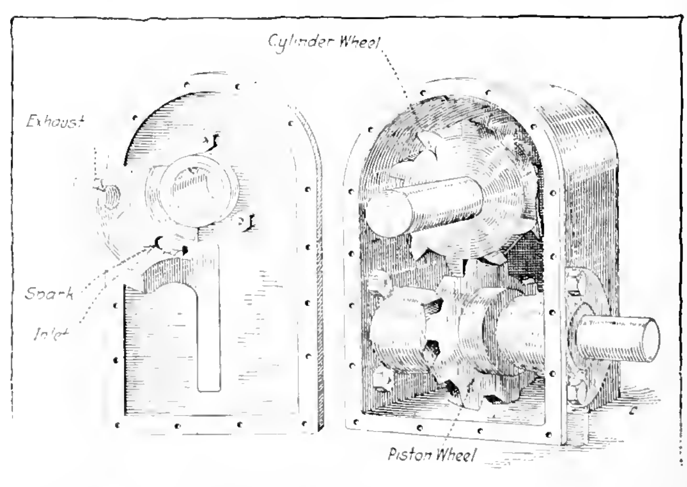

Fig. 14 Interior of Sanders Experimental Turbine (*right*) and Interior of the Cover and Shroud which fits into the Hollowed Periphery of the Top Rotor or Cylinder Wheel (*left*)

It is stated further that the piston wheel is purely an idler, and is not called upon to transmit any torque. Furthermore, when the

device is running, both the cylinder and the piston are in motion.

Fig. 13 shows the sequence of events in the power cycle. In this figure the periphery of the drum is hollowed out to the actual shape and the groove is given a semblance of its correct form.

In the first of these diagrams the left-hand end of a cylinder groove, after its piston has just entered, is opposite the inlet through which gas mixture under pressure is entering. Further rotation of the cylinder groove causes the latter to pass by and cut off the inlet, then to uncover the second port in which a constant spark is taking place. This position is shown in the second diagram. The explosion takes place, and the cylinder groove, after further rotation, is deserted by the piston and the exhaust gases are free to escape as in the third diagram.

The following are given as trial runs of the experimental model. Air pressure at 40 to 50 lb. per sq. in. was obtained from an outside compressor and the air before being drawn into the compressor obtains the necessary amount of gasoline in its passage through the carburetor. When the air compressor was turned on to the turbine the latter maintained a speed of about 1000 r.p.m. The instant, however, that the ignition was switched on the speed jumped to 4000 revolutions, accompanied by a roar of explosions from the exhaust pipe. No brake-horsepower tests were performed in the presence of the author.

For cooling, a small power blower passed a blast of cool air directly on the grooved wheel.

In the article is included a report by W. Morgan, professor of automobile engineering, University of Bristol, in which it is estimated that a unit with the 5.5-in. cylinder wheel and two piston wheels should be capable of developing 36 hp. at a speed of 10,000 r.p.m., and it is believed that far higher speeds are possible.

In view of these statements Fig. 14, showing the interior of the Sanders experimental turbine, may be of interst. (*The Autocar*, vol. 43, no. 1245, August 30, 1919, pp. 317-320, 8 figs., *d*)

Heavy-Fuel Carburetor-Type Engines for Vehicles, J. H. Hunt. The article discusses the combustion of heavy fuels, meaning thereby fuels of higher vaporization point than gasoline in engines of constant-volume type, and calls attention to two important facts:

First, the problems of carburation and distribution can hardly be separated. Further, when the mixture finally reaches the cylinder the heavy fuels do not burn in the same manner as the lighter hydrocarbons, and under certain conditions exceedingly severe knocking takes place. Investigation has shown that this knocking is due to the momentary existence of exceedingly high pressures in the engine.

The writer states experience has shown that it is possible to handle a wet mixture in an air-cooled, single-cylinder engine running under steady load conditions, which indicates that a high temperature in the combustion chamber will take care of the effects of previous lack of vaporization, and will tend to prevent the condensation and deposition of fuel.

On the whole, the author expresses the belief that so far no means have been shown by which the heavy-fuel carburetor engine will improve the fuel situation to any great extent. The equipments which have shown promising results in service have handled nothing heavier than kerosene, and at present only half as much so-called kerosene as gasoline is being produced. (*Journal of the Society of Automotive Engineers*, vol. 5, no. 3, September, 1919, pp. 202-207, *g*)

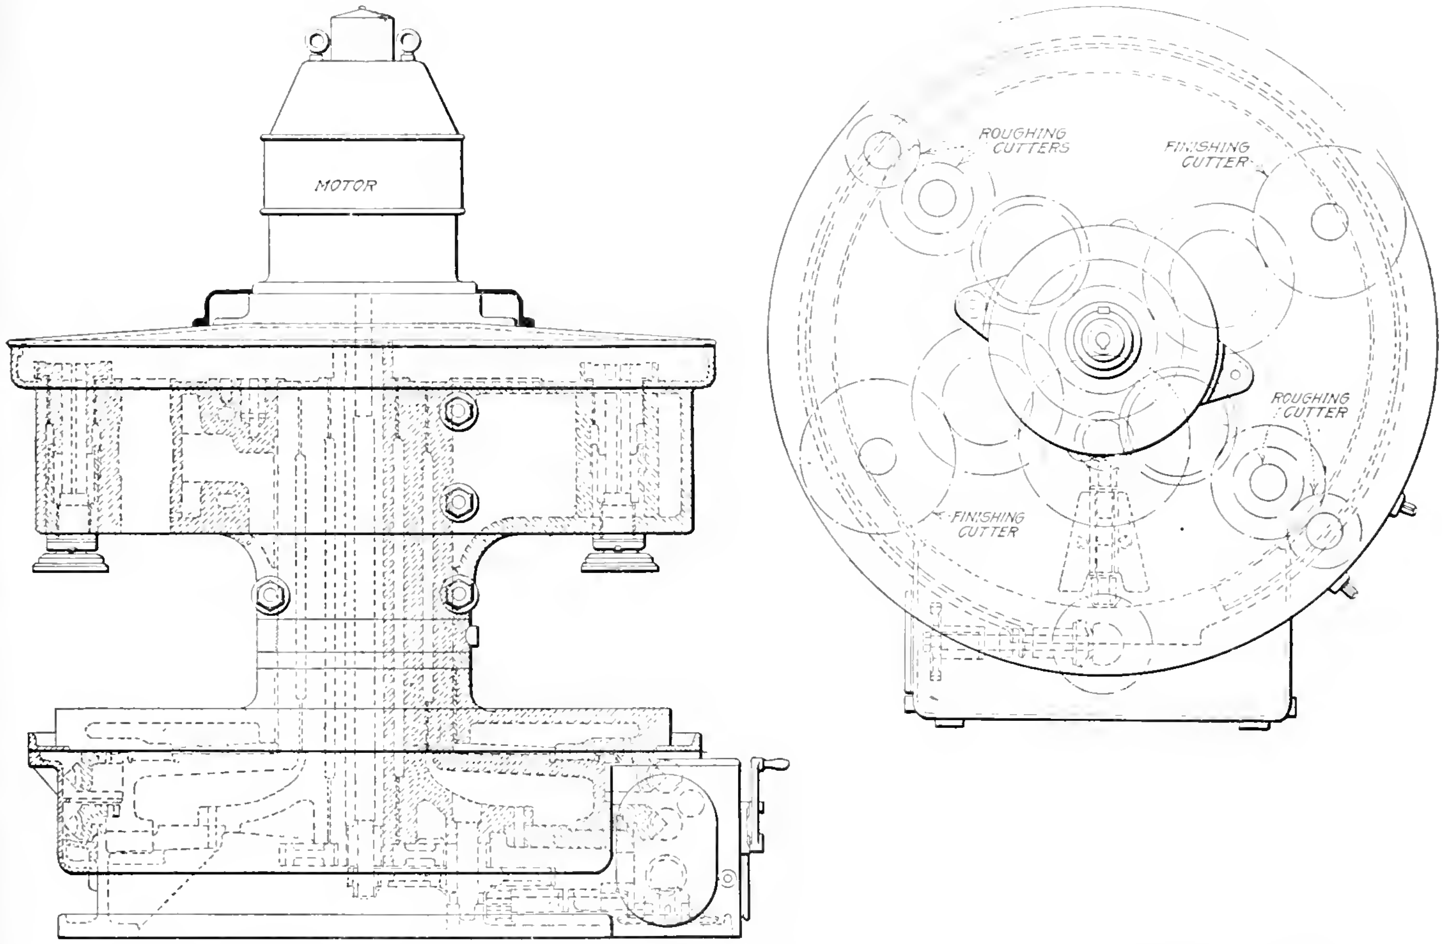

Fig. 15 Ingersoll Differential-Type Continuous Milling Machine (Sectional View of the Main Working Parts)

MACHINE TOOLS

Ingersoll Differential-Type Continuous Milling Machine, J. V. Hunter. Description of a new machine built by the Ingersoll Milling Machine Co. of Rockford, Ill., and designed essentially for

continuous milling operations. It is so built that it may have a multitude of working stations, but has only one loading and unloading station, so that only one operator is required to control all of its motions and results.

The main parts of the new machine are (Fig. 15) the lower or work-carrying table and the head carrying the milling-cutter spindles. Both of these revolve in the same direction, which accounts for the use of the term "differential" in the name of the machine. The difference is in the relative speeds of the two parts, and it constitutes the rate of feed of the cutter across the face of the work.

Vertically through the center of these two revolving parts is a large column about which the work table rotates and which, in its turn, carries and drives the heavy spindle head. The head carries a number of spindles, this number varying with the character of the work for which the machine has been planned, and is always one less than the number of work-holding fixtures which are carried upon the table. This permits the cutter spindles to be continuously operating at all times upon work, yet leaves one fixture idle at the loading station, which permits the operator to remove or replace work in this fixture before it travels around into a working position.

The entire upper structure or spindle head rotates toward the left of the operator as he faces the machine. The table carrying the work at the same time rotates in the same direction, but at a slightly lower rate of speed, so that the cutter spindles gain upon it at an average rate of 15 in. per min. at the average center of the work, which has been determined upon as the proper rate of feed for the job under consideration. The relative motion of the spindle head and work table are so timed that when the work table has made one complete revolution the spindle head has gained upon it a sufficient distance to carry one spindle completely across the face of the work. Because of this, normally a casting which was placed in any one fixture is, when returned to the loading station at the end of a complete revolution, entirely machined and ready for removal from the table.

The original article describes and illustrates some of the fixtures used in the machine.

The power drive is by a vertical electric motor mounted above the center of the machine. This feature permits the drive shaft to extend through the center of the column to the base below and saves floor space.

The number of the spindles on the machines so far built varies from four to seven. Regulation of the height of the spindles for the varying depths of cut is obtained by means of standard Ingersoll quills which extend through the housing near the base of a spindle. These permit the operator to alter the depth of cut at will be compensate for the wear or regrinding of any or all sets of cutters. Each spindle is provided with its individual attachment of this character.

One of the features to which particular attention is called in the original article is the absence of any necessity on the part of the operator of attending any station other than that which has been called the loading station; that is, the one where the work is put in and removed. (*American Machinist*, vol. 51, no. 14, October 2, 1919, pp. 645-650, 6 figs., *d*)

POWER PLANT ENGINEERING

ATMOSPHERIC POLLUTION FROM THE ENGINEER'S STANDPOINT. John B. C. Kershaw. The present article is based on the fourth report of the Advisory Committee attached to the Meteorological Office, dealing with the results obtained by the observations of atmospheric pollution in London, Manchester, Glasgow and other towns in the years 1917 and 1918.

An interesting point of view from which atmospheric pollution is considered is that of the degree to which it affects boiler feedwater, the opinion of the writer being that through air pollution dissolved impurities are traced into the rain water in the neighborhood of towns and cities and that ultimately this water gets into the boilers and produces quite undesirable results.

The general use of higher temperatures and pressure in steam boilers than was customary a few years ago renders it imperative that much greater care should be given to the purity of the water supply.

The data reported for the years 1917 and 1918 are compared by the writer with data previously published for pre-war use. A comparison of these data shows that there has been a nearly universal increase in the pollution of the air in the war period.

Of the materials found in rain water, tar, ash and some of the carbonaceous matter are insoluble, while other carbonaceous matter, chlorides, sulphates, ammonia and soluble ash are soluble. There have been found some variations between the amount of impurities in various English towns and also seasonal variations, the latter being particularly noticeable in the London group. (*The Engineer*, vol. 128, no. 3322, August 29, 1919, pp. 197-198, *p*)

SKIMMER IN 800-HORSEPOWER BOILER. Description of a baffle arrangement used by the Indianapolis Light and Heat Company to prevent particles of suspended matter from being carried over into the header with the steam by particles of water.

Before the skimmer was installed the company had a good deal of trouble because the feedwater was passed through water softeners and on coming out contained a quantity of suspended matter.

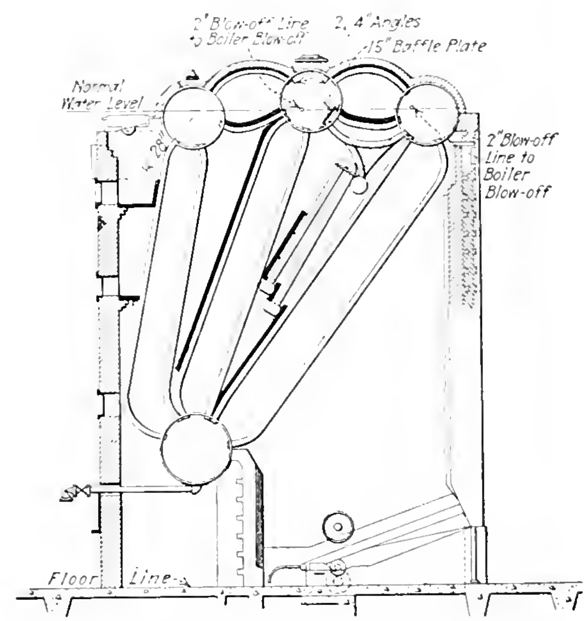

FIG. 16 BAFFLE SKIMMER FOR ELIMINATING SUSPENDED MATTER IN BOILER

When the boilers were operated at high rating particles of this suspended matter were carried over, causing a decrease in superheat and clogging up the lines and turbine blading.

The arrangement adopted is shown in Fig. 16. Two 4 x 4 in. angle irons were placed lengthwise in the middle steam drum, just above the steam-circulating tubes. In addition to this one No. 12 sheet-iron baffle 15 in. wide was installed lengthwise in the middle steam drum. It is 14.5 ft. long, and so located that it breaks the force of the water entering from the front drum, while the other angle irons check the upward rotation of water within the drum.

A 2-in. blow-off line is installed just below the normal water line in both the middle steam drum and the front drum. These blow-off lines run the length of the drum and are led into the boiler blow-off lines, valves being provided for their control.

It is stated that the device costs only a few dollars to install and does away entirely with the trouble previously experienced. (*Electrical World*, vol. 74, no. 11, September 13, 1919, pp. 581-582, 1 fig., *d*)

POWER TRANSMISSION

Converting Machines to Individual Drives. Description of methods used in converting a plant doing electrotyping on a large scale.

One make of motor and one speed (1800 r.p.m.) were used in order to realize the advantages of interchangeability and standardization, the motors being of the two-phase 220-volt type. Belt transmission between motors and driven machines was employed.

The article is of interest in that it describes in some detail and illustrates the way the various drives were installed and also gives a table showing the rating of motors driving electrotyping machines. (*Electrical World,* vol. 74, no. 12, September 20, 1919, pp. 637-640, 2 figs., *dp*)

REFRIGERATION

Test of a 2-Ton Clothel Refrigerating Machine, M. C. Stuart, Mem.Am.Soc.M.E. Data of a test recently conducted at the U.S. Naval Engineering Experiment Station at Annapolis.

The refrigerating medium in this machine is ethyl chloride, C_2H_5Cl, a neutral chemical having a boiling point of 54.5 deg. fahr. at atmospheric pressure. The unit consists of a motor-driven rotary compressor, a condenser, separator, expansion trap and brine cooler.

The construction of the rotary compressor is shown in Fig. 17. The rotor is located eccentrically in the cylinder, which is bored elliptically on a special machine. The top of the rotor makes contact with the top of the cylinder, thereby forming a seal between the suction and pressure sides of the cylinder. The blades are fitted into four slots milled radially in the rotor, and into the outer edges of the blades are fitted half-round packing strips which are machined to conform to the inside of the cylinder. The blades and packing strips are held out by spacing pins which pass through the center of the shaft. The seal between blade and cylinder wall is therefore positive, and contact between blade and cylinder wall does not depend upon springs or upon centrifugal force acting on the blades. The rotor is keyed to the steel shaft, which is carried on ball bearings mounted in the cylinder heads. The apparatus is lubricated by chemically pure glycerine passed through a glycerine strainer.

The original article shows the arrangement of the refrigerating apparatus. From the compressor the refrigerant in the form of gas flows to the condenser, this latter consisting of U-tubes arranged in two passes with condensing water flowing through the tubes. After being condensed the liquid refrigerant, together with the lubricant, flows into the separator where the lubricant, being heavier than the refrigerant, is drained back to the compressor and the liquid refrigerant is led to the expansion trap. From there the refrigerant passes to the brine cooler, the construction of which is similar to that of the condenser, the refrigerant being in the shell and the brine passing through U-tubes arranged in two passes. In the brine cooler the refrigerant is vaporized by the heat which is abstracted from the brine and in the form of a vapor passes to the compressor where the cycle of operations starts over again.

The principal results obtained on the test are given in a table, from which it appears that the refrigerating effect is increased with higher brine temperatures and lower circulating water temperatures. With a circulating water temperature of 70.1 deg. fahr. and a brine temperature of 14.57 deg. fahr. the net refrigerating effect was 2.13 tons per day. (*Journal of the American Society of Naval Engineers,* vol. 31, no. 3, August 1919, pp. 624-634, 6 figs., *dt*)

Testing and Measurements

Notched-Bar Tests, Dr. W. C. Unwin. Discussion of some of the questions bearing on the subject of the title of the article, with special reference to the Report of the Committee on Impact Tests of the British Association (Report for 1918, page 17 et seq.)

On the basis of this report, and other data, the author points out that the results of tests on a given material vary with the size of the test bar. Because of this, if notched-bar tests could always be made on bars of the same dimensions the work of fracture per square centimeter of the section of the notch would be a sufficient practical guide to the quality of the material; but actually it is not possible to test different materials in different cases with bars of uniform size, which makes the results not directly comparable.

Furthermore, the author shows that the work of rupture is not proportional to the volume of the bar. The ratio of the resistance of different sizes is up to the present undetermined and tests on bars of different sizes cannot be compared. In this connection the writer complains that the ratios of kilogram-meters per square centimeter obtained for different materials for each pair of testing machines are so divergent in published report of tests, including the British Association report, that often it is impossible to make anything out of them.

Quoting the empirical formula of reduction for notched-bar tests given by Charpy and Thenard, the author adds the following:

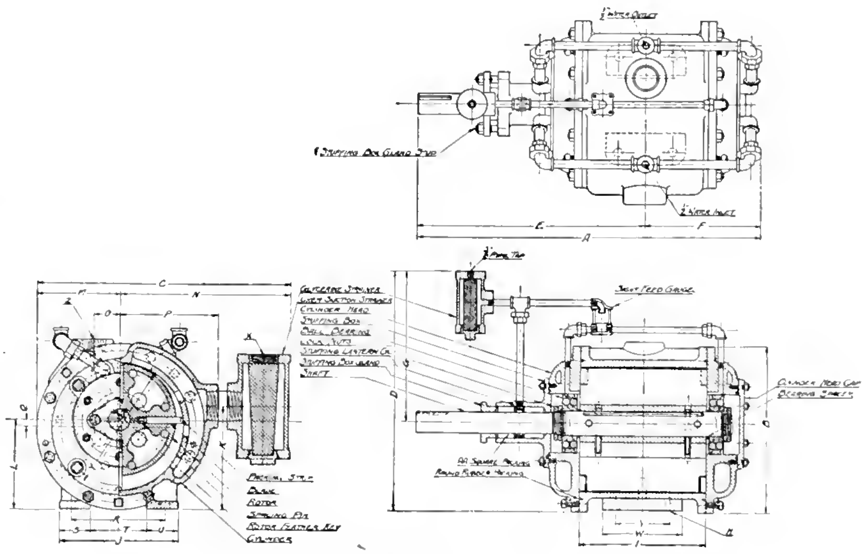

Fig. 17 Rotor Compressor of the Clothel Refrigerating Machine

"It has been remarked that an empirical formula which agreed with a series of experimental results, might give some indication of the direction in which a rational law should be sought. It has been alleged that the constant required in reducing the notched-bar tests must have the dimensions of work divided by volume. Now, Charpy and Thenard's bars were geometrically similar, and if the above statement is true, the work of rupture should be proportional to the cube of homologous dimensions, or to $a^{1.5}$. According to the tests, this does not seem to be the case." (*Engineering,* vol. 108, mp. 2802, September 12, 1919, pp. 329-320, *tA*)

CLASSIFICATION OF ARTICLES

Articles appearing in the Survey are classified as *c* comparative; *d* descriptive; *e* experimental; *g* general; *h* historical; *m* mathematical; *p* practical; *s* statistical; *t* theoretical. Articles of especial merit are rated *A* by the reviewer. Opinions expressed are those of the reviewer, not of the Society.

A bill has recently been proposed in the United States Senate whereby jurisdiction is extended to the several courts of the United States sitting in admiralty, to hear and adjudge suits for damages brought by the owner of any vessel or cargo for loss, damage or injury to property, due to the fault of any vessel owned or operated by the United States or by a corporation in which the United States is the controlling stockholder. These courts are to enter a decree in a proper case against the United States for the amount of loss, damage or injury, together with interest at four per cent and costs.

MECHANICAL ENGINEERING
THE JOURNAL OF THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS

Published Monthly by the Society at
29 West Thirty-ninth Street, New York

As already announced to the readers of Mechanical Engineering, the printers' strike in New York has closed all the union printing plants of the city, the daily newspapers excepted, and has resulted in a complete tieup of the printing industry in this, the largest publishing center of the country. In this emergency Mechanical Engineering is being printed temporarily in another city, but will not arrange for permanent publication outside of New York unless a situation develops not yet anticipated.

As the most practical method of handling its publication, the "Society Affairs" material for November, usually contained in Section Two of Mechanical Engineering, was printed separately in a third place and mailed to the entire A.S.M.E. membership and to the subscription list early in the month, in order to give prompt service to those interested in the Employment Bulletin and in Society announcements. Following this the Technical Section is now issued at as early a date as could be arranged, and, although curtailed somewhat in extent and variety of contents, brings to its readers a selection of the papers to be presented at the Annual Meeting of the A.S.M.E., together with the usual Engineering Survey, Engineering Index and miscellaneous matter.

Congratulations to Western Society of Engineers

The Western Society of Engineers, with headquarters at Chicago, has just completed a successful drive for membership, resulting in 2000 new members. One hundred and fifty workers were enlisted to put the drive across, divided into ten teams, each with a captain and nine solicitors. That there might be no duplication, each team was given a definite list of names to work upon. There was the greatest rivalry between teams and enthusiasm was manifest throughout the undertaking.

The Western Society was organized in 1869, and though mainly devoted to the interests of one section of the country, as designated by its name, it actually has a membership throughout the nation and in several foreign countries. The engineers of Chicago are fortunate in having so strong and long-established a body through which to coördinate their interests, and the society is to be warmly congratulated on this, its fiftieth anniversary.

Mid-West Sections Meeting of The American Society of Mechanical Engineers

An innovation in the development of the sections' activities of The American Society of Mechanical Engineers was carried out at Indianapolis on October 24 and 25 when the members of the Society gathered for a two days' session under the direction of eight sections of the Society. The Indianapolis Section handled all of the details for the social side of the program, and the seven other sections were invited to contribute papers to the professional program. This secured a wealth of papers on the two topics covered by the meeting, the first of which was devoted to Industrial Unrest and the other to Research.

Recognizing the importance of meetings of this kind in the development of the Society, the Council contributed by holding its October meeting at Indianapolis and participated in several features of the program.

At the opening session Friday afternoon, Dean Charles Russ Richards, of the University of Illinois, presided. W. C. Rogers, Manager of the Employers' Association of St. Louis, opened a discussion on Industrial Unrest, with an analysis of the causes and remedies for the existing conditions. Adequate wages for employees, adoption of measures for their health and for recreational facilities, and the Americanization of foreigners, among other points, were urged by Mr. Rogers.

A paper prepared by C. F. Scribner, consulting engineer of Chicago, was presented by Arthur L. Rice, Chairman of the Chicago Section. It urged that the piece-work system be placed in operation only after thorough investigation to determine a just scale and to insure that rates would not be revised without a change in the conditions forming the basis on which they were first established.

Results of the Americanization Program Carried Out by the Commonwealth Edison Company of Chicago was the title of a paper presented by A. D. Bailey, Assistant Chief Engineer of that Company, who discussed the Americanization of foreigners by means of primary education in our language and methods of government.

Dean J. A. Watkins, Director of the Department of Industrial Medicine of the University of Cincinnati, described the work undertaken in the study of industrial disease.

Intensive Manufacturing Methods, together with the Proper Training of Men toward Organization, was the text of an illustrated address by Prof. B. W. Benedict, Manager of the Shop Laboratories of the University of Illinois.

Following a banquet in the evening, Charles F. Coffin, President of the Indianapolis Chamber of Commerce, welcomed the visitors and Dean M. E. Cooley, President of The American Society of Mechanical Engineers, responded. After this an unique and interesting address was given by Dr. Willis A. Moore of Detroit, Mich., who is now devoting his time to addressing the workers in various manufacturing plants, inculcating a spirit of true Americanism, a desire for closer relationship between capital and labor and an understanding of the reasons why increased production is essential at the present time. Dr. Moore stripped off his coat and collar, actually, not figuratively, and made his talk a realistic reproduction of a noon-day shop meeting, such as he addresses from day to day.

The session on Research, at which Prof. Arthur M. Greene, Jr., presided, brought forth a number of excellent papers.

C. F. Hirshfield, Director of the Research Department of the Detroit Edison Company, opened the session with a statement of the Present Status of Research in the Industrial Life of the Country, and pointed out the necessity of the attention to the problems of finance, distribution and utilization of products, as one means of stabilizing industrial conditions.

The Administration of Industrial Research Affairs was presented by R. E. Carpenter, Director of the Research Department, Aluminum Castings Company of Cleveland.

L. G. Robinson, of Cincinnati, spoke on Coöperative Industrial Research and Dr. E. P. Hyde, Director of the Nela Park Laboratories, described the work done there.

A paper on the Fatigue of Metals Phenomena was read by Prof. H. F. Moore, of the University of Illinois, who had with him a reel, showing by motion pictures in detail the effect of stress of steel.

Dean C. H. Benjamin described the tractor testing plant at Purdue University and Mr. L. C. Nordmeyer read a paper on Research, prepared by W. G. Hessenbruch of St. Louis.

Dean J. R. Allen, Director of Research for the American Society of Heating and Ventilating Engineers, completed the program with a paper on Pure Science and Engineering Research.

At the completion of the professional portion of the program the members enjoyed an automobile trip to the Indianapolis Canoe Club for luncheon, going later to the Aviation Repair Depot and the speedway flying field, where exhibition flights were made.

Transactions of the A. S. M. E.

Volume 40 of the Transactions of The American Society of Mechanical Engineers has been issued to the membership. The volume comprises forty-four papers and discussions on a wide variety of mechanical engineering and industrial economic subjects; two reports by committees of the Society—one on the metric system and export trade and the other on the standardization of flanges and pipe fittings; and a comprehensive symposium on the economical use of fuel, occupying practically one-sixth of the book and forming a consensus of the experience of a large number of engineers, contributed in the interests of the national fuel-conservation program. A number of the industrial papers relate to problems brought to the fore by the exigencies of the war.

One group of papers deals with thread gages and with the work thereon of the British Engineering Standards Association, while another takes up problems involved in the employment of labor. Other subjects considered in the remaining papers are management, power-plant topics, aeronautics, weights and measures, foundry costs and accounting, factory construction, internal-combustion engines, refrigeration, mechanics, textiles, etc.

The preparation of the volume has been carefully supervised by the Publication Committee of the Society, and special pains have been taken in the selection, arrangement and indexing of the material to make it of the greatest possible reference value.

The American Air Race

During the month, as part of the experimental program carried on by the War Department, an air race was conducted between Mineola, Long Island, and San Francisco, the conditions of the race being that each of the fliers had to start from and get back to one of these terminal points. Only military fliers were permitted to participate, various machines, American and foreign, being used.

Although at this writing only fragmentary data are available, a few facts nevertheless stand out. Several fliers have completed the circuit either from Mineola to San Francisco and back, or from San Francisco to Mineola and back, which shows that machines can be built to stand a 7000-mile trip under comparatively unfavorable weather conditions.

Another lesson of the flight is the apparent unsuitability of the DeHaviland-4 machine for long-distance flying and its lack of safety. In several accidents pilots were killed under conditions which indicated that had the accident occurred in a different machine, such as, for example, the DeHaviland-9, the pilots might have escaped with only minor injuries.

The most important and, to those who are familiar with the conditions of aviation service in this country, by no means unexpected lesson of the flight lies in its showing once more the high average of the human material in the service. The flight took place under more than usually unfavorable weather conditions. The qualities of the machines were well-known. There were no great prizes offered, and the men flew and took great and well-recognized risks, simply as part of the day's work. The large number of men who volunteered for the race showed a quite exceptional average of skill under very adverse conditions.

There is no question but that the American army possesses as fine human material for the upbuilding of its flying branch as could be desired, and it only needs that the mechanical equipment of the service be brought to the same standard.

The Engineering Index for 1919

Although the annual volume of the Engineering Index has heretofor been based upon the classified system, it has long been the opinion of many who use the index that a strictly alphabetical arrangement would greatly enhance the value of the volume. Accordingly the items which form the 1919 Engineering Index will be alphabetically arranged, with liberal cross-references provided.

The 1919 Index, published by the American Society of Mechanical Engineers, will be a volume of approximately 500 pages and will contain over 12,000 references to engineering literature of the current year. These references have been selected from over 1100 periodicals which are regularly received by the library of the United Engineering Societies, and which represent the leading literature of the engineering profession both in this country and abroad.

On account of the difficulties in the printing industry, no definite announcement can as yet be made concerning the date of publication, but it is hoped that the book will make its appearance early in the coming year, and as soon as possible further details will be announced.

Dedication of Pittsburgh Station Bureau of Mines

The new buildings of the Pittsburgh Station, U. S. Bureau of Mines, were formally dedicated on September 29 and 30, and October 1, under the auspices of the U. S. Government, the State of Pennsylvania and the city of Pittsburgh, the Chamber of Commerce coöperating.

The station at Pittsburgh, with its spacious buildings, its museum, and its many laboratories and offices, is the largest of the eleven experiment stations of the Bureau distributed throughout the country, and is of particular interest to mechanical engineers because of its fuel laboratory, constituting as it does one of the two Government laboratories for the investigation of mechanical engineering problems, the other one being the Naval Experiment Station at Annapolis. This, of course, is excluding the specialized work of the Government in aircraft and in connection with the physical laboratories at the Bureau of Standards.

While the Bureau of Mines is engaged primarily in mining problems, and particularly those relating to mine safety, a large and important part of its work is concerned with the problem of obtaining greater efficiency in the burning of coal. The Bureau has been the pioneer in combustion experiments in the United States and has issued many reports on this subject familiar to engineers.

The fuel laboratory at Pittsburgh is splendidly equipped and more apparatus of commercial size will be added in the near future. Extended experiments in the transmission of heat through boiler tubes and furnace walls are under way, and it is here that the research work lately instituted by the American Society of Heating and Ventilating Engineers is to be conducted with respect to systems of heating, radiation constants, air standards based on humidity, etc.

At the dedication of the Pittsburgh buildings there were opening exercises at which Governor Sproul of Pennsylvania was the principal speaker; a reception by Dr. Manning, Director of the Bureau of Mines, and Mrs. Manning; a pageant glorifying the mining industry; and a dinner given by the Chamber of Commerce. During the three days of the celebration demonstrations were made of coal-dust explosions and there were mine-rescue and first-aid contests by teams from different states.

TECHNICAL PAPERS TO BE PRESENTED AT THE A. S. M. E. ANNUAL MEETING

IN this and the last number have been printed extended abstracts of several of the papers to be presented at the coming Annual Meeting of the A.S.M.E., and there are given below very brief summaries of a larger list of these papers than it has been possible to incorporate in these two last numbers of MECHANICAL ENGINEERING. These papers are available in pamphlet form for distribution to the members of the Society in advance of the meeting, which occurs December 2 to 5. Members wishing copies should notify the Secretary of the particular papers desired and pamplets will be forwarded promptly.

COMMON ERRORS IN DESIGNING AND MACHINING BEARINGS, by Christopher H. Bierbaum. In this paper the author discusses such matters as oil grooves and their proper distribution, the disadvantages of tight-fitting bushings, proper methods of finishing brasses to provide for expansion when running, and proper methods of clamping bearings while they are being machined. He also shows by means of photomicrographs of finished surfaces the importance of using sharp tools with the proper rake in order that the crystalline structure of the surface material of the bearing may not be so crushed and compacted that it will fail to function as a normal bearing alloy.

TURBO-COMPRESSOR CALCULATIONS, by Allen H. Blaisdell. A paper dealing at length with the thermodynamic and pneumatic principles involved in the operation of a turbo-compressor, and including in its treatment a study of the nature of compression, and the layout of a compression diagram, the theory of fluid flow, essentials of impeller and diffuser design, and considerations regarding power consumption and efficiency.

THE HVID ENGINE AND ITS RELATION TO THE FUEL PROBLEM, by E. B. Blakely. This paper describes a type of engine, the Hvid, which it is claimed has all the advantages and none of the disadvantages of the so-called Diesel type, and which is being produced in units as small as 1½ hp. It can be started cold. It has no complicated air-compressor systems and is said to be so economical that it can compete with gasoline engines of the same size. The author outlines the operation of the engine, describing in detail the suction, compression, power, and exhaust strokes, and presenting a series of indicator cards. Fuel consumption is shown by means of a series of curves obtained as the results of tests performed. The paper concludes with a discussion of the heat balance and torque characteristics of the engine. It is pointed out that there are certain characteristics of the engine which ought to attract internal-combustion engineers to its study to the end, perhaps, of perfecting it and thus assisting in solving some of our fuel problems.

EMERGENCY FLEET CORPORATION WATER-TUBE BOILER FOR WOOD SHIPS, by F. W. Dean and Henry Kreisinger. This paper describes tests upon the standardized water-tube marine boiler designed by the United States Shipping Board, Emergency Fleet Corporation. Of the 1352 ordered, the first 706 were alike. The other 646 were ordered with slight changes including the use of four passes instead of three passes embodied in the original lot. In view of the large number of boilers needed, the scarcity of steel and the desire to secure competitive prices, the water-tube type was adopted instead of the Scotch marine type. This made it possible to have the boilers constructed in inland shops throughout the country and effected a reduction in the weight of steel of more than 9,000,000 lb. for the total order. The boilers had a grate area of 65.54 sq. ft., heating surface of 2500 sq. ft. and a commercial hp. of 135 on the basis of the marine rating of 6 lb. of water to a sq. ft. of heating surface per hour. Under test the three-pass type showed at first an efficiency of 69 per cent which was later raised to about 73 per cent, based upon combustible, by certain changes which were effected. The four-pass type exceeded 74 per cent on two tests. These results were obtained when the boilers were hand-fired. Subsequently an investigation was made by Mr. Henry Kreisinger of the Bureau of Mines of the mixture of air and combustible in the furnace and of the temperature of the gases, details of which are given in the text together with tables showing the complete results of the evaporative tests.

FLOW OF WATER THROUGH CONDENSER TUBES, by William L. De-Banfre and Milton C. Stuart. This paper is the result of a series of tests which were conducted at the United States Naval Engineering Experiment Station at Annapolis, Md., to determine the friction loss of water flowing through ⅝-in. standard condenser tubes of No. 18 gage. The investigations covered variable velocities, water temperatures, and tube length, as well as the effect of both fresh and salt water. The computations were made in such a manner that the various losses could be separated and the results have been expressed in a general formula.

WAGE PAYMENT, by A. L. DeLeeuw. A paper which discusses the various items entering into the present relations between employer and employee. The author first calls attention to the fact that some of the terms which are most commonly used are not clearly understood. Among these are "capital," "labor," "right to organize," "collective bargaining," and "wage." He accordingly discusses each, and then takes up the subject of the various systems of payment in existence at the present time. Taking the aims of the organized labor to be: (1) proper share of the proceeds of labor, (2) reasonable working conditions and working hours, (3) right to organize, and (4) collective bargaining, the author believes that these aims could all be accomplished without strife if collective bargaining were put into actual practice instead of being a mere catch word. In conclusion he states that in his opinion the real cause of the current unrest lies in the fact that our present wage system is not based on knowledge and justice, but only on guess work and on the fear that the one of the parties concerned may "do" the other.

SLOW-SPEED AND OTHER TESTS OF KINGSBURY THRUST BEARINGS, by H. A. S. Howarth. This paper presents operating and experimental data which show the wide range of application of the Kingsbury thrust bearings. The author describes typical installations of bearings which have been in successful operation since 1911. The Kingsbury thrust bearings have been applied to vertical and horizontal hydroelectric units, to horizontal steam turbines and to centrifugal pumps, and to determine some of the service conditions, a series of slow-speed tests were made, details of which the author presents in his paper. The results of these tests indicate that the lower the speed at which the bearing is run continuously, the better the conditions of bearing surfaces. Speeds as low as 0.38 r.p.m. have thus far been employed, using, however, only a light oil.

A PERFECTED HIGH-PRESSURE ROTARY COMPRESSOR, by Chester B. Lord. A paper giving particulars of an improved rotary compressor of the eccentric-rotor and telescopic-blade type, in which leakage, friction, and packing troubles have been overcome to such an extent that a volumetric efficiency of 92 per cent at seven compressions (100 lb. per sq. in.) is said to be commercially obtainable. This compressor, it is stated, will handle gas, air or liquid, or all three, without adjustment or alteration, and a single-stage machine will compress to a pressure of 500 lb. per sq. in.; further, it is possible to compress to 1000 lb. in three stages with the three units on the same shaft.

MODERN ELECTRIC-FURNACE PRACTICE AS RELATED TO FOUNDRIES IN PARTICULAR, by W. E. Moore. In this paper the author, after first giving particulars regarding the operation of acid and basic furnaces, enumerates the superior properties of electric steel, and the advantages of the electric furnace over the open-hearth method. Crucible and converter processes are next briefly mentioned, the author pointing out the superior characteristics of the acid type of furnace for foundry work. To set forth the marked economy of the electric furnace, comparative operating costs of producing liquid steel both by the converter and the electric-furnace process are given, and the paper concludes with notes on the use of the electric furnace in malleable-iron foundries and on the selection of the most suitable type of furnace for a given installation.

SCIENTIFIC DEVELOPMENT OF THE STEAM LOCOMOTIVE, by John E. Muhlfeld. Although marked progress has been made in the development of the steam locomotive and the results have been in many respects exceedingly effective, they have, nevertheless, been largely confined to assisting in improving sustained boiler capacity and increased thermal efficiency. There is, therefore, still considerable opportunity for further improvement, and this paper is a discussion of the various factors incidental to the design and construction of locomotives. Such matters as purification of boiler feedwater, use of various grades and types of fuel, heat losses, steam generation and superheating, steam distribution and utilization, and wasted heat are accordingly considered. The author also discusses acceleration and deceleration of a locomotive, and the power required for accessories such as air-brakes, signals, train lighting, heating, ventilating, etc.

AN INVESTIGATION OF STRAINS IN THE ROLLING OF METAL, by Alfred Musso. This paper is a discussion of one of the most important problems incidental to rolling-mill operation. In such mills, while raw stock is being transformed, a certain amount of material is wasted, and to determine the factors involved in this waste, the author asks and answers this question: "What is the most convenient length and width of the piece of metal to be rolled in order to produce a finished article of certain definite dimensions so that the waste of material may be reduced to a minimum?" The answer, which forms the body of the paper, is based on data secured as a result of actual investigation.

A NEW TYPE OF HYDRAULIC-TURBINE RUNNER, by Forrest Nagler. This paper is in the nature of a preliminary announcement describing the development of a new type of water-wheel runner, which it is ex-

pected will largely supplant the well-known mixed-flow reaction type. The first part of the paper is devoted to an explanation of the term "characteristic speed," which, while in the nature of a repetition of much more extensive articles previously written, is nevertheless thought to be desirable because of its peculiar adaptability to water-wheel analysis. A brief history of water-wheel development is next presented, which indicates that for nearly one hundred years characteristic speeds were gradually increased from 20 to 100, whereas the new form of runner reaches characteristic speeds averaging 150. The paper concludes with a short statement of the advantages and field of application of the new type of runner.

Appraisal and Valuation Methods, by David H. Ray. The author holds that appraisal and valuation are essentially engineering functions, and that it is the duty of the engineer to develop, guide and control the method and procedure employed. He pointed out that the variables affecting values depend on labor, material and an aleatory factor to cover the general risk of the business, with particular reference to marketing. Charts, curves and tabulations are given to show the change in these values during the period of the war, and terms used in appraisal work are defined. The author also directs attention to the desirability of giving a value to a machine as a unit, of the grouping of similar tools, and of the use of symbols in the form of numbers and letters in tagging the materials to be appraised.

Kerosene as a Fuel for High-Speed Engines, by Lawrence F. Seaton. Despite the fact that considerable work has been done toward the use of kerosene as a fuel for internal-combustion engines, there still remain many unsolved problems. To study these the author accordingly made a series of tests on a high-speed, heavy-duty-type of engine, using kerosene as a fuel, and these tests form the basis of his paper. The apparatus used and the manner of conducting the tests are described in detail, and as a result of his work the author states that in his opinion a kerosene engine would be successful if designed so that the piston displacement were higher than that commonly used, if the intake passages were larger and shorter, and if the incoming gases were heated to a temperature considerably above that of the boiling point of kerosene.

Oil Pipe Lines, by S. A. Sulentic. This paper compares the cost of pipe-line transportation of oil with that of rail and canal. It also points out the advantages of the oil engine as a means of economically transporting oil for a long distance through pipes, and derives formulæ by means of which one may calculate the pressure, net horsepower, and brake horsepower necessary to transmit any quantity of oil through a pipe of known diameter.

The Thermal Conductivity of Insulating and Other Materials, by T. S. Taylor. Although numerous experimenters have been interested in making thermal-conductivity measurements, but very few data are available for such materials as are used in the construction of electrical machinery. To further investigate this field, the author accordingly conducted a series of tests based upon two methods, both of which he explains in detail. The results obtained are tabulated for such materials as fish paper, fuller board, cambric, mica tape, various kinds of woods, asbestos, plate glass, sheet steel, wool felt, etc.

The Lubrication of Ball Bearings, by H. R. Trotter. Ball-bearing lubrication is a subject of which little is known, and this is chiefly due to the fact that there is no accepted method of determining the lubricating value of an oil or grease. As a step toward the development of a satisfactory method the author has devised an instrument for such a purpose, a brief description of which is given in his paper. The operating characteristics of a ball bearing as related to the problem of lubrication are also discussed and the specifications for a satisfactory oil are given. The use of grease and graphite as a lubricant is also briefly considered and the paper concludes with a suggested procedure for the analysis of lime-soap greases.

Thread Forms for Worms and Hobs, by B. F. Waterman. The use of worm gearing is steadily increasing and accompanying it, perhaps its cause, is a corresponding increase in efficiency and durability. This is doubtless the result of a better understanding of both the theoretical and mechanical problems involved, some of which the author points out in his paper. The author also suggests methods for bringing about a uniform and satisfactory practice in worm gearing.

Air Pumps for Condensing Equipment, by Frank R. Wheeler. This paper is devoted to a consideration of past and current practice in air-pump design and selection. After presenting a classification of air pumps the author proceeds to briefly describe the features of each type, stating their limitations and respective advantages and disadvantages. Special attention is given to the steam-jet ejector type of pump, whose advantages are stated to be: extreme simplicity, reliability and flexibility, stability, minimum space and weight, low steam consumption and high efficiency; and furthermore that it requires no maintenance or attention. The author concludes his paper by taking up the matter of selecting an air pump of proper size and capacity for a given condenser installation, accompanying his discussion with illustrative calculations and charts.

Octaval Notation and the Measurement of Binary Inch Fractions, by Alfred Watkins. This paper is an argument for the adoption of a system for measuring the binary inch fractions. At present there are two systems; one which divides the unit into halves, quarters and eighths, etc., and the other which makes use of a decimal notation. The author proposes to replace these by an octaval notation in which eight is to be used as the radix. He accordingly first presents the method of constructing such a notation, this being followed by a description of various types of rules, calipers and micrometers based upon it. It is not to be inferred, however, that the author proposes the substitution of octavals for decimals in all branches of engineering work, but he does advocate their use to denote the British binary inch fractions in the workshop and on workshop measuring instruments.

Motor-Transport Vehicles for the United States Army, by John Younger. This paper contains a discussion of the types of vehicle best adapted to various military needs. Motor-transport vehicles have been classified by the United States Army under ten broad heads, ranging from the small 250-lb. motorcycle to the 5-ton truck. The classification has been found to be a most satisfactory one, and the ultimate ideal, of course, is to standardize the single type of vehicle for each class. With that point in view the author discusses the various vehicles used, giving in connection therewith numerous photographs as illustrative of American design and construction. Tables and characteristic torque curves are appended to the paper, and these afford a comparison of the specifications of both commercial and specially designed Government trucks and vehicles.

OCTAVAL NOTATION IN SHOP MEASUREMENTS

(*Continued from page 871*)

Simplifications in Measuring "Limits"

The fact that all the standard binary fractions are expressed in the first two places of octavals, and that all the limit allowances and tolerances come in the next (3d and 4th) octaval places gives a new and unexpected value to octaval notation. The workman sets his standard size on two scales of the calipers or micrometers, and the plus or minus allowance on two different scales. No pencil or mental calculation of adding or deducting is required. Another happy fact which makes the provision of limit tables for octavals very easy, is that the third place in octavals ($_{0}001$) is $\frac{1}{512}$, and half this ($_{0}0004$) is $\frac{1}{1024}$, which is so near the much-used "thou" of the mechanic (within 2½ per cent of it) that it can safely be substituted for it in all the limit tables.

In conclusion, it should be stated that this paper is not a proposal for the substitution of octavals for decimals in all branches of engineering. It advocates their use to denote the British binary inch fractions in the workshop and on workshop precision instruments. Any use beyond this, and there are many, is for future experience. A maker adopting these in workshop practice need not bring them into his catalog until their simple logical structure is better known.

A PERFECTED HIGH PRESSURE ROTARY COMPRESSOR

(*Continued from page 878*)

The compressor may be built either vertical or horizontal and in the small sizes up to 5 cu. ft. it is air-cooled. Between this and the 15-cu. ft. size it is partly water-cooled. In the 20-cu. ft. size and above it is completely jacketed.

The advantages of the rotary compressor, all of which have been demonstrated commercially, are as follows:

1. Small weight per unit of capacity, about $\frac{1}{15}$ of that for reciprocating machines
2. Small amount of floor space required, about $\frac{1}{20}$ of that for reciprocating machines
3. Small initial cost of installation
4. Most economical drive known employed, either electric motor or steam turbine direct-connected
5. Small amount of headroom required. The machine is usually about the same size as the motor required to drive it
6. Simplicity of construction and hence small cost for adjustment or repair
7. Self-lubricating, since the entire machine operates in a bath of oil.

A MASTERPIECE OF STEEL CARVING

At a meeting of the New York Section on October 9, 1919, preceding the address of the evening, Mr. George J. Foran exhibited what he considered to be the finest modern specimens of steel carving. Mr. Foran added interest to his exhibition by his brief historical analysis of the causes which brought the art of wrought-metal work to the highest state of perfection during the golden age of Nuremberg, namely, its vital importance to the ruling classes and the insistent demand and commensurate remuneration for armor of maximum combined efficiency and beauty.

This, with the added honors bestowed upon the most successful artisians, inspired successive generations of artistic craftsmen to devote their entire life, thought, and energy to the development and perfection of the essential arts of heat treatment, hardening processes, etching, fretting, enameling, damascening, embossing, and sculptural work. Many of these arts became practically lost when the demand for this highly specialized craft ceased with the passing of armor upon the gradual practical development of firearms during the fifteenth century.

At this time Nuremberg reaped a well-earned reward for its long-continued encouragement and protection of the arts and crafts by becoming, in addition to one of the great marts of the commercial world, the center from which all great religious, scholarly and artistic movements of Germany emanated — for the reason that most of the important German scholars, artists and craftsmen had gradually been drawn to Nuremberg. These men, led by such master craftsmen as Peter Vischer, Adam Kraft and Vist Stoss, under the inspiration and example of the scholar-mathematician and artist, Albrecht Dürer, the father of German painting, turned their talents to commercial lines with great success.

The "Forest Smithy," rather inadequately reproduced in the accompanying illustration, in its subject, period, conception, perspective and execution is a perfect specimen of the old Nuremberg school. It depicts the moment when a knight, riding through a forest, discovers some trouble with his armor, and having tied his charger at the edge of the wood, is engaged in testing and bending the blade of a sword which the old smith is showing him while his assistants inside are busy at work. The smithy is the characteristic one of the Middle Ages, built upon the rough hillside in the forest to be near the charcoal supply; piles of mud and stone will be seen upon the roof to keep it from blowing off. On the road up to the castle will be seen a journeyman smith asking a village maiden the way to the smithy, which she is pointing out. The amount of undercutting and perfection of detail work can only be realized upon close inspection.

The "Forest Smithy," Carved from 2-in. x 12-in. Stock, Mild Steel, 18⅝-in. Long, by Frank L. Koralewsky of Boston. Weight in the Rough 127 Lb., Finished 30 Lb.

This beautiful carving was produced by Mr. Frank L. Koralewsky, of Boston, who served his apprenticeship in Germany with a firm of old-established artsmiths who adhered strictly to the best traditions of their art. After his masterpiece had been accepted and he was created a journeyman, Mr. Koralewsky spent several years traveling and working in different sections of Germany to become familiar with every branch of his art and to study the exhibited work of the early masters. He came to the United States in 1896 and settled in Boston. His work received immediate recognition and his gates will be found at Harvard, Yale and Princeton Universities, his screens at the Cathedral of St. John the Divine in New York, and fine specimens of his work in locks, handles, hinges, irons, etc., in the large public and private estates throughout the country. He received the gold medal and grand prize at the Panama Exposition for his carved wrought-iron lock illustrating the old fairy tale of "Snow White and the Seven Dwarfs."

Mr. Foran also exhibited a watch carved by Mr. Koralewsky in most wonderful detail and several smaller pieces of his work. Mr. Koralewsky executes this carved work in his spare time purely from his love of the art and always with the hope that by its exhibition other workers may be similarly inspired and the standard of the craft thus raised.

These specimens were loaned by Mr. Koralewsky to Mr. Foran for the purpose of exhibition at the different works of the Worthington Pump and Machinery Corporation. The result was most satisfactory in the way of deeply interesting the various workmen and furnishing them an outside interest for their spare time in reading the histories of the development and successes of the great craftsmen and studying the possibilities of the material upon which they work ordinarily in a purely perfunctory way.

THE JAMES WATT CENTENARY

At the James Watt Centenary Commemoration exercises held in Birmingham, England, from September 16 to 18, there was present a notable gathering of engineers and scientists to pay tribute to this remarkable man. The Society was fortunate in being represented by three of its members, J. Wilfred Harris, H. F. L. Orcutt and J. Sanford Riley.

The program arranged by the committee was a most comprehensive one and it would be difficult to attempt to tell of the many events. Three, however, will long be remembered by those who took part in the exercises—the service at the parish church of Handsworth where James Watt was buried, the chapel of which contains the famous Chantrey sculpture of the great engineer; the visit to the garret workshop of Watt, and the inspection of one of his early engines which was put under steam for the occasion. This was the Ocker Hill engine which was built in 1776 and erected at Smethwick for pumping operations in connection with the Birmingham Canal.

The main purpose of the commemoration, however, was the raising of a fund for an international memorial. It is hoped that this will take the form of a James Watt Chair of Engineering at the University of Birmingham for the promotion of research into the fundamental principles underlying the production of power and the study of the conservation of the natural sources of energy. It is also hoped to erect a James Watt Memorial Building to serve as a museum for collecting together samples of the work of James Watt and his contemporaries, Boulton and Murdock, illustrating this interesting epoch in the history of engineering. The building would also serve as a meeting place and library for scientific and technical societies and be a center from which engineers could coöperate in spreading scientific knowledge.

In a little pamphlet issued for this occasion there appears a very interesting sketch of the career of James Watt written by Prof. F. W. Burstall of the University of Birmingham, an abstract of which follows:

The name of Watt is familiar on both sides of the Atlantic and as a hundred years have now elapsed since his death, it is possible to estimate at its true value the influence which his genius had upon the modern world.

The popular idea that Watt invented the steam engine is not correct as the Newcomen engine had been in regular use for more than a century before his discovery. Watt's work lay in the improving of an imperfect and wasteful machine, which could be employed only where fuel was cheap, into the powerful and economical steam engine with which we are all familiar. In the evolution of our modern life the steam engine has had perhaps a greater effect than any other single influence and in the development of the steam engine James Watt stands out as the great pioneer.

Watt started life as an instrument maker and was so employed by the University of Glasgow where he was led into the study of the steam engine in repairing a model of the Newcomen engine. In his experiments he learned how wasteful was the Newcomen in fuel consumption and thereupon started his study of heat properties in which he received valuable aid from the well-known Dr. Black. Watt was not long in seeing that the great defect in the Newcomen engine lay in the ejection of the condensing water into the cylinder, which led to his discovery of the separate condenser with which his name will be associated for all time.

As is usual with inventors, the years immediately following his discovery were years of trial and disappointment. Success came when the partnership was formed with Matthew Boulton, a well-known manufacturer of small metal goods in Birmingham and the founder of the famous Soho Works. He was a man of great enterprise and dauntless courage and his belief in Watt's genius never wavered throughout their connection of a quarter of a century. One other man had no small share in Watt's success and this was William Murdock who worked throughout his life at the Soho Works. His invention of gas lighting, his introduction of compressed air for power distribution and his experiments in mechanically propelled vehicles, carried out in Cornwall as early as 1785, all go to prove him a man of remarkable power.

Watt's first engines were principally used for pumping in Cornwall, where the deepening of the mines made an economical source of power essential. The first rotating engines were not produced until nearly ten years after Watt had settled in Birmingham. It was Watt's intention to use the common crank for the purpose of the conversion of reciprocating into rotary motion but in this he was forestalled by the idea's being stolen and patented, so he contented himself with the sun-and-planet motion for effecting the same purpose. The rotative engine at the Albion Flour Mills in London and another at Whitehead's Brewery, also in London, marked the beginning of the use of steam power for industrial purposes.

The use of the independent valves for the admission and exhaust of steam, the slide valve, the governor, the indicator, all took their rise in the fertile brain of James Watt, and when he left the steam engine in 1800 it possessed practically all the features with which we are today familiar.

From the year 1800 until his death in 1819 Watt withdrew entirely from business and spent his time in scientific and mechanical pursuits. In his house at Heathville Hall, near Birmingham, there is preserved intact Watt's workshop, with all his tools in good condition and practically untouched since the time when they fell from the hand of Watt himself.

In character Watt was a man of retiring and modest disposition, who made no endeavor to push himself in the public life. His last letters show his kindly disposition, in the advice which he was always ready to give to those younger than himself. All contemporary accounts of his later life speak of him with a respect almost amounting to veneration.

It would seem only fitting that a permanent memorial should be raised to the trio of pioneers who have done so much by their discoveries to advance the material happiness and prosperity of the human race. Such a memorial should be one likely to be of service to future generations, and it should make its home in the city where these three men spent their manhood, rested in their old age, where so many relics of their work are preserved and where lies all that is mortal of Watt, Boulton and Murdock.

A Plea for the Enfranchisement of Junior Members

To the Editor:

Under the provisions of the Constitution of the A.S.M.E., adopted 34 years ago, Junior members of our Society are not allowed to hold office or even to vote. The Government permits all men, and in some states all women, not only to vote, but to hold office immediately on coming of age. Our religious and social organizations are, if anything, even more liberal in this respect. Among scientific and technical societies I find the engineers are the only ones which make this age distinction. As soon as doctors or lawyers or architects are admitted to practice they are given the right to vote and hold office in their respective professional organizations. Will it be alleged that our Juniors, who in most cases have completed stiff courses in high-grade engineering schools, are less qualified to bear a responsible part in professional activities? As I pointed out in the February issue, "This class of members will always be in a hopeless minority." A Junior who joins our Society on coming of age and who later becomes eligible for full membership, spends eleven years without a vote!

Would we not be better off for having the young man's point of view? Do we not need the young man's capacity for dreaming dreams and seeing visions? When it was a matter of recruiting regiments for service in France, it was these 21-30-year olds we wanted. Have they not earned the right to full companionship in the Republic? Perhaps some one who thinks otherwise will tell us why.

Morris Llewellyn Cooke.

Philadelphia, Pa.

COMMON ERRORS IN MACHINING OF BEARINGS

(Continued from page 880)

tion which proved to be the sole cause for the very unsatisfactory performance which this wheel gave in service. Fig. 6 shows a magnification of part of the edge *b* of Fig. 3, the inner edge or surface of this wheel from which it is centered accurately to within a thousandth of an inch upon its spider. This surface had been tooled in a horizontal boring mill with a single cut, the tool set so as to produce a smooth finished surface. The cutting of this surface, however, was done with a tool that was sharp and had sufficient rake, showing that it is an easy matter to cut a bronze surface satisfactorily without distorting the natural orientation of its crystalline structure.

NEWS OF THE ENGINEERING SOCIETIES

Reports of Meetings of Engineering Society of Western Massachusetts, National Safety Congress, International Railway Association, and American Foundrymen's Association

Engineering Society of Western Massachusetts

The Engineering Society of Western Massachusetts met at Pittsfield on October 14, the afternoon being spent in inspecting the Pittsfield Works of the General Electric Company. After the trip through the works a dinner was held, at which there were present one hundred and twenty-three members. The principal speakers were C. C. Chesney, general manager of the Pittsfield Works; G. Faccioli, chief engineer of the Pittsfield Works; Charles H. Wright, Republican Candidate for District Attorney; Calvin W. Rice, Secretary of American Society of Mechanical Engineers; and S. W. Ashe. Mr. Faccioli spoke very interestingly regarding the problems connected with high-voltage installations. Mr. Ashe in his remarks dealt with Americanization problems at the Pittsfield Works.

National Safety Congress

The Eighth Annual Safety Congress, held in Cleveland, October 1 to 4, by the National Safety Council, was divided into sections representing the automotive, cement, chemical, structural, metal, mining, woodworking, rubber, packing, paper and pulp, and textile industries, and special sections relating to steam and electric railroads, women in industry, employees' representation, Americanization, health service, public safety, public utilities, and marine and navigation. The papers read at the sessions of the metals sections included: Accident Prevention in a Malleable Iron Foundry, by H. L. Church, Rockford, Ill.; Personal Element in a Safety Program for the Foundry, by H. F. Grantland, Marion, Ind.; New Ways to Put Safety Across in a Steel Plant, by H. P. Hoyne, Canton, O.; Humanizing a Steel Plant, by Philip Stremmel, Granite City, Ill.; and Practical Demonstration of Welding and Cutting, by J. Schleicher, Baltimore, Md. A complete collection of commercial and non-commercial safeguard appliances and devices was exhibited in connection with the congress. There were seventy booths, in which were shown types of safety equipment for every industry.

International Railway Association

The International Railway Congress Association, the foundations for which were laid at the congress convoked at Brussels in 1885 by the Belgian Government for the purpose of celebrating the fiftieth anniversary of its railways, has just been reconstituted under the title of International Railway Association. The Association published, up to 1914, a monthly bulletin containing, besides original articles upon all questions relating particularly to the technique, working and organization of railways, reproductions of the most interesting articles appearing in the railway reviews of the world, and detailed reviews of works dealing with railway affairs. At the closing sitting of the eighth session, held in Berne in 1910, it was decided that the ninth session should take place in Berlin in 1915, and the preparations for this session were far advanced in 1914 when Germany declared war and began the invasion of Belgium. Naturally the invasion of the country, and the measures taken by the occupying powers, resulted in the paralysis of activity on the part of the Association for nearly five years, but after the return of the Belgium Government, the Association was placed under sequestration, in pursuance of the Belgian law of November 10, 1918, owing to the fact that a portion of its assets belonged to the subjects of enemy nations. The sequestrator having ordered the dissolution and liquidation of the society, the railway administrations, members of the Association, belonging to thirty-five countries in and outside Europe, decided to transfer their property to an association established upon exactly the same bases as before, and entitled the International Railway Association.

American Society of Safety Engineers

At a special meeting held in the Engineering Societies Building, New York, on September 26, the American Society of Safety Engineers adopted a new constitution defining more specifically its scope in the technical engineering field and reorganizing its activities so as to include the adoption and application of safety-engineering standards, the maintenance of a library devoted to the particular requirements of safety engineering, and helpful coöperation with official and other safety organizations. The coöperation of the Society with the Bureau of Standards and The American Society of Mechanical Engineers was discussed, as well as the formulation of national safety codes on elevators, head and eye protection, and lumber and woodworking machinery.

Association of Iron and Steel Electrical Engineers

The thirteenth annual convention of the Iron and Steel Electrical Engineers was held in St. Louis, Mo., September 23 to 26. D. M. Petty, retiring president, outlined the progress made by the Association in the establishing of new sections at various cities and emphasized particularly the advantage of holding section meetings, which, he said, further the interest of the steel and iron industry by bringing together the men who are striving with the problems of increasing production, lowering costs and improving the quality of the plant product.

Of special importance were the reports of the safety and educational committees. Walter Greenwood, of the Carnegie Steel Company, Youngstown, Ohio, submitted the report of the safety committee, which comprised safety rules for the government of employees working on electrical equipment. In the report of the educational committee, presented by A. B. Holcomb, of the Standard Tin Plate Company, Canonsburg, Pa., the necessity of training electrical employees of foreign birth was strongly emphasized. Discussion of the reports of these committees brought out the suggestion that safety should be considered before tonnage in all cases, and that it is more practicable to teach men what to do than what not to do.

The report of the electric-furnace committee of the Association outlined the present status of electrical furnaces in the steel industry. The discussion brought out the insufficiency of the available technical literature on electric-furnace reactions. Concerning furnace-lining thicknesses, the opinion was expressed that too thin a lining wasted heat, while an abnormally thick lining limited the capacity of the furnace. The careful training of the operator was considered to be of paramount necessity for securing the successful operation of any electric furnace. On the question of the shape, it was stated that the furnace body should be of such shape as to give equal heat at every point.

Calvert Townley, President of the American Institute of Electrical Engineers, presented an interesting historical sketch of the growth and development of electrical power as applied to the iron and steel industry. He pointed out that coöperation between

the various electrical societies was necessary in deriving the greatest benefits.

Much attention was attracted by an exhibition in which thirty-four manufacturers displayed electrical equipment.

American Foundrymen's Association

Remarkable advances in the design, development, and manufacture of metal-working and foundry equipment and in the solution of problems involved in casting practice and plant operation, were evidenced in the technical sessions and exhibition of the twenty-fourth annual convention of the American Foundrymen's Association, which was held in Philadelphia from September 29 to October 3 concurrently with the annual meeting of the Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers. A significant feature of the convention was the attendance of more than a score of visitors from England, France, Norway, Japan, India, and Australia.

A paper on The Application of Powdered Coal to Malleable Annealing Furnaces, presented by Charles Longenecker, of the Bonnot Co., Pittsburgh, contained a description of the plant of the Pressed Steel Car Co., formerly the Pennsylvania Malleable Co., where powdered coal is being successfully employed for operating annealing furnaces. The figures quoted showed that the cost of operating one furnace ranges from $8400 a month with fuel oil to $2625 a month with powdered coal. That steel is being melted with 450 to 600 lb. of powdered coal per ton of charge and that 15 malleable foundries using powdered coal for annealing have a fuel ratio of from 500 to 700 lb. of coal per ton of castings was stated by A. J. Grindle, of the Combustion Economy Corporation, Chicago, who discussed the question of Powdered Coal for the Small Foundry.

Statements of costs covering the operation during four months of a 20-ton acid open-hearth furnace and a 6-ton basic electric furnace were compared and discussed by E. H. Ballard, of the General Electric Co., West Lynn, Mass. Mr. Ballard's figures showed that the cost of making electric steel is comparable with that of the open-hearth product. A. W. Merrick of the General Electric Co., Schenectady, N. Y., in the Refining of Cupola Malleable Iron in the Electric Furnace, presented the results of experiments on the duplex process of melting malleable cast iron, using a cupola and electric furnace. Special attention was paid to the effect of the electric furnace in reducing sulphur and to the influence of manganese. In one experiment the material contained 0.20 per cent sulphur before charging in the electric furnace; 15 minutes later a sample showed that the sulphur had been reduced to 0.057 per cent. Mr. Merrick offered several conclusions, among which was the statement that by the duplex process of melting malleable cast iron, using a cupola and electric furnace, it is possible to make iron of any carbon and silicon desired by adding the proper amounts of steel and ferrosilicon to the bath.

A special session was held to discuss the problem of industrial relations. The authors of four papers advocated systematic training for foundry apprentices, journeymen, and foremen along lines which will familiarize them with the economic conditions that play an important part in determining the administrative policies of the employers. The slogan "multiply yourself through your foreman," introduced by one of the speakers, impressed manufacturers as being a pertinent suggestion to remedy present conditions.

The exhibits of molding machines, sand-blasting equipment, and metal- and wood-working machinery furnished ample proof that engineers have taken full advantage of the cessation of hostilities to engage in experimental work and to further the development of labor-saving machines. Among the noteworthy machines displayed by the manufacturers of molding equipment was a device for producing tractor transmission housings entirely in green sand. Other new equipment included a combination split-pattern machine display, a jarring stripping-plate machine, an agricultural tractor, a 16-in. jolt roll-over machine fitted with a pattern and operated as a molding machine, and a combination jolt split-pattern molding machine equipped with an automatic slow-starting pattern-draft cylinder operated by oil and controlled by a knee valve.

American Institute of Mining and Metallurgical Engineers

The one hundred and twentieth meeting of the American Institute of Mining and Metallurgical Engineers was held at Chicago from September 22 to 26, inclusive. Exceedingly comprehensive and valuable papers were prepared for the twelve technical sessions, in which the subjects discussed were: Iron and Steel; Sulphur Coals; Pyrometry; Non-Ferrous Metallography; Non-Ferrous Metallurgy; Coal and Gas; Mine Taxation; Mining and Local Resources; Geology; Milling; Oil; and Industrial Organization. It will be of interest to call attention to some of the papers presented, especially at the iron and steel session.

A report of the work being done at the United States Bureau of Standards for the purpose of determining the gases in steel and the deoxidation of steel, was submitted by J. R. Cain, Chief of the Section of Chemical Metallurgy. The aim has been to examine critically some of the simpler methods in order to remedy any defects, to make them more rapid, and to form some idea of the metallurgical significance of the results obtained by them. The final object of the work, which is not altogether complete, is to devise a few simple methods which it is hoped will be useful to the steel manufacturer in controlling his deoxidation processes.

Erosion Tests of Rifle Barrels were described by Major A. E. Bellis, Ordnance Department. Three barrel blanks were prepared from the same bar of steel and treated differently. The first barrel was heat-treated by quenching from 1500 deg. fahr. and drawing for two hours at 1200 deg. fahr.; the second barrel was rolled at 1350 deg. fahr.; and the third barrel was rolled at 1200 deg. fahr. The three barrels were submitted to a 13,000-round firing test with measurements for accuracy and erosion. The accuracy was measured by firing ten rounds on each two targets at 500 yd. with muzzle rest; the tests were made after each 2000 rounds from 4000 to 10,000 and then every 1000 to 13,000; the firing was at the rate of 10 to 20 rounds per minute per rifle, cooling the rifles with water after each 100 rounds. The relative erosion was shown by the increase of diameter of the lands at the muzzle, which was 0.0018 in., 0.0020 in. and 0.0029 in. for the three barrels, respectively. After the tests the three barrels were sawn lengthwise and the appearances of the sections examined. It was concluded that the homogeneous structure of a heat-treated barrel offers the best resistance to erosion.

The results of an experimental study of the Effect of Time and Low Temperature on Physical Properties of Medium-Carbon Steel were presented by G. A. Reinhardt, metallurgist, and H. L. Cutler, assistant metallurgist, The Youngstown Sheet & Tube Co. In the first series of tests, four cores were drilled from each of six untreated blooms. Two cores from each bloom after being machined were rested for two days at room temperature, and then they were tested; the two duplicate cores after being machined were rested for two days on top of a Hoskins hairpin-type electric furnace where the temperature was kept at about 120 deg. cent. A second series of tests was also made in identically the same manner except that the test pieces were given a rest of four days before being tested. These two series of tests showed that a light increase in temperature resulted in a great increase of the possible elongation and reduction of area of the specimen, and also with the increased length of rest at the temperature of the top of the furnace. The increase in tensile strength was greater in the case of the two days' rest than in the case of the four days' rest.

Other interesting papers presented at the iron and steel session were: Blast Furnace Refractories, by Raymond M. Howe; Effervescing Steel, by Henry D. Hibbard; Aircraft Steels, by Albert Sauveur; Manufacture of Steel Rails, by Robert W. Hunt; Cooling Properties of Technical Quenching Liquids, by N. B. Pilling and T. D. Lynch; Differential Crystallization in Cast-Steel Runner, by Francis B. Foley; Manufacture and Properties of Light-Wall Structural Tubing, by H. J. French; Oxygen in Cast Iron and Its Applications, by Wilford L. Stork; Graphitization of White Cast Iron upon Annealing, by Paul D. Merica and L. J. Gurevich; Experimental Data Obtained on Charpy Impact Machine, by F. C. Langenberg.

ENGINEERING COUNCIL

Engineering Council[1] is an Organization of National Technical Societies of America, Created to Consider Matters of Common Concern to Engineers, as Well as Those of Public Welfare in Which the Profession is Interested

Engineering Council Joins Chamber of Commerce

WORD has been received by Engineering Council that the organization has been elected to membership in the Chamber of Commerce of the United States. In joining this great association of trade and commercial organizations, Engineering Council adds its strength to organized business and gives its members an opportunity to register their views with the central body in the consideration of national questions that affect business. Engineering Council represents five great national societies of professional engineers,— the American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, The American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the American Society for Testing Materials. These societies have an aggregate membership of 41,000.

Engineering Council has appointed as National Councilor to represent it in the National Chamber, Mr. Harold W. Buck, of Viele, Blackwell & Buck, Consulting Engineers, New York City, and past-president of the American Institute of Electrical Engineers, and as alternate Mr. Irving E. Moultrop, of the Edison Electric Illuminating Company, Boston, Mass., member of The American Society of Mechanical Engineers and American Institute of Electrical Engineers.

The Chamber of Commerce of the United States was formed in 1912 as a means of bringing together all of the industrial and business elements of the country. How well it has succeeded is shown in a recent statement that the membership of the Chamber now consists of more than 1100 organizations in every state of the Union, in the outlying possessions and of all the principal American chambers of commerce abroad.

One of the chief aims of the National Chamber is to obtain the best thought on national questions that concern business. This is done through a system of referenda on which the more than half a million individual members of the organizations comprising the Chamber are entitled to vote through their associations. The opinion of business, thus obtained, is transmitted to Congress and to public officials and is given to the public.

The National Chamber will be able to render assistance to Engineering Council in many ways. It will receive weekly a general bulletin containing the latest and most authentic news of what is transpiring at Washington. There is also a special legislative bulletin issued weekly while Congress is in session following the progress of all legislation concerning business. Special bulletins are issued also as occasion arises. Members of the National Chamber also have the privilege of using all the facilities of the Chamber's offices in Washington when information is desired. This applies to every division of business, since the Chamber's organization is made up so that each general division of business has in Washington a special bureau to care for its particular needs.

Engineering Council Holds Important Meeting

On October 16, in the rooms of The American Society of Civil Engineers in the Engineering Societies Building, New York, Engineering Council held an all-day session, at which many matters of interest and importance were considered. Chief among these were reports of the Committee on Classification and Compensation of Engineers, the National Service Committee and the Committee on Curricula of Engineering Schools. Space will not permit, however, of an extended discussion of these and other reports, and for the present the brief abstract of the minutes of the meeting presented below must suffice.

The report of the Committee on Curricula of Engineering Schools, however, deserves special mention. Dr. Alexander C. Humphreys, President of Stevens Institute of Technology, is chairman, and while the committee is not prepared as yet to recommend a six-year course for colleges of engineering, it nevertheless called attention in its report to the fact that both Columbia University and the Massachusetts Institute of Technology are now conducting six-year courses in engineering in addition to their regular four-year course. The problem is also being studied and experimented with by other universities. The committee, however, does endorse the proposition to extend and enlarge the facilities for vocational training throughout the United States, and particularly in the great industrial centers. The committee also goes on record as favoring universal military training.

Employment Bureau reported 17,000 interviews, 4800 men registered, more than 1000 placed and total expenditure $10,600, in past 10 months; 60 to 70 men call daily.

National Service Committee active in connection with National budget legislation, Congressional Commission on Reclassification of Salaries, mileage for former engineer officers, Interstate Commerce Commission and International Joint Commission vacancies, Industrial Conference, census classification of engineers, U. S. Topographical Mapping and Department of Public Works. Washington office used increasingly by engineers and Government.

Chamber of Commerce has admitted Council to membership. H. W. Buck appointed National Councilor and Delegate, and I. E. Moultrop alternate.

National Department of Public Works: petition to Chamber of Commerce was voted by Engineering Council asking referendum on bill for Department of Public Works.

License Committee, at five-day session in Chicago, October 13 to 17, revised draft of typical law for registration of engineers.

Classification and Compensation of Engineers: progress in collecting and digesting data on Federal, Railroad, State and Municipal engineers. Final report on Federal service this month. Increases granted railroad engineers below $2500.

Fuel Conservation Committee recommended support of legislation for investigating super-power generation and distribution in Boston-Washington district; so voted.

Joint Conference Report of Development Committees was discussed and letters sent to Founder Societies endorsing general plan for a national engineering council.

Financial Statement: total resources, $50,393; expended, 9 months, $32,651, including $10,601 for Employment Bureau and $17,038 for Washington office.

Tentative Budget 1920: $60,000 needed for all purposes. Appropriations of Founder Societies must be supplemented by contributions from individuals.

Appeal for Funds to be made at once to engineers throughout the country.

Water Conservation Committee reported twenty-seven correspondents appointed in as many States, and much useful information collected.

Curricula of Engineering Schools: Committee reported on six-year course.

Reconstruction Commission, New York: Advisory Committee's recommendations sent to governors of all States and many civic bodies in New York.

Patents Committee: three bills, based on report of committees of National Research Council and Engineering Council, now before Congress.

Jurisdiction Awards in Building Industry: Board held first meeting in Washington August 11. Report by Council's representative, R. P. Miller.

Types of Government Contracts: important committee appointed.

Payment for Estimating: three delegates appointed to meet Associated General Contractors and American Institute of Architects, in Chicago.

National Budget: four delegates sent on invitation of committee of House of Representatives discussed budget legislation.

[1] Officers of Engineering Council: J. Parke Channing, *Chairman*, Alfred D. Flinn, *Secretary*; Engineering Societies Building, 29 West 39th Street, New York.

NATIONAL SERVICE COMMITTEE

Contributed by the Washington Office[1]

Engineering Legislation in Congress

Although Congress is chiefly engaged with problems relating to the Peace Treaty and the industrial unrest throughout the country, there have, nevertheless, been presented to it numerous bills and measures dealing particularly with engineering subjects. These bills deal with such matters as war minerals relief, soldiers' land settlement, tariff, water power, etc. Most of them are now being considered by the various committees of Congress and brief abstracts of them are herewith presented.

United States Reclamation Work

An appropriation of $250,000,000 for the purpose of carrying on and completing irrigation projects, which have been begun or estimated for and for the investigation and completion of such new projects as may be deemed feasible and desirable to undertake, is proposed in recent bills. According to the Director of United States Reclamation Service, it will cost $112,134,000 to complete projects that have been started. A total of 1,552,555 acres will be susceptible of irrigation, and the total ultimate irrigable area will be 2,948,161 acres.

Another important bill relating to irrigation work has had the special attention of the House. It proposes to allow water supply for reclamation projects to be used for miscellaneous purposes. Under the existing law, much inconvenience and trouble has been caused, owing to the fact that water for reclamation projects could not be used for domestic purposes, for railway engines and the miscellaneous needs of communities. This bill is expected to shortly receive consideration in the House.

War Minerals Relief

Legislation proposing to liberalize the War Minerals Relief Act is now before the Committee on Mines and Mining of the House. This Committee is considering House Joint Resolution No. 170, which brings out the fact that war minerals claims in excess of $15,000,000 had been filed but that a considerable portion of the claims are being denied because of the Attorney-General's interpretation of the Act. The resolution states that it was the intention of Congress in passing the War Minerals Relief Act "that all producers of the minerals mentioned should be repaid such sums as they are in equity and good faith entitled." The Attorney-General's opinion is that the request or demand must have been made on the claimant direct. The resolution provides that all claimants "who in response to any personal, written or published request or demand from any of the Government agencies mentioned in said Act in good faith expended money in producing or preparing to produce any of the ores or minerals named therein . . . and have heretofore filed their claims within the time and in the manner prescribed in said Act" are to be reimbursed for the net losses incurred. Another important feature of the resolution is that in the event that the appropriation is not sufficient to liquidate all claims allowed that a pro rata share of the appropriation is to be awarded to the claimants. Fifty per cent of the amount of any adjudicated claim is to be paid immediately.

Soldier Settlement Bill

The Mondell Soldier Settlement Bill, which is now before the House, is again coming actively to the front and determined efforts are being made to have it passed. Great differences of opinion have developed and the entire discussion on the soldier settlement plan seems now to be around the Mondell bill. Those who favor the bill point out the fact that it is the continuation of the historic policy of opening the way for the veterans of war to settle on the land. In the absence of public lands suitable for farming the acquisition of land in private ownership is necessary. It is argued that the bill comprises good business policy because tracts of poor land will be cleared, graded and irrigated. This is to be done by the soldiers, thus affording an opportunity to accumulate the amount of money required for the first payment on such property as may be alloted to them. Limited sums of money to be loaned for construction of permanent improvements to give a fair margin of security and at the rate of 4 per cent interest is held to be a reasonable income to the Government. Colonization of soldier settlers is necessary to proper Government supervision and to the securing of maximum economy and efficiency. Some action of this kind of legislation is apparently forced because of different schemes which have been suggested to either compensate veterans of the world war or to give them other opportunities.

Tariff Bill

When the House passed the magnesite tariff bill, it added one more to the jam of tariff bills awaiting action of the Senate Committee on Finance. As passed the bill provides a duty of one-half a cent per pound on magnesite ore; three-quarters of a cent on calcined dead-burned and grain magnesite, and three-quarters of a cent per pound and 10 per cent ad valorem. These rates represent a considerable reduction from the tariff proposed by the House Ways and Means Committee of three-quarters of a cent on ore, one and one-half cents on calcined dead-burned and grain magnesite and a duty of 25 per cent ad valorem on magnesite brick. The duties imposed are claimed to be high enough to prohibit imports of magnesite, and the increased rate would add only three and three-quarters cents per ton to the price of finished steel.

The question of a strong protective tariff on graphite is now before the House. The original writing of this bill provides a duty of two cents per pound on all imported amphorous graphites; a duty of three cents per pound on crystalline, lump and chipped graphite; and a duty of six cents on all large sizes of crystalline graphite. The first provision affects graphite produced in Mexico and Korea; the second provision affects the importation of the better grade of Ceylon graphite, while the last provision affects Madagascar and Canadian flake. The bill if enacted will practically exclude the importation of Canadian graphite and Madagascar flake.

The delay in considering the tariff bills before the Senate committee is due to the fact that it opposes "piece-meal" tariff legislation as it is conducted by the House, and they do not regard the matter of general revision of tariff with enthusiasm until such time as world conditions are in a more stable state. Many are of the opinion that the enactment of a general anti-dumping bill would protect American interests until it is possible to form a better idea of international trade relationships.

The United States Tariff Commission in reporting to the Committee on Ways and Means pointed out the fact that it would be unfair to group all scientific instruments together and place a blanket duty on them. And this, they say, is just an example of the plan to adapt a general tariff. Investigations further show that, in many cases, superior articles are now produced in the states to those formerly imported.

Machine Tools for Technical Institutions

Recently, the House passed a bill authorizing the Secretary of War to sell to schools, universities and colleges surplus machine tools which could be used for educational purposes. The educational institutions were to be charged 10 per cent of the original cost of these tools.

The Senate Committee on Military Affairs has now reported another bill authorizing the Secretary of War to transfer permanently to the Federal Board for Vocational Education, about $250,000 worth of this equipment. Surplus machine tools are to be loaned to the board, which, in turn, distribute them to schools and colleges throughout the country. This bill proposes to place

[1] Washington Office in charge of M. O. Leighton, *Chairman*, National Service Committee, McLachlen Building, 10th and G Streets.

the title to these machines in the hands of the Vocational Board, which is to report to Congress annually as to the disposition and use of the tools.

Water Power Bills

Engineering Council through its Water Conservation Committee is making determined efforts to assist in passing a bill (H.R. 3184) which will give the country good water-power legislation. The interest shown by requests for exact information on this bill indicates that the active interest and support required will be given by engineers. It is hoped that opposition to the bill, led by Wisconsin senators, will be broken through the influence of Wisconsin engineers.

The bill as reported to the Senate contains several important changes in the text of the bill passed by the House but these are not fundamental changes, and it is contemplated that the House will concur. The Senate Committee has explained and clarified the definitions of "reservations," "navigable waters" and "costs." A proportionate license fee not exceeding twenty-five cents per horsepower is proposed, which is to defray costs of the administration of the act. Fair rentals are to be charged for Government dams and other Government property on water-power sites. The House bill gave the Commission unlimited power to fix annual charges, whereas the Senate amendment limits this blanket power as indicated above. A change was made to provide that in case the United States does not exercise the right to take over the works, the license tendered shall be "on reasonable terms" and "which is accepted" by the original or the new licensee. That provision was thought necessary to make it certain that capital would invest under the law. A provision for severance damages was stricken out by the sub-committee and was restored by the full committee, so that it now appears in the bill.

Delay faces the action on this bill because past efforts to have immediate consideration indicate that it must await the disposal of the Peace Treaty before it comes up for consideration on the Senate floor. In reporting the bill to the Senate calendar, Senator Jones of Washington, chairman of the Committee on Commerce, pointed out its advantages as: "a saving of coal and a lower price for that used; a saving of oil, and a lower price for that consumed; more efficient transportation, and lower cost of service; the development of new industries; the building up of new communities; the creation of new property values, subject to taxation for the support and maintenance of local and state governments; and added employment for labor and increased markets for agricultural products," and urged that "we should pass legislation which will lead private capital and enterprise to develop these resources under such regulations as will give consumers good service and cheap power or the Government itself should proceed to make this development." This bill proceeds on the theory of private development with ultimate public ownership possible. While some of the fundamental provisions of this measure do not meet the approval of the members of the committee, we deem it wise to accept them in view of the legislative situation, rather than incur the result of no legislation on this important subject.

Budget Legislation

Through the National Service Committee of Engineering Council arrangements were made for the Public Affairs Committee and other representatives of Engineering Council to appear before the Select Committee on the Budget on October 1. Mr. Charles Whiting Baker, chairman of Council's Public Affairs Committee, gave reasons for the general desire among engineers for the adoption of a budget system, and pointed out the importance of such a system in Government work of an engineering nature. Mr. N. P. Lewis, Chief Engineer, Board of Estimate and Apportionment, New York City, explained the budget system as used in New York, showing that under existing conditions it would practically be impossible for New York to get along under any other system. Director and Chief Engineer of United States Reclamation Service, Mr. A. P. Davis, pointed out the necessity of the proper segregation of Government bureaus before an effective budget system can be adopted, and as a correct example of segregation, cited the plan proposed in the Jones-Reavis bill, whereby all related bureaus having engineering activities would be placed in the same department. Such a plan would simplify and make possible the efficient use of the budget system and of lump sums appropriation where responsible department heads could be obtained. Mr. W. R. Warner of the Warner-Swasey Company, Cleveland, pointed out the great advantages that had accrued to private engineering operations through the use of the budget system. It was pointed out during the hearing that engineering work was particularly hampered by the present system of appropriation. The lump sum or "continuing contract" method was held to be necessary in many cases. Illustrations of the success of the plan are the Panama Canal, levee work being done on the Mississippi River and the large reclamation projects.

There are obviously three phases of budget legislation: (1) formation of budget, (2) action on budget by Congress, and (3) supervision and control of the execution of budget. A new bill has been introduced and reported to the House calendar which aims to cover the first and third phases, while the second phase is to be cared for by House legislation which proposes a much larger appropriation committee to care for the budget in Congress. The main bill provides executive responsibility for the budget with Congressional authority to raise or lower it. The President, assisted by the Bureau of the Budget, is to prepare the estimates, which are submitted to him by the several executive departments, and no other officer is to submit estimates to Congress unless by special request. Provisions are made for an alternate budget in which estimates are to be made in the same form as they appear in current appropriation laws. The bill provides an independent establishment known as Accounting Department, because it is deemed necessary that Congress should have a check on expenditures under the direction of comptroller general and assistants, which would not be effective if the comptroller was appointed by the President. In reporting this bill, the chairman of the Select Committee on the Budget has explained that the bill is not intended to be the last word in budgetary legislation but is intended to correct weaknesses and to be a step in the right direction which will very probably have to be extended and further improved .

Engineers in the 1920 United States Census

As a result of Engineering Council's request to the Director of the Census, the National Service Committee has been successful in effecting a reclassification of engineers so that all technical engineers will be listed as such, separately and distinctly from the non-technical engineers. Thus, the next census will bring on enumeration of all technical engineers together as one unit under the main headings of Civil, Mechanical, Electrical, and Mining. Architects will also be enumerated separately.

This will enable the engineering profession, the Government or any other interested organization or person to know exactly how many technical men there are in the United States and in each State. Under separate headings the enumeration will also include non-technical engineers (stationary engineers, locomotive drivers and other engine-men); but there will be no group heading for the latter, and in order to get the totals of non-technical engineers (enginemen) all of the various grades of this classification would have to be sorted out and added.

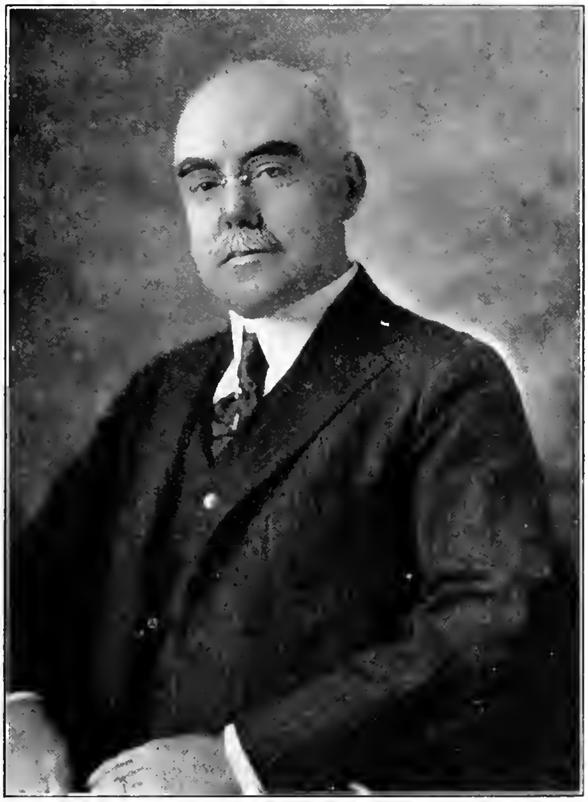
There are of course many practitioners of engineering who do nor ordinarily classify themselves under any one of the four headings given above and others there are whose practice extends into more than one field. More numerous headings or more complex classification is impracticable in the work of the Census Bureau. It is believed that every professional engineer can, with very little violence to the facts, place himself in one of the broad classes adopted for the 1920 census: Civil, Mechanical, Electrical, Mining. With the general coöperation of all engineers along these lines a much better enumeration should result than in any preceding census.

NECROLOGY

CHARLES EDWARD LORD

Charles Edward Lord, general patent attorney and manager of the patent department of the International Harvester Company, Chicago, died suddenly on September 25, as the result of injuries received in an accident at the Deering Works the evening before.

Mr. Lord was born in Somerville, Mass., on October 31, 1875, attended the public and high schools at Somerville, and was graduated from the Massachusetts Institute of Technology with the degree of B.S. in 1898. For a year he was employed in the inspection department of the American Telephone and Telegraph Company, with headquarters at Philadelphia. He then returned to the Massachusetts Institute of Technology as instructor for a short time, and later became assistant examiner in the United States Patent Office, Washington, D. C.



Charles E. Lord

In 1902 he entered the employ of the General Electric Company as assistant attorney in the patent department, which position he resigned in 1904 to take charge of the patent departments of the Bullock Electric Manufacturing Company and the Allis-Chalmers Company, spending four years at Cincinnati and four years at Milwaukee in this work. During part of this period he was president of the Bullock Electric Company.

He studied law at the Georgetown University Law School, Washington, D. C., was admitted to the bar in Ohio, Wisconsin and Illinois and to practice in the federal courts and in the Supreme Court of the United States.

Mr. Lord was associate editor of the Encyclopedia of Engineering and wrote several textbooks for this publication when it was getting under way. He was a lecturer on patent law at Marquette University, and during the days of the War was a member of the War Committee of the Technical Societies of Chicago. For two years and until recently he was chairman of the committee on patents of the National Implement and Vehicle Association.

During 1918 he served as chairman of the Chicago Section of our Society and at the time of his death was a member of the Committee on Aims and Organization, in the work of which he took a keen and active interest. He was also interested in the pioneer movement inaugurated by the Western Society of Engineers, in Chicago, for a strong and all-embracing local engineering society in that city.

His ability as an inventor, though not widely known, is evidenced by a record of nearly forty United States patents.

Mr. Lord was a fellow of the American Institute of Electrical Engineers, a member of the Society of Automotive Engineers, the Engineers' Club of Chicago, the American Patent Law Association, the University Club of Washington, D. C., and several other technical and social organizations. He became a member of our Society in 1909. [F.F.F.]

The following resolution was adopted by the executive committee of the Chicago Section:

> Whereas: Our fellow-member and former chairman of the Chicago Section, A.S.M.E., Mr. Charles E. Lord, who has served devotedly and who has sacrificed much in the interests of the mechanical engineers of the country, the Society and Section, has unfortunately been taken from us in the midst of a useful and active career; be it
>
> *Resolved*, By the Executive Committee of the Chicago Section that we record our deep regret at the loss of our friend and fellow-engineer. That we wish to express our appreciation of his high qualities, his interest in his profession, and the untiring zeal with which he has labored for its advancement and of its members, his great ability and high attainments. Be it further
>
> *Resolved*, That we express to his family and his associates in business our appreciation of his worth and our sincere sympathy with them in their loss.
>
> Executive Committee, Chicago Section,
> Arthur L. Rice, *Chairman*,
> G. R. Brandon, *Secretary*.

A similar resolution was passed by the Committee on Aims and Organization upon the receipt of the news of Mr. Lord's death.

JAMES WEBSTER CULLEN

James W. Cullen, First Lieutenant, Signal Corps, United States Army, died suddenly on June 28, 1919, shortly after his return from service overseas. Lieutenant Cullen was born on March 15, 1888, in Edgewater, a suburb of Chicago. He was educated in the schools both of that city and Hamilton, Ohio, later attending the Miami and Ohio State Universities. He was formerly connected with the Niles Tool Works, the Cullen & Vaughan Construction Co. and the Midvale Steel Company, having charge of the Pittsburgh sales office of the latter concern. He resigned from the sales department of the Elwell-Parker Company to enter the service, serving both in France and Italy.

Lieutenant Cullen was a member of the Chamber of Commerce of Pittsburgh and of several clubs and fraternal organizations. He became an associate-member of the Society in 1916.

FRANK J. LOGAN

Frank J. Logan, who, until his retirement in 1914, was vice-president and treasurer of the Logan Iron Works, Brooklyn, died on April 10, 1919. Mr. Logan was born on September 25, 1855, in Brooklyn, N. Y. He was educated in the public schools of the city and later attended the Flushing Institute and Cooper Union. He started work with his father in the Logan Iron Works. At the time of his father's death, in 1879, Mr. Logan entered the firm and continued with them until his retirement, May 1, 1914.

Mr. Logan belonged to a number of social clubs and business organizations. He became a member of the Society in 1894.

LOUIS MOHR

Louis Mohr, president and consulting engineer of John Mohr & Sons, Chicago, died on August 24, 1919. Mr. Mohr was born on September 27, 1858, in Chicago and was educated in the schools of that city prior to his entering the University of Illinois, where he completed in three years a four-year course in mechanical engineering. He was connected for short periods thereafter with the North Chicago Rolling Mills and the Old Excelsior Iron Works. In 1882 he associated himself with his father and brothers in the firm of John Mohr & Sons as consulting engineer. About ten years later he assumed the duties of secretary of the firm and from 1917 to the time of his death held the office of president.

Mr. Mohr was a member of the American Society of Naval Engineers, the American Institute of Mining Engineers, the Society of Western Engineers and a large number of other societies and clubs. He became a member of our Society in 1886.

LLOYD CECIL REYNOLDS

Lloyd C. Reynolds was born in Atglen, Pa., on November 20, 1893. He received his early education in the local schools and later entered Drexel Institute, taking the mechanical-engineering course, from which he was graduated in 1913. He was associated from 1913 to 1916 with the Overland Motor Company, Philadelphia, the Chambersburg Engineering Company, Chambersburg, Pa., and the Remington Arms Company, Eddystone, Pa. From July 1916, to the time of his death, January 6, 1919, Mr. Reynolds was employed as assistant engineer in the steam-engineering department of the Midvale Steel & Ordnance Co., Coatesville, Pa.

Mr. Reynolds was a member of the Drexel Club of Engineers. He became a junior member of the Society in 1917.

JAMES R. FLETCHER

James R. Fletcher, factory manager of the P. & F. Corbin Co., manufacturers of hardware, New Britain, Conn., died at his home in that city on September 13, 1919. Mr. Fletcher was born on February 21, 1867, in Jersey City, N. J., where he was educated and learned the trade of machinist. He served his apprenticeship with the New Haven Clock Company in tool making and die sinking. He was formerly associated with the American Cash Register Company, the National Cash Register Company, Sargent & Co., the New Britain Hardware Company, of which he was in charge for seven years, and the Yale & Towne Manufacturing Co., of which he was assistant superintendent.

J. R. FLETCHER

In 1906 Mr. Fletcher became associated with the P. & F. Corbin Co. as manufacturing expert to assist the general superintendent. Later he was made factory manager, a position created to give him the wider range warranted by his exceptional ability.

He was a member of a number of fraternal organizations. He became a member of the Society in 1906.

HUGH M. WILSON

Hugh M. Wilson, who, until his resignation in January 1917 was for six years first vice-president of the McGraw Publishing Company, died suddenly on September 19, at his home in Stockbridge, Mass. Mr. Wilson was born in June 1866, in Jacksonville, Ill. He was a graduate of the Illinois College. His first journalistic work was as a reporter for the daily press of the Middle-West. He was subsequently connected in varying capacities, including secretary, business manager, editor and president with the *Mississippi Valley Lumberman*, the *Northwestern Railroader*, the *Railway Age*, and the *Electric Railway Review*. After a year with the Barney & Smith Car Co., Dayton, Ohio, as vice-president in charge of sales, Mr. Wilson joined the McGraw Publishing Company.

Mr. Wilson became an associate of the Society in 1913.

RICHARD HAMMOND

Richard Hammond, former president of the Lake Erie Boiler Works and the Lake Erie Engineering Works, died on October 9, 1919. Mr. Hammond was born on January 27, 1849, in Thurles, Tipperary County, Ireland, and received his early education there in the parochial schools, coming to this country at the age of thirteen. He served his apprenticeship in the boiler-making trade in Troy, N. Y. In 1872 he moved to Titusville, Pa., and several years later bought out his partner's interests in an oil-well boiler and manufacturing business.

In 1880 he went to Buffalo and established the Lake Erie Boiler Works which soon obtained an unusual reputation for the manufacture of heavy marine boilers. In 1890 he organized the Lake Erie Engineering Works, the shops of which were equipped with the most modern tools especially designed and constructed according to Mr. Hammond's own specifications by the Niles Tool Works. He continued at the head of both concerns until 1917 when he retired from active business life.

Mr. Hammond was a member of the Engineer's Club of New York. He became a member of the Society in 1890 and devoted a great deal of his time and practical boiler-manufacturing experience to the Boiler Code Committee of the Society of which he was a member.

CYRUS T. RAYNER

Cyrus T. Rayner was born in New York City on January 28, 1879. He was educated in Southern schools and was graduated from Tulane University in 1902 with the degree of M. E. He spent one year in graduate work when he became connected with the Mississippi River Commission as junior engineer in charge of local surveys. From 1911 to 1912 he was associated with C. T. Rayner & Sons, consulting engineers. In 1912 he became first assistant engineer on the New Orleans Levee Board and four years later was made chief engineer, which position he was holding at the time of his death, January 19, 1919.

Mr. Rayner became a member of the Society in 1916.

OIL PIPE LINES

(*Continued from page 883*)

$$\text{Net hp.} = 17 \times \text{thousands of bbl. per day} \times P/1000$$
$$\text{B.hp.} = 20 \times \text{thousands of bbl. per day} \times P/1000$$

Since the horsepower varies directly as PQ and P varies directly as Q^2, it follows that hp. varies directly as Q^3.

Another relation of value in making rapid pipe-line calculations is the ratio between the diameter D and length L with the discharge Q and the pressure P remaining constant. From the friction formula [2], it will be seen that P varies directly as v^2L/D. Assuming P constant, L varies directly as D/v^2. For the same discharge, Formula [3], that is with Q constant, v varies directly as $1/D^2$. Therefore v^2 would vary directly as $1/D^4$. Substituting this value for v^2 above, it is seen that L varies directly as $D/(1/D^4)$, or in other words, L varies directly as D^5. This means that for the same discharge and pressure, i. e., the same friction, the length of the line would vary directly as the fifth power of the diameter.

Taking 6 in. as unity the fifth powers of several different diameters are as follows:

D =	6	8	10	12
D^5 =	1.0	4.2	12.8	32

An example will show how easily these relations are utilized. Let a proposed pipe line be made up as follows:

2 —	6-in. lines,	8 miles long	(Y-branch)
1 —	6-in. line,	6 miles long	
1 —	8-in. line,	10 miles long	
1 —	12-in. line,	12 miles long	

With the particular oil to be transported the pressure per mile when pumping 10,000 bbl. a day through a 6-in. line will be assumed as 20 lb. per mile. What, now, will be the pressure for 17,000 bbl. per day through above line and what will be the net hp. and b.hp. required?

Since P varies as Q^2, the pressure for 17,000 bbl. will be $\left[\frac{17{,}000}{10{,}000}\right]^2$ or 2.89 times the pressure for 10,000 bbl. The pressure in the line would then be 2.89×20 or 57.8 lb. per mile.

Inasmuch as the velocity is halved when using two 6-in. lines for the 8-mile section, each line carrying an equal amount of oil, the equivalent length of 6-in. line for each branch would be only two miles, the length varying directly as the square of the velocity. The length of 6-in. line equivalent to the 8-in. pipe would be 10 miles divided by the ratio of the fifth powers of the diameters 6 in. and 8 in. or $10/4.2 = 2.38$ miles. In a like manner the length of 6-in. line equivalent to the 12 miles of 12-in. pipe would be $12/32$ or 0.37 miles. In other words, the equivalent length of 6-in. pipe in the line under consideration would total 12.75 miles. Under a pressure on the line of 57.8 lb. per mile, the total pressure on the line would be 12.75×57.8 or 737 lb.

Making use of the simple formula for hp. already derived we have

$$\text{Net Horsepower} = 17 \times \frac{17{,}000}{1000} \times \frac{737}{1000} = 213$$

$$\text{Brake Horsepower} = 20 \times \frac{17{,}000}{1000} \times \frac{737}{1000} = 250$$

No doubt many other useful relations could be derived for the purpose of expediting pipe-line calculations, but those which have been presented are among the most useful.

THE ENGINEERING INDEX

(Reg. U. S. Pat. Off.)

Published Monthly by The American Society of Mechanical Engineers

The Engineering Index was Founded in 1884 by the Association of Engineering Societies; Published from 1895 to 1919 by The Engineering Magazine Company; and Acquired January 1919 by The American Society of Mechanical Engineers

THE following pages form a descriptive Index to articles on engineering and related subjects in current periodicals. In its preparation the Society's engineering staff regularly examines all of the technical journals and society publications received by the Engineering Societies Library, which form one of the greatest and most complete collections of scientific periodicals in the world, comprising upward of 1100 distinct publications in some ten languages. Cross-references are freely introduced in the Index, and in all cases where the titles of articles are not sufficiently descriptive, explanatory sentences are appended. The main abbreviations used in the items are given at the bottom of this page.

Mechanical Engineering

AIR MACHINERY

Air-Operated Tools

The Use of Compressed Air in Modern Industry, A. W. Swan. Can. Machy., vol. 22, no. 10, Sept. 4, 1919, pp. 253-255, 8 figs. Study on use of air-operated tools in mining, contracting, foundry, shipbuilding and machine shop.

Centrifugal Compressors

Centrifugal Compressors (Das allgemeine Verhalten der Kreiselverdichter), Gustav Fluegel. Zeitschrift des Vereins Deutscher Ingenieure, vol. 63, no. 20, May 17, 1919, pp. 455-460, 5 figs. Basic characteristics of centrifugal compressors both with casing that has no cooling device and with cooled casing. Also translated in Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 795-799 and p. 858, 5 figs.

Pickling Machine

Compressed Air Operated Pickling Machine. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 442-443, 3 figs. Installation of Mesta pickling machine at Consolidated Expanded Metal Co. utilizes compressed air to avoid installing high-pressure boilers.

Wind Motor

A Six-Foot Experimental Wind Motor, C. Blazdell. Model Engr. & Elecn., vol. 41, no. 955, Aug. 14, 1919, pp. 145-151, 7 figs. Constructed by writer with intention of utilizing power to drive small dynamos. (To be continued.)

CORROSION

Pipe Corrosion

Tests on Deoxidation of Hot Water During the Past Year, F. N. Speller. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 2, April 1919, pp. 141-144. Irene Kaufmann Settlement pipe-corrosion tests conducted at Pittsburgh Testing Laboratory.

Selective Corrosion

Selective Corrosion (Die selektiven Korrosionen), F. v. Wurstemberger. Schweizerische Bauzeitung, vol. 74, no. 8, Aug. 23, 1919, pp. 91-94. Causes of development and means for its prevention.

FOUNDRIES

Alloy Castings

Making Alloy Castings at Cramp's. Foundry, vol. 47, no. 331, Sept. 15, 1919, pp. 641-646, 10 figs. With reference to tests made of metals used and finished products in brass, bronze and alloy foundry.

Bronze Foundry

Bronze Founding (La fonderie de bronze), Alex. Legrand. Fonderie Moderne, vol. 12, no. 3, March 1919, pp. 62-65, 1 fig. Description of a crucible furnace. Suggested remedies against separation of elements in copper-tin alloys.

Castings

Casting to be Based on the Principles of Physics (In Japanese), Kotaro Honda. Jl. Soc. Mech. Engrs., Tokyo, Japan, vol. 22, no. 58, July 1919.

Centrifugal Casting

Notes on Permanent Moulds and Centrifugal Castings, J. E. Hurst. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 558-562 and discussion pp. 562-563, 4 figs. Treats principally of overcoming cracking and distortion of cast-iron dies. Paper presented before Conference of British Foundrymen's Assn.

Condenser Castings

Making and Casting Cylindrical Condensers — II, III, Ben Shaw. Mech. World, vol. 66, no. 1702 and 1704, Aug. 15 and 29, 1919, pp. 78 and 103-104, 5 figs. Aug. 15: Preparing boards so that they can be swept in sections. Aug. 29: Preparation of loam pattern for head.

Core Box

Core Box Construction — I, Joseph Horner. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 568-572, 18 figs. Illustrating various types of construction.

Crucibles

The Manufacture and Handling of Crucibles, Jonathan Bartley. Metal Indus., vol. 17, no. 9, Sept. 1919, pp. 414-416, 3 figs. Causes of their failure in metal-melting practice.

Duplexing Process

New Duplexing Process is Invented, H. E. Diller. Foundry, vol. 47, no. 331, Sept. 15, 1919, pp. 662-665, 9 figs. High-carbon steel is melted in electric furnace and transferred to converter to be finished. Good grade of metal said to be obtained at low cost in this way.

Dust

How to Reduce Dust in Foundries (Die Mittel zur Verminderung des Staubes in Giessereien). Metall-Technik, vol. 45, nos. 19/20, May 17, 1919, pp. 73-74. Describes types suited for various conditons.

Electric Steel Foundry

Experiences in Electric Steel Foundry. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 630-634, 3 figs. Data on steel-furnace performance, together with results obtained with electric core baking.

Electrically-Melted Steel Castings, John A. Holden. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 584-585. Illustrating with photomicrographs coarse structure of badly annealed slowly-cooled casting, and of same steel completely annealed and cooled in current of air.

Foundry Management

Hoosier Foundry Seeks Difficulties, D. M. Avey. Foundry, vol. 47, no. 328, Aug 1, 1919, pp. 505-509, 9 figs. Iron Trade Rev., vol. 65, no. 11, Sept. 11, 1919, pp. 701-705, 9 figs. How Electric Steel Co. of Indiana conducts study of processes for which casting is intended and the properties desired in part to be made before production is attempted.

A Study of Improved Methods in an Iron Foundry, C. S. Myers. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 578-580. Movement study, training and instance in which organization material, combined with specially devised system of payment are said to have effected considerable increase of output with reduced hours of work.

Improved Methods in a Foundry. Metal Industry, vol. 15, no. 9, Aug. 29, 1919, pp. 161-162. Quoting instance in which movement study, training and organization of material, combined with specially devised system of payment, it is said, effected considerable increase of output with reduced hours of work.

Production Cost and Profit Control in Non-Ferrous Foundries, Walter Glenn Scott. Metal Indus., vol. 17, no. 9, Sept. 1919, pp. 417-420, 1 fig. Method for keeping in touch with cost of a product at any stage of its manufacture.

Making Foundry More Attractive, F. H. Bell. Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 98-100, 7 figs. Emphasizes that better and more wholesome shop and working conditions would do much to make foundry a more attractive place in which to work.

Metal Molds

Using Metal Denseners and Molds, E. H. Broughall. Foundry, vol. 47, No. 328, Aug. 1, 1919, pp. 514-518, 7 figs. Sponginess in connecting sections between thin and thick casting parts, it is stated, may be remedied by metal denseners properly used. Permanent metal molds are recommended. From paper presented before Birmingham branch of British Foundrymen's Assn. and Staffordshire Iron & Steel Inst.

Model Foundry

Government Builds Model Foundry. Foundry, vol. 47, no. 331, Sept. 15, 1919, pp. 651-653, 7 figs. For making gray-iron and steel castings for the Navy. Plant represents investment of $1,500,000 in building alone.

Molding Machines

Pointers on Molding Car Couplers. Foundry, vol. 47, no. 328, Aug. 1, 1919, pp. 499-504, 11 figs. How molding machines are rigged. System for handling molds.

Special Rig for Continuous Foundry. Foundry, vol. 47, no. 331, Sept. 15, 1919, pp. 654-658, 8 figs. Four machines make molds with green-sand cores for tractor transmission housings; floor space saved by pouring as soon as molds are finished and shaking out while hot.

Molding Sand

A Comparison of British and American Moulding-Sand Practice, P. G. H. Boswell. Foundry

Trade Jl., vol. 21, no. 212, Aug 1919, pp. 552-556 and discussion pp. 556-557. Including table giving advantages and disadvantages of artificial and natural bonds in molding sands. Paper presented at Conference of British Foundrymen's Assn.

Pattern Plates

Pattern Plates for the Production of Light Castings, H. Sherburn. Foundry Trade Jl., vol. 21, no. 212, Aug. 1919, pp. 564-566 and discussion 566-567. Advises that range of uses of boxes to be operated be kept down to lowest possible figure. Paper read before Conference of British Foundrymen's Assn

Patterns

Cylinder Patterns—I, Jos. A. Shelly. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 67-70, 9 figs. Methods of laying out and constructing patterns and core boxes for pump cylinders.

Making the Pattern for a Four-Bladed Propeller, J. A. McEwan. Can. Foundryman, vol. 10, no. 9, Sept. 1919, pp. 250-251, 9 figs. Illustrating manner of proceeding.

Pouring Device

Labor is Saved by Pouring Device. Foundry, vol. 47, no. 328, Aug. 1, 1919, pp 519-520, 3 figs. Iron Trade Rev., vol. 65, no. 10, Sept. 4, 1919, pp. 637-638, 2 figs. Device consists of cylindrical ladle mounted on trunnions in such a way that iron may be discharged through nozzles which become submerged when ladle is rotated.

Shrinkage

Shrinking of Castings (Du retrait des pièces à la fonte), J. Duponchelle. Fonderie Moderne, vol. 12, no. 3, March 1919, pp. 50-54, 6 figs. Table is presented giving shrinking in length, in surface and in volume of various metals and alloys used in foundries.

Thin Metal Sections

How Water Shut-Off Boxes are Made. Foundry, vol. 47, no. 328, Aug. 1, 1919, pp. 494-498, 6 figs. Rigging required by reason of thin metal sections.

Turbine, Water Wheel

Moulding and Casting a Turbine Water Wheel, F. H. Bell. Can. Foundryman, vol. 10, no. 9, Sept. 1919, pp. 242-243. Noting order in which different parts are placed when ramming up mold.

FUELS AND FIRING

Alcohol

Alcohol as Fuel. South African Eng., vol. 30, no. 7, July 1919, pp. 119-120. South Africa as a possible exporter.

Blue-Water Gas

Blue Water Gas as a Metallurgical Fuel, A. E. Blake. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 443-444. Approximate cost of twin blue water-gas sets with daily capacity of 25,000,000 cu. ft. Cost of blue water-gas *vs.* producer gas per million B.t.u.

Fuel Conservation

Fuel Economy in Manufacturing Works—1, Charles F. Wade. Eng. & Indus. Management, vol. 2, no. 8, Aug. 21, 1919, pp. 235-236, 1 fig. General outline of causes which contribute to inefficiency.

Fuel Oil, Coal Competition

The Competition of Fuel Oil with Coal. Coal Trade Jl., vol. 50, no. 37, Sept 10, 1919, pp. 1109-1111. Analyses of threatened competition of fuel oil with coal.

Furnace Refuse

Loss Due to Carbon in Furnace Refuse, C. H. Perry. Power, vol. 50, no 13, Sept 23, 1919, pp. 700-702, 2 figs. Alignment chart for computing loss in question

Gaseous Fuel

The Utilization of Gaseous Fuel in Commercial Practice, F. W. Ewworth. Gas World, vol. 71, no. 1827, July 26, 1919, pp. 65-67, 7 figs. Including calculated diagrams giving percentage of total heat contained in final product at various temperatures. Paper presented to Soc. of British Gas Industries.

Gasoline-Kerosene Mixtures

The Flash and Burning Points of Gasoline-Kerosene Mixtures, James T. Robson and James B. Withrow. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 244-252, 7 figs. Effect of gasoline content on flash and burning points of kerosene; Foster closed cup and Cleveland type open-cup methods compared; flash and burning points of kerosene mixed with "low-test" gasoline, "high test" gasoline and "petroleum ether."

Illinois Coal

Bureau Tests Illinois Coal, R. S. McBride and I. V. Brumbaugh. Gas Rec., vol. 16, no. 4, Aug. 27, 1919, pp. 17-20, 3 figs. Bureau of Standards experimental tests of Orient coal to investigate influence of temperature on quality of coke produced.

Kerosene

See Gasoline-Kerosene Mixtures.

Kilns

Abnormal Draft Conditions in Porcelain Kilns as the Cause of Various Defects in Burning (Anormale Zugverhaltnisse bei Porzellanbrennöfen als Ursache verschiedener Brennfehler), Otto Wilhelm. Sprechsaal, vol. 18, no. 16, Apr. 17, 1919, pp. 115-117. According to writer, the chemical constitution of gases is of minor importance, but special care must be taken that combustion in firebox is complete, so that products of incomplete combustion, such as hydrocarbons, etc., do not reach the kiln and there precipitate on wares of lower temperature.

Oil Fuel for Ships

Oil Fuel for Ships. Times Eng. Sup., no. 538, Aug. 1919, p. 249. Comparison with coal.

Pulverized Coal

The Use of Pulverized Coal, William H. Odell. Steam, vol. 23, no. 3, Sept. 1919, pp. 63-65, 8 figs. Raymond system of pulverizing coal and air separation. (To be continued.)

The Use of Pulverized Coal—III. Engineer, vol. 128, no. 3316, July 18, 1919, pp. 50-53, 15 figs. Illustrating its aplications to metallurgy.

Pulverized Coal in Boiler and Furnace. Iron Age, vol. 104, no. 11, Sept. 11, 1919, pp. 709-710. Comparison with producer gas as fuel for open-hearth furnaces.

FURNACES

Heat-Treating Furnaces

Heating Furnaces and Annealing Furnaces—IX, W. Trinks. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 423-427, 7 figs. Charts for computing boiler horsepower available from waste heat of furnace.

Heat-Treatment Furnaces at the Sheffield-Simplex Motor Works, Limited. Iron & Coal Trades Rev., vol. 99, no. 2688, Sept. 5, 1919, p. 299, 3 figs. Producers are fired with gas coke. Consumption is said to be 5 cwt. per 24 hr. for a pair of the small or one of larger furnaces.

Kiln, Multiple-Stack

Multiple Stack Kiln Solves Burning Problems, N. Hermes. Brick & Clay Rec., vol. 55, no. 3, July 29, 1919, pp. 214-215, 5 figs. Type recommended for burning of high-grade ware.

Oil Furnace

Economy in Industrial Fuel Oil Furnaces, Max Sklovsky. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 495-500, 13 figs. Results of experiments undertaken to determine best method of obtaining high furnace efficiencies.

GAGES

Certification of Gages

Certification of Gages at Bureau of Standards, H. L. van Keuren. Mech. Eng., vol. 41, no. 10, Oct 1919, pp. 801-802, 2 figs. Outline of more important pieces of apparatus used for gage inspection.

Gage Limits

Gage Limits in Interchangeable Manufacture, E. C. Peck. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 803-805, and 858. Writer discusses merits of English and metric systems and suggests that a 10-in. meter would be a most desirable unit; he also gives explanation of terms allowance and tolerance and outlines method for using gages in strict interchangeable quantity production.

GAS ENGINEERING

Gas as Fuel

Gas as a Substitute for Petrol and Petroleum Products. Jl. Roy. Soc. Arts, vol. 67, no. 3484, Aug. 29, 1919, pp. 639-641. Report of Inter-Departmental Committee appointed by British Government to study possibilities of employment of gas in substitution for gasoline and petroleum products as source of power, especially in motor vehicles.

Gasometers

Study of Large Gasometers (Etude des grands gazomètres), L. Schaffner. Memoires et compte rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, no. 4, 5 and 6, April-June 1919, pp. 238-277, 24 figs. Design, formulæ and calculations.

Ovens

Kalamazoo Gas Oven Plant, Walter V. Turner. Gas. Rec., vol. 16, no. 4, Aug. 27, 1919, pp. 11-14, 7 figs. Mechanical equipment in installation of 15 horizontal slot ovens.

Power Plants, Gas-Works

Gas-Works Power Plants, H. C. Widlake. Gas Jl., vol. 147, no. 2934, Aug. 5, 1919, pp. 286-287. Concerning advisability of carrying out alterations which involve scrapping of an existing power motor in favor of an electric motor.

Purification

The "Backward Rotation" System of Purification. Gas Jl., vol. 147, no. 2935, Aug. 12, 1919, pp. 339-342, 1 fig. Ammonia losses in direct process of sulphate making.

Safety Lamps

Height of Gas in Safety Lamp, C. M. Young. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1207-1211, 2 figs. Experiments to correlate change of temperature of source of ignition with change of height of cap produced.

Stafford Gas Works

The Stafford Gas Works equipped for new Demands. Gas Jl., vol. 147, no. 2936 and 2937, Aug. 19 and 26, 1919, pp. 387-389 and 443-445, 10 figs. Large scheme effecting change in plant and processes. Among new features are vertical retort-house, MacLaurin centrifugal washers, neutral-process ammonia plant, gas holder and tank holding 1,000,000 cu. ft.

Standards

Cheaper Gas by Revising Present Standards. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 859-860. Use of lignite fuels and relaxation from present high calorific value recommended as means for decreasing cost of production.

HANDLING OF MATERIALS

Ash-Handling Equipment

Mechanical Sand- and Ash-Handling Plant of the Austrian State Railroad at Wörgl (Die mechanische Besandungs-und Ascheabfuhranlage im Heizhause Wörgl der d.-ö. Staatsbahnen). Zeitschr. des oesterr. Ingenieur-u. Architekten-Vereines, vol. 71, no. 17, Apr. 25, 1919, pp. 159-161, 9 figs. Locomotive shed is also equipped with electrically operated coal-loading device.

Chute, Spiral

Speed Up Production by Systematic Handling, J. H Moore. Can. Machy., vol. 22, no. 10, Sept. 4, 1919, pp. 250-252, 5 figs. Illustrating operation of spiral chute between floors.

Coal Handling

Transport and Handling of Coal—II, John H Anderson. Tran. Inst. Marine Engrs., vol. 31, no. 244, July 1919, pp. 131-218 and discussion pp. 218-229, 89 figs. Methods employed in Great Britain for handling of coal in bulk.

Handling Machinery

Machinery to Help Solve the Problem of High Wages, Labor Shortage and Shorter Hours Demand, Zenas W. Carter. Manufacturers Rec., vol. 76, no. 11, Sept. 11, 1919, pp. 103-106, 6 figs. Illustrating material-handling machinery.

Jeffery Equipment

Transferring Your Product Efficiency, J. H. Moore. Can. Machy., vol. 22, no. 11, Sept. 11, 1919, pp. 277-278, 5 figs. Illustrating uses of Jeffrey equipment.

Shop Transportation

Shop Transportation, J. H Moore. Can. Machy., vol. 22, no 5, July 31, 1919, pp. 122-131, 21 figs. Handling of materials as one of chief factors in efficient shop operation.

Small Shop

The Handling of Material in the Small Shop. Can Machy., vol. 22, no. 5, July 31, 1919, pp 110-111, 2 figs. It is asid that solution to handling problem is often very simple matter if thought out seriously.

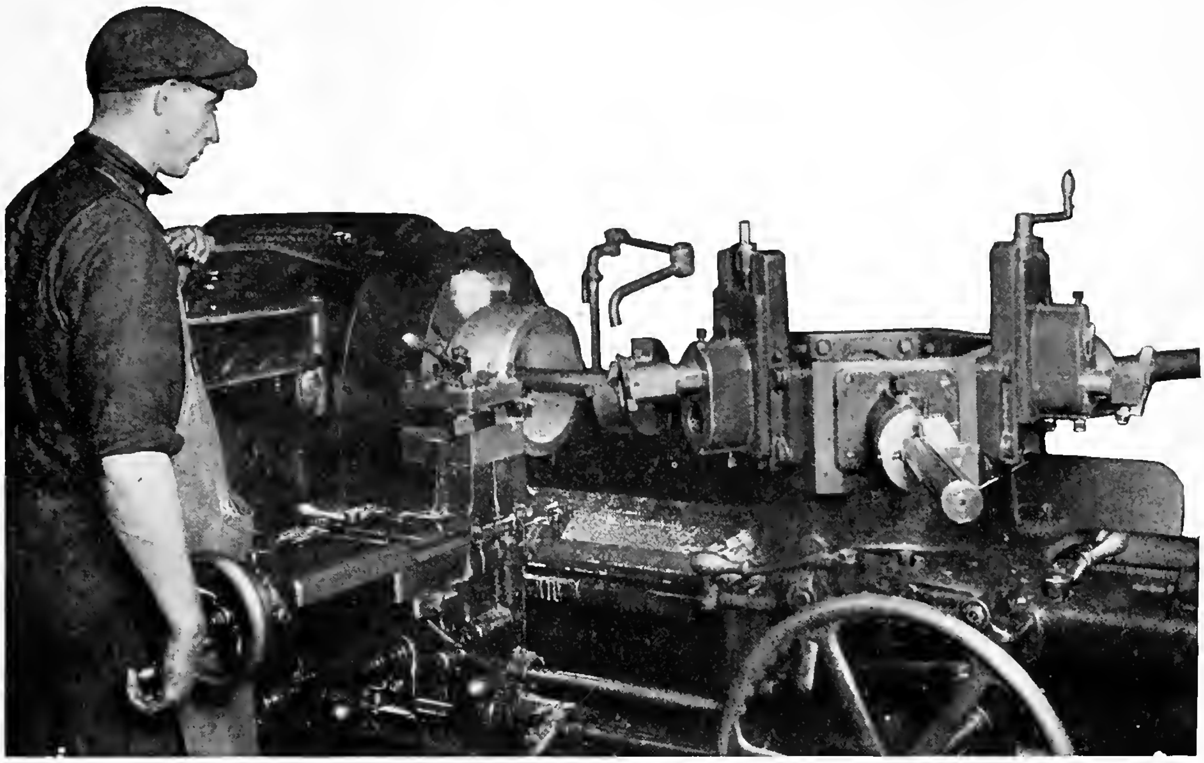
HEAT-TREATING

Case-Hardening

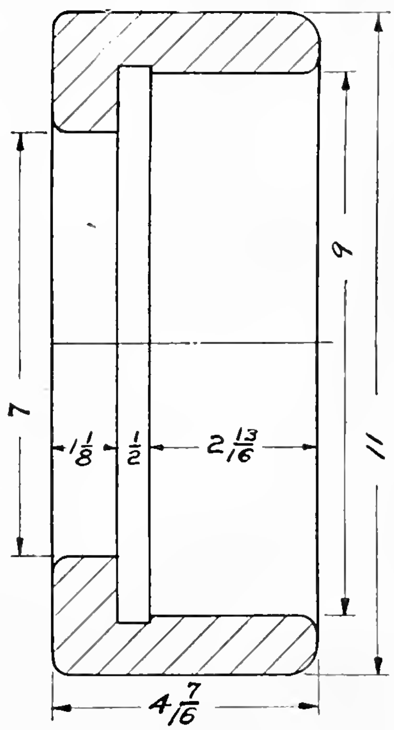
Practical Talks on Casehardening, Theodore G. Selleck. Jl. Am. Steel Treaters Soc., vol. 1, no. 10, Sept. 1919, pp. 325-335, 7 figs. Including suggested rules for heat treatment.

High-Speed Steel

American Practice for Hardening High Speed Steel. Proc. Steel Treating Research Soc., vol. 2, no. 6, 1919, pp. 34-36 and (discussion) pp. 36-42 and 45. Methods of treating alloys which



Breaks Another Time Record



The Hahn Manufacturing Company, a jobbing machine shop in Cleveland, reduced production time one-half on this drop forged Clutch Ring when the work was transferred from an engine lathe to a

No. 3-A Universal Hollow Hexagon Turret Lathe

Because of the flexibility of the tool equipment of the No. 3-A, the jobbing shop finds it adaptable for finishing small lots of different pieces as well as long runs of the same piece. Then the time saved by operating both square and hexagon turrets simultaneously, and the wide range of feeds and speeds for all classes of work makes the Universal Hollow Hex the machine for the jobber.

No. 4 Universal, 1½" x 10",	**16" Swing**
No. 2-A Universal, 2½" or 3¼" x 29",	**16½" Swing**
No. 3-A Universal, 3½" or 4½" x 44",	**21½" Swing**

THE WARNER & SWASEY COMPANY

CLEVELAND, OHIO, U. S. A.

TURRET LATHES—TURRET SCREW MACHINES—BRASS WORKING MACHINE TOOLS

NEW YORK Office—Singer Bldg. **Boston Office**—Oliver Bldg. **Buffalo Office**—Iroquois Bldg
Detroit Office—Ford Bldg. **Chicago Office and Show Room**—618-622 Washington Blvd.

FOREIGN AGENTS: Chas. Churchill & Co., Ltd., London, Birmingham, Manchester, Newcastle-on-Tyne and Glasgow. Allied Machinery Company, Paris, Turin, Barcelona, Zurich and Brussels. Stokvis & Zonen, Rotterdam. Wilhelm Sonesson Company, Malmo, Copenhagen, Gotenburg and Stockholm. Yamatake & Co., Tokio. Benson Brothers, Sydney and Melbourne. A. Asher Smith, Sydney. A. R. Williams Machinery Co., Ltd., Toronto, St. John, Winnipeg and Vancouver. Williams & Wilson, Ltd., Montreal

conform to generally accepted views relative to composition giving maximum cutting efficiency.

High-Speed Steel—Its Metallography and Heat-Treatment, G. J. Horvitz. Jl. Am. Steel Treaters Soc., vol. 1, no. 10, Sept. 1919, pp. 342-348, 13 figs. Illustrating with photomicrographs microstructure of metal at various stages in heat treatment process.

Rail Material

Heat Treatment as Applied to Railway Materials, C. R. Bronson. Jl. Am. Steel Treaters Soc. vol. 1, no. 10, Sept. 1919 pp. 336-341. Sound steel seen as fundamental basis for successful heat treatment. Process for heat treatment of rail steel by air cooling method described.

HEATING AND VENTILATION

Battleship

Report of Committee to Co-Operate with U. S. Navy Dept.—I. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 301-322, 4 figs. Investigations in regard to heating, ventilating and humidifying battleships and submarines.

Heating Installation

Heating and Ventilating Systems at the U. S. Government's Smokeless Powder Plant at Nitro, W. Va., G. W. Hubbard. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 287-293. Steam for manufacturing processes and for heating buildings throughout manufacturing department taken directly from high-pressure mains run above ground in wooden bents.

Plumbing Regulations

Recent Amendments to the New York City Plumbing Regulations Discussed, Albert L. Webster. Am. Architect, vol. 116, no. 2281, Sept. 10, 1919, pp. 361-365, 4 figs. Amendments permit restricted use of approved anti-siphon traps. Writer discusses relative merits of vented-bend trap and anti-siphon trap.

Radiation, Computations

Standard Rules for Computing Required Radiation. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 323-328. Report of Rules and Regulations Committee of Nat. District Heating Assn.

Schoolrooms

Heating and Ventilating the Standard School House, J. D. Cassell. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 261-266. Features of various systems. Writer advocates use of synthetic air chart for determining percentage of perfect ventilation, as originated by Dr. E. Vernon Hill, Chief of Ventilation Division of Chicago Dept. of Health.

Sprinkler System for Hot-Water Heating

Utilization of Automatic Sprinkler System for Hot-Water Heating, A. W. Moulder. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 273-280, 9 figs. Sketch showing typical combination installation.

Ventilation

A Comparative Study of Natural and Mechanical Ventilation for School Rooms, F. Gardner Legg and W. F. Walker. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 243-252, 8 figs. Investigations of Sanitary Bur. of Detroit Dept. of Health. Object was to determine what qualities must be present in class rooms so that physical well-being, comfort and mental alacrity of pupils may be at as high a standard as possible.

Classroom Ventilation, Konrad Meier. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 253-260. Discussion of data presented in Bul. no. 68 Reprint series, Dept. of Health of City of New York.

HOISTING AND CONVEYING

Belt Conveyors

Belt Loading and Carrying System, at Cement Mill Quarry, W. A. Scott. Belting, vol. 15, no. 5, Sept. 5, 1919, pp. 15-17, 5 figs. Inclined conveyors with combined capacity of 240 tons of material per hour.

Possibilities of Steel Belt Conveyor. Iron & Coal Trades Rev., vol. 99, no. 2687, Aug. 29, 1919, pp. 261, 3 figs. As competitor with rubber and fabric belts.

Bin Elevators

Special Features in Some Eastern Sand and Gravel Plants. Rock Products, vol. 22, no. 18, Aug. 30, 1919, pp. 18-20, 5 figs. Bin elevators avoid use of elevated bins; pan conveyor takes place of standard belt; skip hoists.

Conveyors, Gravity

The Economical Employment of Gravity Conveyors, J. Edward Schipper. Automotive Industries, vol. 41, no. 10, Sept. 4, 1919, pp. 467-472, 7 figs. Economy of system claimed because it is said not to involve further expense or worry after being installed.

Cranes

A New 250-ton Hammerhead Crane. Shipbuilder, vol. 21, no. 108, Aug. 1919, pp. 64-67, 2 figs. Constructed in connection with building of the "Vaterland." It differs from existing cranes in that jib carrying load is adjustable vertically through a certain angle to permit lowering loads on to deck of vessel. From Zeitschrift des Vereines Deutscher Ingenieure.

French Firm Constructs Reinforced Concrete Crane. Contract Rec., vol. 33, no. 35, Aug. 27, 1919, pp. 818-819, 1 fig. Crane has capacity of 6600 lb. and span of 32.8 ft. Rolling gear is removable and so attached that it can be adjusted to take care of any warping of crane. Translated from Génie Civil.

Semi-Portable Dock Cranes at Boston Army Base Wharf. Eng. News-Rec., vol. 83, No. 11, Sept. 11, 1919, pp. 516-517, 2 figs. Four hoists with 4-ton maximum capacity travel on tracks outside of wharf shed and load vessels in dock.

Electric Hoisting Machinery

Development of Electric Hoisting Machinery (Die Entwicklung des elektrischen Fördermaschinen-Antriebs), Schweizerische Bauzeitung vol. 74, no. 8, Aug. 23, 1919, pp. 95-97, 8 figs. Diagrams of machines with various types of drums.

Handling Coal and Ashes with Electric Hoists, James Monroe, Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 801-804, 9 figs. Illustrating types of systems and apparatus used in medium-sized plants.

Hoisting Rigs

Removing and Replacing Ceiling Motor Armatures, T. H. Fenner. Power House, vol. 12, no. 12, Aug. 5, 1919, pp. 347-348, 3 figs. Heavy rigging designed to handle heavy armatures with minimum of labor and time.

Skip Hoists

Induction Motor Drive for Skip Hoists, F. R. Burt. Elec. Jl., vol. 16, no. 9, Sept. 1919, pp. 381-382, 4 figs. Scheme showing relative positions of equipment and manner in which material is handled; also graphic records of load and speed with buckets empty and when hoisting full bucket.

Winding Drum

Bi-Conical Winding Drum at a Belgian Colliery, A. Bertiaux. Colliery Guardian, vol. 118, no. 3060, Aug. 22, 1919, p. 490, 3 figs. Driven by double-cylinder horizontal engine with cranks set at 90 deg. Translated from Annales des Mines de Belgique.

HYDRAULIC MACHINERY

Discharge Coefficients of Sharp-Edged Orifices

Experimental Determination of Discharge Coefficients of Sharp-Edged Orifices for Water and Sodium Chloride Brine and Discussion of Their Relationship (Die experimentelle Bestimmung der Ausflusskoeffizienten von Poncelet-Oeffnungen für Wasser und Kochsalzsole und Erörterung des inneren Zusammenhanges der Koefficienten), Adolf Schneider. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 213, 1919, 66 pp., 48 figs. Description of apparatus, measurements and test results. Coefficients are given for different heights, temperatures and concentrations.

Gate Closure, Pressure Rise

Pressure Rise Caused by Gradual Gate Closure, Norman R. Gibson. Can. Engr., vol. 37, no. 11, Sept. 11, 1919, pp. 295-299, 7 figs. Derivation of formulæ which include friction. (Concluded.)

Generator, 32,000 Kva.

A 32,500-Kva. Waterwheel Generator, R. B. Williamson. Elec. World, vol. 74, no. 9, Aug. 30, 1919, pp. 456-458, 4 figs. One of three units under way for Niagara Falls. Generator and wheel casing are rigidly connected. Weight, 300 tons.

Governors for Water Turbines

Seewer Universal Governor for High-Head Pelton Turbines [Le régulateur universel système Seewer pour turbines hydrauliques à haute chute (Pelton)], A. Strickler. Bulletin Technique de la Suisse Romande, vol. 45, no. 17, Aug. 23, 1919, pp. 169-171, 3 figs. Regulation effected by changing form of jet by means of movable guiding elements within admission nozzle. (Continuation of serial.)

McClure Hydroelectric Plant

The McClure Hydro-Electric Plant. Eng. & Min. Jl., vol. 108, no. 11, Sept. 13, 1919, pp. 457-460, 4 figs. Water flows through 13,600 ft. of 7-ft. pipe under 420-ft. head.

INTERNAL-COMBUSTION ENGINES

Air Cooling

Air-Cooling for Automobiles. Autocar, vol. 43, no. 1244, Aug. 23, 1919, pp. 271-272, 6 figs. Some details of cylinder design in relation to causes and prevention of overheating troubles.

Akroyd Cycle Engines

Akroyd Engine Cycles, Herbert Akroyd Stuart. Gas Engine, vol. 21, no. 9, Sept. 1919, pp. 275-281, 16 figs. Concerning origin of pure air compression with automatic ignition in crude-oil engines. Writer offers arguments in substantiation of his contention that the term "semi-Diesel" is a misnomer.

Benzol

The Use of Benzol and Benzol Mixtures as Motor Fuel, I. C. Mackie. Can. Chemical Jl., vol. 3, no. 9, Sept. 1919, pp. 295-297. Results of analytical work undertaken to determine effect of various settings of carburetor needle valve and also effect of surrounding temperature both by gasoline and benzol products.

Carburetors

Mathematical Study of the Operation of Constant-Level Spray Carburetors (Étude Mathématique de fonctionnement des carburateurs à giclage et à niveau constant), Génie Civil, vol. 75, no. 7, Aug. 16, 1919, pp. 148-152, 5 figs. Conditions for their automatic operation. (Concluded.)

The Asmo Carburettor. Autocar, vol. 43, no. 1244, Aug. 23, 1919 pp. 280, 1 fig. Instrument creates automatically its own vacuum feed.

Diesel Engines

Official Report on First Shipping Board Diesel Engine. Motorship, vol. 4, no. 9, Sept. 1919, pp. 34-35, 1 fig. Thirty-day non-stop full-power test of McIntosh and Seymour 750-b.hp. marine engine.

Winton Diesel Oil Engine. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 453-455, 5 figs. Details of type built for stationary service for direct connection to generators, pumps, etc.

The Diesel Engine in the Southwest, B. V. E. Nordberg. Eng. & Min. Jl., vol. 108, no. 12, Sept. 20, 1919, pp. 497-500, 3 figs. Economy of power secured from this source compared with that from steam.

Diesel Engines in Mine Power-Plants, C. Legrand. Min. & Sci. Press, vol. 119, no. 11, Sept. 13, 1919, pp. 369-372, 2 figs. Reports that two vertical two-cycle engines, each with five cylinders and rated at 1250 b.hp. at sea-level have given satisfactory service at mines situated at elevation of 5950 ft. above sea level.

The White Diesel Heavy Oil Engine. Shipbuilding & Shipping Rec., vol. 14, no. 10, Sept. 4, 1919, pp. 263-265, 3 figs. Details of construction and results of tests.

Doxford Oil Engine

The Doxford Oil Engine. Engineer, vol. 128, no. 3316, July 18, 1919, pp. 64-65, 1 fig. How principle of engine has been transformed to make engine a hot-bulb engine instead of a Diesel.

Fuel Mixtures

The Possibilities of New Fuel Mixtures for Internal-Combustion Engines, E. Humboldt. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 418-420. Concerning production of cheap and cleaner substitute for gasoline by mixing with engine distillate a small amount of ether and alcohol.

See also Benzol.

Heavy-Oil Engines

Official Test Report De La Vergne Heavy-Oil Marine Engine. Motorship, vol. 4, no. 10, Oct. 1919, pp. 26-27, 6 figs. Consumption of lubricating oil, heat balance and temperature in crankcase in 14-day test. (Concluded.)

Hot-Plate Engines

See Kromhout Engine.

Kromhout Engine

A Dutch Marine Oil-Engine. Motorship, vol. 4, no. 10, Oct. 1919, pp. 40-41, 5 figs. Kromhout hot-plate ignition two-cycle-type engine.

Turbine, Sanders

The Sanders Pressure Turbine. Autocar, vol. 43, no. 1245, Aug. 30, 1919, pp. 317-320, 9 figs. Model of a new form of petrol engine without reciprocating parts, capable of running at 4,000 r.p.m. and receiving 40,000 power impulses per minute.

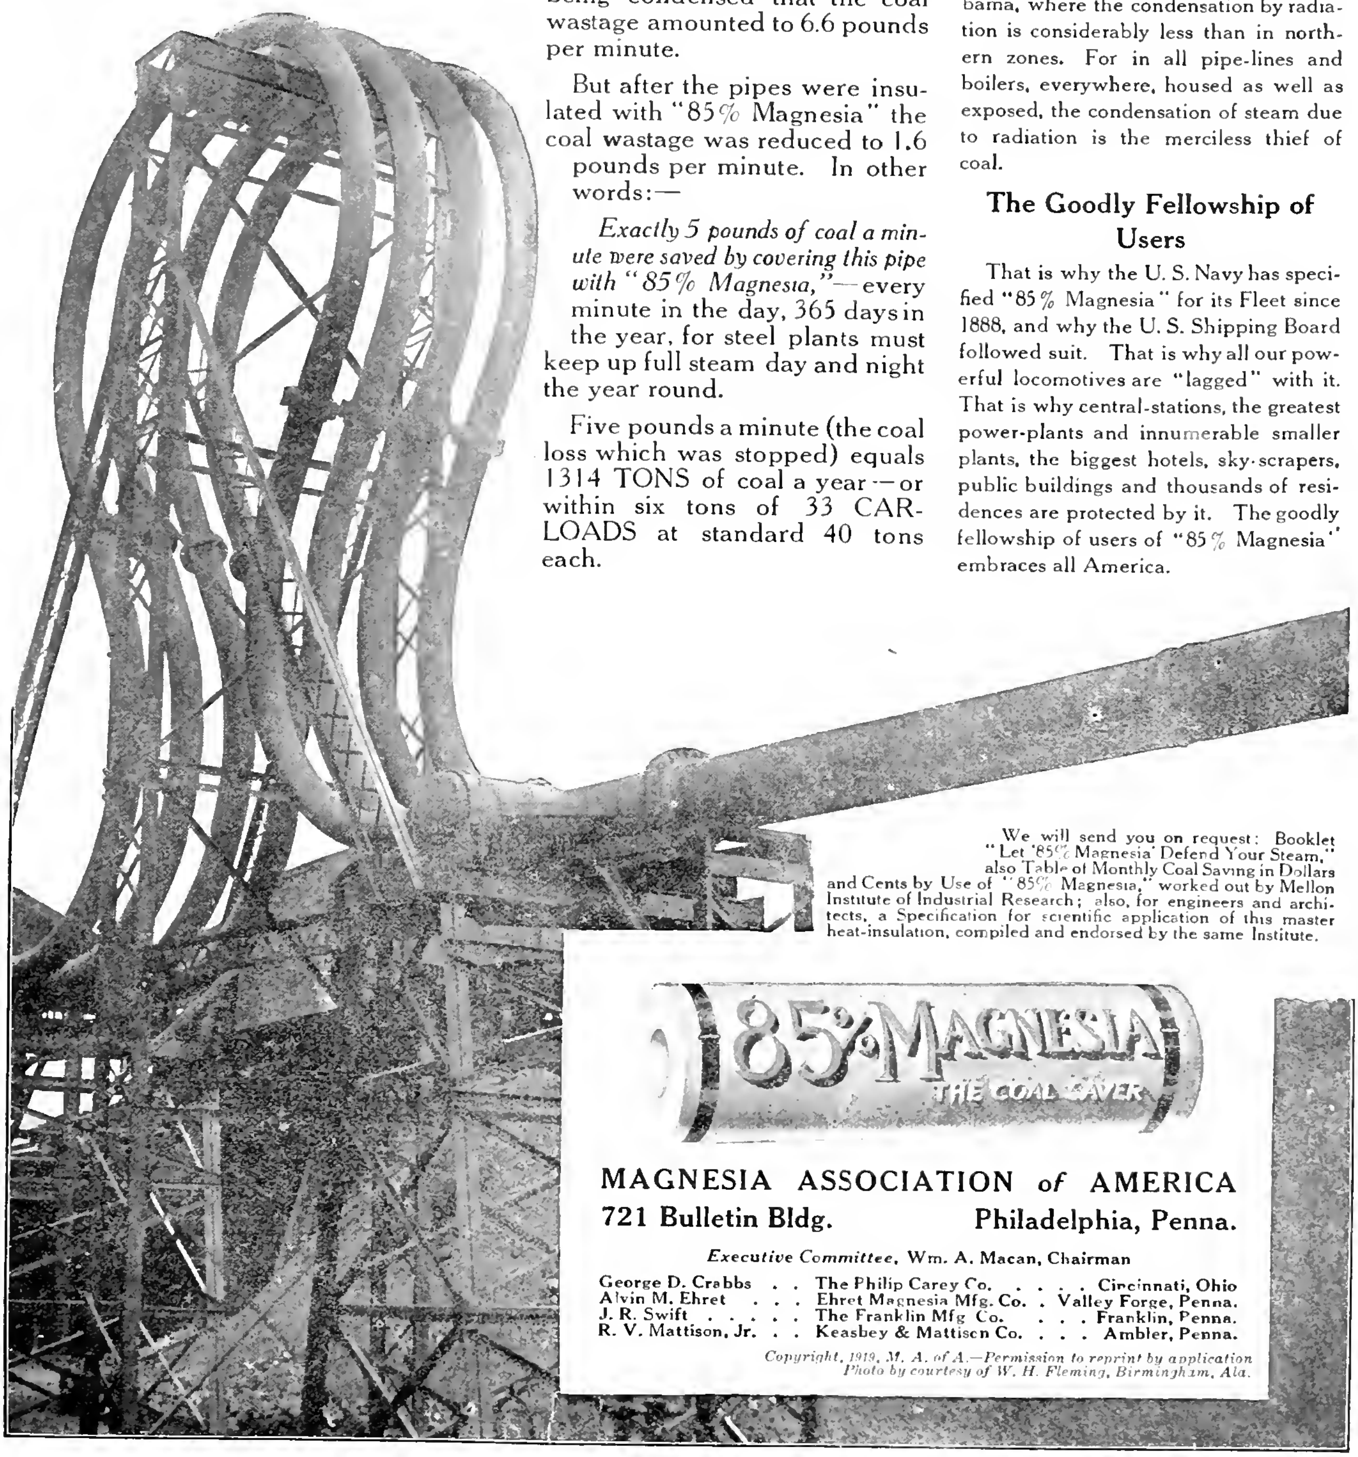
Valves, Exhaust, Pitting

What Causes Pitting of Exhaust Valves? Automotive Industries, vol. 41, no. 10, Sept. 4,

How $1,500 invested in "85% Magnesia" saved 33 carloads of coal a year—

THIS striking picture shows the lofty steam expansion bend of the great outdoor steam pipe-line of the gulf States Steel Company plant at Alabama City, Alabama.

The line is 750 feet long and 22 inches diameter. It carries 150 lbs. of steam. It is insulated with "85% Magnesia" pipe-covering.



On that coal-saving insulation hangs a vitally interesting story.

Before and After

This plant started operations before the "85% Magnesia" coverings were put on. While the pipes were bare, careful tests showed that so much steam was being condensed that the coal wastage amounted to 6.6 pounds per minute.

But after the pipes were insulated with "85% Magnesia" the coal wastage was reduced to 1.6 pounds per minute. In other words:—

Exactly 5 pounds of coal a minute were saved by covering this pipe with "85% Magnesia,"—every minute in the day, 365 days in the year, for steel plants must keep up full steam day and night the year round.

Five pounds a minute (the coal loss which was stopped) equals 1314 TONS of coal a year—or within six tons of 33 CARLOADS at standard 40 tons each.

Or, in Dollars—with coal at only $5.00 a ton, this saving amounts to no less than $6,570 a year in coal, while the outlay for installation was *less than* $1,500.

Arrest the Invisible Thief of Coal

That was under the hot sun of Alabama, where the condensation by radiation is considerably less than in northern zones. For in all pipe-lines and boilers, everywhere, housed as well as exposed, the condensation of steam due to radiation is the merciless thief of coal.

The Goodly Fellowship of Users

That is why the U. S. Navy has specified "85% Magnesia" for its Fleet since 1888, and why the U. S. Shipping Board followed suit. That is why all our powerful locomotives are "lagged" with it. That is why central-stations, the greatest power-plants and innumerable smaller plants, the biggest hotels, sky-scrapers, public buildings and thousands of residences are protected by it. The goodly fellowship of users of "85% Magnesia" embraces all America.

We will send you on request: Booklet "Let '85% Magnesia' Defend Your Steam," also Table of Monthly Coal Saving in Dollars and Cents by Use of "85% Magnesia," worked out by Mellon Institute of Industrial Research; also, for engineers and architects, a Specification for scientific application of this master heat-insulation, compiled and endorsed by the same Institute.

85% MAGNESIA

1919, pp. 476-477. From investigation undertaken in connection with development of Rolls-Royce air-craft engines. Translated from La Technique Automobile et Aérienne.

LUBRICATION

Ball Bearings

The Lubrication of Ball-Bearings, H. R. Trotter. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 811-815, 5 figs. Instrument designed by writer for obtaining data regarding lubricants consists of revolving element driven by small motor and stationary element similar to block used in a Michell or Kingsbury bearing with suitable means of obtaining readings of inclination angle of block to revolving element.

Cutting Lubricants

Cutting Lubricants for Machine Tools, Reginald Trautschold. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 45-47. Table indicating suggested uses of lard oil compounds, soda waters and soluble oils for different machining operations and metals.

Principles

Lubrication Principles, Robert June. Brick & Clay Rec., vol. 55, no. 7, Sept. 23, 1919, pp. 588-591, 2 figs. Writer contends that through a knowledge of how to save power, power-plant operator may save, many times over each year, cost of lubricants; he also considers accurate knowledge of lubricants as vitally important.

MACHINE ELEMENTS AND DESIGN

Bearings, Marine Thrust

Marine Thrust Bearings. Motorship, vol. 4, no. 10, Oct. 1919, pp. 28-30, 6 figs. Phenomena of film lubrication in pivoted-segments type. Paper read before Instn. Naval Architects.

Bearing, Michell Journal

The Michell Journal Bearing. Engineer, vol. 128, no 3322, Aug. 29, 1919, pp. 202-204, 10 figs. Adaptation of principle of bearing which has been employed for thrust blocks of marine engines of more than 10,000,000 hp. to journal bearings.

Bearings, Roller

Roller Bearing Types and Applications—II. Raw Material, vol. 1, no. 6, Aug. 1919, pp. 304-308, 16 figs. Construction features of principal makes.

Cams

Cam Design and Construction, Franklin de R. Furman. Am. Mach., vol. 51, no. 12, Sept. 18, 1919, pp. 569-574, 10 figs. Miscellaneous types, minimum sizes and non-interference. (Continuation of serial.)

Gears, Rawhide

The Strength of Rawhide Gears. Machy. (Lond.), vol. 14, no. 358, Aug. 7, 1919, pp. 559-560, 1 fig. Chart empirically devised and said to give same results as Lewis formula with correction for speed introduced by Carl G. Barth.

Gears, Reduction

A War Time Lesson on Reduction Gears. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 516-522, 15 figs. From investigations conducted at McCook Field, Dayton, Ohio, it is shown that in considering special gearing, such as propeller reductions, usual limitations of standard pitches and angles of obliquity can be departed from to advantage.

Shafting

Theory and Practice in Shafting, Robert S. Lewis. Belting, vol. 15, no. 5, Sept. 5, 1919, pp. 27-31, 4 figs. Development formula for calculating weight.

Special Machine Design

Principles of Special Machine Design. Machy. (Lond.), vol. 14, no. 360, Aug. 21, 1919, pp 616-617. Analysis of functions of special machines and important points to be observed in their design.

MACHINE SHOP

Drives

Machine-Tool Drives: Motors and Controllers, H. W. Tice. Jl. Engrs. Club Philadelphia, vol. 36, no. 171, Feb. 1919, pp. 47-51, 5 figs. Relative merits of a.c. and d.c. motors for planer drives; d.c. performance curves; a.c. performance curves.

Fitting-Shop Practice

Machine and Fitting Shop Practice, Fred Horner. Mech. World, vol. 66, no. 1703, Aug. 22, 1919, p. 86, 3 figs. Chucks in which separate pads or segments are set in place to form gripping jaws. (Continuation of serial.)

Foundations, Machinery

Making Templets for Machinery Foundations, Bruce Page. Power House, vol. 12, no. 12, Aug. 5, 1919, pp. 325-329, 14 figs. Says that templet drawings should be made for all except the simplest foundations and that drawings should be furnished the man who is to build the templet.

Lathe Operations

Machining Operations on Cast Iron Cylinders, Richard Vosbrink. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 406-408, 3 figs. Includes diagrammatic sketch of lathe operations.

Milling

Production Milling on Automatic Machines—I, Edward K. Hammond. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 48-55, 14 figs. Describes practice in milling of duplicate parts.

Monel Metal

Working Monel Metal, Hugh R. Williams. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 509-511, 3 figs. Curves showing influence of temperature on tensile strength and on torsional strength of metal rods.

Optical Methods of Comparison

Some Optical Aids for the Engineer—I, Arthur C. Banfield. Machy. (Lond.), vol. 14, no. 360, Aug. 21, 1919, pp. 613-615, 9 figs. Points out advantages in adopting optical methods for comparison and for other purposes.

Shaft Straightening

Straightening Shaft of 45,000-Kw. Turbine, E. E. Clock. Power, vol. 50, no. 10, Sept. 2, 1919, pp. 377-378, 1 fig. Shaft was straightened by heat-treatment method.

Taylor's "Cutting Metals"

Supplement to Frederick W. Taylor's "On the Art of Cutting Metals"—I, Carl G. Barth. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 169-175, 1 fig. Reviews historical study of work and outlines engineering subjects that are to be treated in subsequent installments.

Thread, Milling

Milling Threads, W. G. Dunkley. Machy. (Lond.), vol. 14, no. 360, Aug. 21, 1919, pp. 631-634, 7 figs. Determination of true form of thread on inclined section.

MACHINERY, METAL-WORKING

Boring Machine

Horizontal Boring Machine. Engineer, vol. 128, no. 3320, Aug. 15, 1919, pp. 162-163, 2 figs. Special feature noted is controlling gear which is said to permit manipulation of machine in such a way that operator can have complete control without moving from one position.

Dividing Attachment

Dividing Attachment for 3½-in. and 4-in. Drummond Lathe, C. Young. Model Engr. & Elecn., vol. 41, no. 953, July 31, 1919, pp. 104-107, 8 figs. Attachment fits on lathe mandrel in place of gear used for screw-cutting, fork engaging with one of studs in extra quadrant and used for carrying intermediate gears.

Edging Rolls

Using Edging Rolls in Breakdown Emergency, W. S. Standiford. Can. Machy., vol. 22, no. 11, Sept. 11, 1919, pp. 271-273, 2 figs. Illustrating set of edging rolls for edging small flat bars on guide mill.

Lathes

Le Blond Multi-Cut Semi-Automatic Lathes. Am. Mach., vol. 51, no. 12, Sept. 18, 1919, pp. 545-550, 10 figs. Specially valuable feature is said to be multiple use of simple lathe tools for more or less complicated jobs of facing or turning.

Sliding-Head Drop-Rail Lathe. Iron Age, vol. 104, no. 11, Sept. 11, 1919, pp. 720-722, 4 figs. Designed to give extra capacity without employing more than one spindle.

Planers

Heavy Machine Equipment at Panama, R. D. Gatewood. Am Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 463-465, 4 figs. Notably planing machine which handles works 96 in. high by 132 in. wide by 24 ft. long.

Saw, Metal

Vertical Metal Saw. Engineer, vol. 128, no. 3320, Aug. 15, 1919, p. 162, 4 figs. Of heavy and powerful construction, outstanding features being angular disposition of saw frame and high speed.

MACHINERY, SPECIAL

Breaker, Coal

Rebuilding the Loree Breaker, W. S. Hutchinson. Coal Age, vol. 16, no. 9, Aug. 28, 1919, pp. 352-354, 6 figs. How coal breaker having capacity of 6000 tons per day was erected in 130 days.

Dredges

Floating Dredge at Western Indiana Gravel Plant, Terre Haute, Ind. Rock Products, vol. 22, no. 17, Aug. 16, 1919, pp. 20-22, 8 figs. Used to remove gravel to depth of 40 ft. below water level.

Grinding Machine

Designing a Special Machine, F. E. Johnson. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 56-59, 6 figs. Illustrating method of procedure by reference to developing special duplex grinding machine as example.

Lathe and Drill Fixtures

Quantity Production by the American Coin Register Company. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 398-400, 9 figs. Lathe and drill fixtures used.

Milling-Machine Attachment

Some Labor-Saving Devices That Have Been Developed in the Moore Shops. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 394-396, 8 figs. Such as attachment for Le Blond milling machine, which is used in making ⅝-in. cut around corners of oil tight hatch frame.

Mine Cars

The Quantity Manufacture of Mine Cars. Metal Trades, vol. 10, no. 9, Sept. 1919, pp. 403-404, 4 figs. Special tools developed for manufacturing Matteson car.

Scales

Tapered-Floor Track Scales, Canadian Pacific Railway. Ry. Rev., vol. 65, no. 10, Sept. 6, 1919, pp. 336-338, 7 figs. Rails are elevated and floor sloped to shed water crosswise.

Screen, Mitchell Vibrating

Description of the Mitchell Vibrating Screen. Salt Lake Min. Rev., vol. 21, no. 11, Sept. 15, 1919, pp. 28-30, 4 figs. Screen cloth is agitated at rate of 3600 vibrations per min. and strikes material with an impact of from 500 to 1000 lb. The motor-actuated vibration is applied continuously to screening area by means of rigid arms or plates, fastened to ends of vibrator casing below.

Trench Machinery

Trench Machinery, A. E. Collins. Surveyor, vol. 56, no. 1436, July 25, 1919, pp. 55-59, 6 figs. Directs attention to machinery applicable to sewer and similar trenches.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Anchor, Cast Steel

Investigation of the Failure of a Cast-Steel Anchor. Iron Age, vol. 104, no. 12, Sept. 18, 1919, pp. 773-774, 4 figs. How hard interior sections were caused by use of charcoal on the riser in a German foundry. From Stahl und Eisen.

Fatigue

The Fatigue of Nickel and Iron Wires When Subjected to the Influence of Transverse Alternating Magnetic Fields, William Brown. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 17, Jan 1917, pp. 163-170, 3 figs. Including also experiments on subsidence of torsional oscillations in wire carrying electric current.

Impact Machines

Experimental Data Obtained on Charpy Impact Machine, F. C. Langenberg. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1471-1499, 21 figs. Results of experiments said to have indicated that material with lower elastic limit, lower tensile strength, slightly higher ductility and lower Brinell hardness has much higher shock strength, as determined by Charpy notched-bar specimen, either tensile or transverse.

Mahogany

Mahogany, and the Recognition of Some of the Different Kinds by Their Microscopic Characteristics, Henry H. Dixon. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 34, Dec. 1918, pp. 431-486, 138 figs. on 23 supplement plates. Examination covered 40 species of trees which yield mahogany.

Metal Testing

New Processes of Mechanical Testing of Metals (Nouveaux procédés d'essais mécaniques des métaux), Charles Frémont. Comptes ren-

dus des séances de l'Académie des Sciences, vol. 169, no. 5, Aug. 4, 1919, pp. 228-231, 5 figs. Tension, compression and impact portable testing machines.

Notched Bar Tests

Impact Tests of Notched Bars (Sur les essais de flexion par choc de barreaux entaillés). A. Cornu-Thénard. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 6, Aug. 11, 1919, pp. 272-275. It is concluded from tests that it is advisable to give notch (1) sufficiently small diameter, maximum recommended being 2 mm. for a 10 x 10 mm. bar, and (2) sufficiently large depth, one-half depth of bar being suggested as advisable practice.

See also Impact Machines.

Sheets, Galvanized-Steel

Galvanised Steel Sheets. Iron & Coal Trades Rev., vol. 99, no. 2688, Sept. 5, 1919, pp. 289-290, 7 figs. Object of investigation was to study from a physical, chemical, microscopic and mechanical point of view the composition and finish of steel sheets and practice connected with their manufacture.

Testing of Materials

The Testing of Materials, Walter Rosenhain. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 508-510. Writer, who is connected with Nat. Physical Laboratory in Teddington, England, makes plea for simple tests of materials and for statement of results in definite, certain and understandable terms.

Tile, Drain, Shale

An Investigation of Tests of Iowa Shale Drain Tile, W. J. Schlick. Iowa State College of Agriculture & Mech. Arts, Bul. 49, Eng. Experiment Station, vol. 16, no. 43, Mar. 27, 1919, pp. 5-55, 16 figs. Scope of investigations covered studies of methods and results of making sodium sulphate tests of pieces from tested drain tile as accelerated tests of resistance to freezing and thawing; methods and results of making artificial freezing ano thawing tests; effects of natural freezings and thawings upon whole tile; rate of absorption and necessary time of immersion in making absorption tests by immersion.

Tubes, Boiler, Testing

The Commercial Testing of Railway Materials, T. H. Sanders. Mech. World, vol. 66, no. 1703, Aug. 22, 1919, pp. 92-93. Testing of tubes for locomotive boilers. (Concluded.) Paper read before Junior Inst. of Engrs.

MECHANICAL PROCESSES

Drill-Chuck Manufacture

Manufacturing a Drill Chuck, Fred R. Daniels. Machy. (Lond.), vol. 14, no. 358, Aug. 7, 1919, pp. 553-557, 11 figs. Methods and fixtures developed in manufacture of "Ettco" drill chuck made by Eastern Tube & Tool Co., Brooklyn, N. Y.

Interchangeable Manufacture

Machine Design in Interchangeable Manufacturing Practice, Earle Buckingham. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 8-11, 1 fig. Function of machine design in promoting economical manufacture on interchangeable basis.

Locks

The Cylinder Lock—I, Ellsworth Sheldon. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, 3 figs. Features of construction.

Painting and Upholstery

Finishing Bodies for Automobiles, C. A. Marston. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 207-211, 10 figs. Organizing operations of painting and upholstering.

Roller-Chain Manufacture

Making Roller Chain—I. Machy. (Lond.), vol. 14, no. 361, Aug. 28, 1919, pp. 645-649, 8 figs. Special machines and fixtures developed in America for making sprocket chain.

Sprocket-Chain Manufacture

Making Diamond Sprocket Chain—II, Edward K. Hammond. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 25-28, 11 figs. Steps in process of assembling. (Concluded.)

Upholstery

See Painting and Upholstery.

MECHANICS

Cams

Technical Study of Mechanisms Operated by Cams (Étude rationnelle des méchanismes commandés par cames), Octave Lepersonne. Revue Universelle des Mines et de la Métallurgie, vol. 2, no. 1, Mar.-Apr. 1919, pp. 433-500, 10 figs. Criticism of Prof. Hartmann's theory as presented in issues of Sept. 30 and Oct. 7, 1905, of Zeitschrift des Verein Deutscher Ingenieure; construction of profile necessary to assure permanent contact between parts of mechanism, with special reference to requirements for operation of valves in internal-combustion engines. (To be continued.)

Deflection of Beams and Rigid Frames

Deflection of Continuous Beams and Rigid Frames, F. E. Richart. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 564-565, 3 figs. Formulæ for computing maximum deflection in case of symmetrical loading and its application value in case of unsymmetrical loading.

Engine Columns Design

The Design of Engine Columns—II, W. K. Wilson. Mech. World, vol. 66, no. 1704, Aug. 29, 1919, p. 102, 3 figs. Side-thrust curves for case of oil engine. (Continuation of serial.)

Moments, Combined Bending and Twisting

Combined Bending and Twisting Moments, Victor M. Summa. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 41-42, 5 figs. Application of Rankine's formula to types of levers or cranks which are keyed or otherwise attached to shafts.

Stresses, Material, Equations

The Equations for Material Stresses, and their formal solution, R. F. Gwyther. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 235-240. Equations based on "Doctrine of Material Stresses" contained in June Phil. Mag., vol. 35, p. 490, 1918, and the solution of these equations in cartesian coordinates.

Struts

On the Stability of Long Struts of Variable Section, Akimasa Ono. Memoirs of the Coll. of Eng., Kyushu Imp. University, Fukuoka, Japan, vol. 1, no. 5, 1919, pp. 395-406, 4 figs. Formula for critical load developed from assumption that moment of inertia varies as *n*th power of distance of section from free end.

MEASUREMENTS AND MEASURING APPARATUS

Balls for Gage Checking

Use of Balls in Measuring, G. C. Haneman. Machy. (Lond.), vol. 14, no. 358, Aug. 7, 1919, pp. 561-562, 2 figs. Illustrating methods of using finished balls for checking gage measurements.

Conductivity of Metals, Thermal

An Apparatus for Determining the Thermal Conductivity of Metals, Gordon B. Wilkes. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 241-243, 1 fig. Consists essentially of a heater, guard ring, two continuous flow calorimeters, and three thermocouples used in measuring temperature of different parts of specimen.

Dynamometers

Calculating Power Requirements for Small Machinery. Machy. (Lond.), vol. 14, no. 361, Aug. 28, 1919, pp. 662-663, 2 figs. Suggested form of indirect-reading dynamometer.

Gages

See Measurements and Measuring Apparatus (Balls for Gage Checking).

Heat Meter

A New Compensated Heatmeter, Charles P. Frey. Chem. Engr., vol. 27, no. 9, Sept. 1919, pp. 215-218, 6 figs. Effect of line and thermocouple resistance eliminated by means of simple operation. Developed at Bureau of Standards.

A New Compensated Heatmeter, Charles P. Frey. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 259-261, 7 figs. Fundamental principle of Harrison-Foote invention explained.

Indicators

Using Indicator on Internal Combustion Engines, Ralph Miller. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 422-423, 2 figs. Cards taken from 23 x 24 in. four-stroke-cycle oil engines running at 150 r.p.m.

Pyrometers

Teaching Pyrometry, O. L. Kowalke. Bul. Am. Inst. Min. & Metallurgical Engrs., no 152, Aug. 1919, pp. 1425-1427. Suggests introducing exercise that will bring out limitations and sources of error in pyrometer employed.

Optical and Radiation Pyrometry, Paul D. Foote and C. O. Fairchild. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1389-1455, 16 figs. General theory, diagrammatic sketches of various types used both in optical pyrometry and in radiation pyrometry, method of using each, and advantages and disadvantages of radiation pyrometry.

Thermo-Electric Pyrometer for Metallurgical Purposes. Metal Industry, vol. 15, no. 9, Aug. 29, 1919, pp. 171 and 173, 2 figs. Indicating methods of maintaining cold junction at constant temperature.

Resistance Thermometry for Industrial Use, Charles P. Frey. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1437-1441, 2 figs. Construction and operation of commercial resistance thermometer.

Tin: An Ideal Pyrometric Substance, E. F. Northrup. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1443-1444. Particularly because of increase of given volume in resistivity with increase in temperature and decrease of given volume in density with increase in temperature.

Thermocouple Installation in Annealing Kilns for Optical Glass, E. D. Williamson and H. S. Roberts. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1445-1453, 3 figs. Essential features of system of temperature control evolved at plant at Pittsburgh Plate Glass Co.

Pyrometer Shortcomings in Glass-House Practice, W. M. Clark and Charles D. Spencer. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1455-1458. Shortcomings due, it is claimed, to lack of standardization of utilitarian type.

Pyrometry and Steel Manufacture, A. H. Miller. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1501-1510. Method considered as best adapted for measuring bath temperature is that of sighting optical pyrometer either on surface of spoonful of metal drawn from furnace or stream poured from spoon. In forge practice best method of measuring temperature is considered to be that of focusing optical pyrometer directly on article to be forged while it is in its heating furnace.

Temperature Indicating and Controlling Systems—III, Franklin D. Jones. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 12-17, 9 figs. Location and protection of thermocouples; prevention of errors in pyrometer readings; apparatus for determining hardening temperatures. (Concluded.)

Scales

Trustworthiness of the Balance Over Long Periods of Time, George Dean. Jl. Chem. Soc., vol. 115-116, no. 681, July 1919, pp. 826-828. Variation of 1.6 mg. detected and attributed to gradual shifting of central knife edge.

Speed Indicators

Electric Speed Indicators, Victor H. Todd. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 421-422, 6 figs. Principle of operation, construction features, method of gearing and application.

See also Tachometers.

The Waltham Speedometer. Autocar, vol. 43, no. 1245, Aug. 30, 1919, p. 333, 4 figs. New instrument for which greater accuracy is claimed and which is operated by air pressure.

Spherometer

A Spherometer of Precision, J. Guild. Sci. Am. Supp., vol. 88, no. 2281, Sept. 20, 1919, pp. 184-185, 3 figs. Designed with a view to obtain greater accuracy in determination of exact point of contact of micrometer leg with surface of lens or flat under examination than is usually obtained with spherometers of existing patterns. Paper read before Optical Soc.

Tachometers

The Van Sicklen Chronometric Tachometer, Frank J. Feely. Aviation, vol. 7, no. 3, Sept. 1, 1919, pp. 137-138, 5 figs. Instrument has dial uniformly graduated from zero to 2500 r.p.m. for complete rotation of pointer, and, like other similar chronometric tachometers, its calibration is controlled by time of its watch unit.

See also Speed Indicators.

Temperature Scales

Thermocouples

See Pyrometers.

Thermometers

See Pyrometers.

Variance of Measuring Instruments

Variance of Measuring Instruments and Its Relation to Accuracy and Sensitivity, Frederick J. Schlink. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 741-764, 7 figs. With

The apprentice says:

"Almost the first tool I ever heard of was a Starrett 'mike.' Somebody pinched Dad's out of his jumper pocket and the fuss he made showed he thought it was *some* tool, even if he had had it close on twenty years.

"When I got into the shop myself, I noticed the toolmakers and everybody who had 'fussy' jobs preferred Starrett Tools.

"There's something about 'em that the fellows like. Yeh! They're accurate and they're convenient, but I guess the fact that the men who make 'em are pretty good mechanics themselves, has something to do with it.

"What? Sure I'm getting me a set of Starrett Tools — I need 'em every day. Yes, I got me one of those seventy-five cent Starrett Apprentice Books, too. It saves me asking the foreman a question every five minutes. Now, when I want to know how to do something, I can look in the book and study it out myself."

Starrett Tools

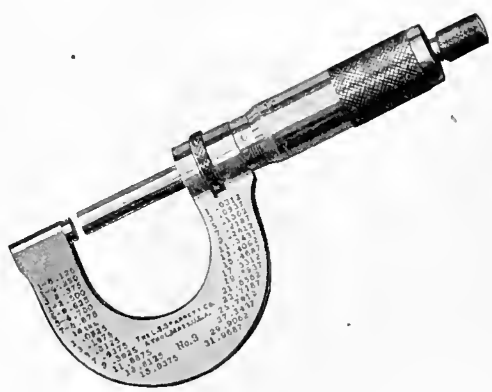
The L. S. Starrett Company

THE WORLD'S GREATEST TOOLMAKERS

Manufacturers of Hack Saws Unexcelled

ATHOL, MASS.

For thirty-nine years Starrett Tools have measured the accuracy of the world's work. Catalogue No. 21 "LD" free upon request.



reference to calibration curves of typical instruments, which are presented to show character of hysteresis loops and nature and amount of various errors as actually determined.

Visibility Measurement

The Low Visibility Phase of Protective Coloration, Loyd A. Jones. Jl. Franklin Inst., vol. 188, no. 3, Sept. 1919, pp. 363-387, 7 figs. Theory upon which measurement and specification of visibility is based; description of instrument to measure visibility. (To be concluded.)

MOTOR-CAR ENGINEERING

Axles

Unusual Types of Axles on the German War Trucks—V, Arthur J. Slade. Automotive Industries, vol. 41, no. 10, Sept. 4, 1919, pp. 457-461, 17 figs. Front axles about equally divided between Elliot and reserve Elliot type. No roller bearings are used. From observations made of trucks handed over to A. E. F.

Berliet

The Berliet Three Tonner. Motor Traction, vol. 29, no. 755, Aug. 20, 1919, pp. 157-158, 6 figs. Lower part of crankcase base chamber made detachable. Engine has bore of 110 mm., stroke of 140 mm., capacity of 1330 cc. per cylinder, and is designed for speeds not exceeding 1250 to 1500 r.p.m.; rated at 22 hp.

Busses

London's New Motor Busses. Motor Traction, vol. 29, no. 756, Aug. 27, 1919, pp. 182-183, 6 figs. Designed with a view to reduce weight, in order to comply with police regulations, though carrying twelve additional passengers.

Connecting Rods

Connecting-Rods for Motor Trucks and Passenger Cars, Fred H. Colvin. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 467-470, 10 figs. Methods of machining, noting especially how concentration of machines eliminates handling of material and fixtures which reduce loss of cutting time.

Garages

Practical Suggestions for the Construction, Equipment and Operation of Automobile Garages (Praktische Vorschläge für den Bau, die Einrichtung und den Betrieb von Automobil-Garagen), Albert Neuburger. Automobil-Rundschau, vol. 18, nos. 7/8, Apr. 1919, pp. 60-70. Heating, illumination and ventilation. (To be continued.)

Impact on Road

Motor-Truck Impact on Roads Five Times Dead Load. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 573-575, 3 figs. Experiments of Bureau of Public Roads said to indicate that force is dependent on speed, power and condition of truck.

Impact Tests of Truck

Effect of Impact of Trucks, E. B. Smith and J. T. Pauls. Mun. Jl. & Public Works, vol. 47, no. 11, Sept. 13, 1919, pp. 162-164, 3 figs. Tests being made by Bur. of Public Roads indicate that there is general tendency of increased impact with higher speeds although relation between speed and impact is not constant; also general increase of impact with increase of height of drop.

Plows

Tractor Ploughing Machine of Unique Design, J. H. Rogers. Can. Machy., vol. 21, no. 11, Sept. 18, 1919, pp. 293-296, 9 figs. Particular advantage claimed is that a plurality of plows can be carried by tractor, entire mechanism of machine being operated by tractor motor located on front end of framework.

Springing Device

A New Springing Device, W. Gordon Aston. Autocar, vol. 43, no. 1234, Aug. 16, 1919, pp. 244-245, 1 fig. Shocks met through variable leverage toggles by coil springs.

Springs, Auxiliary

Supplemental Springs for Metal Tired German Trucks, Arthur J. Slade. Automotive Industries, vol. 41, no. 9, Aug. 28, 1919, pp. 409-412, 14 figs. Made necessary on account of substitution of steel for rubber tires.

Tractors

Automotive Manufacturers Developing French Tractors, W. F. Bradley. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 526-529, 5 figs. Influence of war tank design in new tractors developed recently for France.

Wheels

Wheels for Power Vehicles (Das Kraftwagenrad), K. Bilau. Automobil-Rundschau, vol. 18, no. 7/8, Apr. 1919, pp. 71-74, 3 figs. Strength, light weight and resistance to various temperatures are some of their requirements.

PIPE

Wood-Stave Pipe

Kipawa Co.'s Pulp Mill and Power Development. Can. Engr., vol. 37, no. 12, Sept. 18, 1919, pp. 305-310, 16 figs. Noting details of wood-stave power pipe line 8 ft. in diameter.

Diagram for Computing Band Spacing for Wood-Stave Pipe, Willis T. Batcheller. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, p. 472, 1 fig. For pipe 1 to 20 ft. in diameter, under heads of from 10 to 200 ft. and for band diameters of $\frac{3}{8}$ to $1\frac{1}{4}$ in.

POWER GENERATION

Chesapeake and Ohio Power Plant

Chesapeake and Ohio Power Plant, C. L. Humphreys. Nat Engr., vol. 23, no 9, Sept. 1919, pp. 423-425, 3 figs. Plant supplies steam, air and electric power for general repair shops employing about 2500 men.

Gas Works Power Plant

Gas Works Power Plants, H. C. Widlake. Gas Jl., vol. 147, no. 2935, Aug. 12, 1919, pp. 336-338, 3 figs. Economical aspect of substituting steam engine for electric motor in gas works.

Government Ownership

Government Ownership of Water Powers and Electrochemical Industry, F. A. J. FitzGerald. Gen. Meeting Am. Electrochem. Soc., Paper no. 24, Sept. 23-26, 1919, pp. 305-317 and (discussion) pp. 317-328. Arguments advanced by advocates of government ownership are judged to be a priori and not based on actual experience. Examples of governmental activities in fields which can be undertaken by private enterprise are considered as offering evidence strongly against public ownership in such cases.

Interconnecting Systems

Developing Hydroelectric Power Sites. Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 806-808, 2 figs. Advantages of interconnecting systems.

United States

Growing Demand for Industrial Power, L. W. Alwyn-Schmidt. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, pp. 774-776, 2 figs. Statistical data gathered in U. S. and their economical significance.

Power Systems of the North Central States, Chester H. Jones. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 342-347, 9 figs. Statistics of present development and estimated figures of possible utilization.

POWER PLANTS

Boiler Rooms

Boiler-Room Economy in Small Plants, M. B. Watson. Elec. News, vol. 28, no. 17, Sept. 1, 1919, pp. 27-28. Suggestions in regard to making systematic records. (To be concluded.)

Coal and Wood Furnaces Under Stirling Boilers. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 414-417, 5 figs. Boiler plant where it is said, \$25,000 saving in coal per year is effected.

Coal Handling

Equipment for Handling Coal and Ashes in Power Plants, Robert June. Elec. Rev., vol. 75, no. 12, Sept. 20, 1919, pp. 481-483, 3 figs. Influence of methods upon plant operation; classification of mechanical methods of handling coal and ashes; power calculations.

Condenser Tubes

Life of Brass Condenser Tubes, Guy D. Bengough and O. F. Hudson. Sci. Am. Supp., vol. 88, no. 2274, Aug. 2, 1919, pp. 75-77. Results of study of actions of certain metals in distilled and sea water, and possible protective measures. Summary of report to Inst. of Metals.

Edgewater Power House

Edgewater Power House in Operation. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, pp. 753-760, 11 figs. Source of energy supply for North Central Ohio. Coal- and water-handling systems and method of reclaiming heat losses described as interesting installation features.

Exhaust Steam, Utilization of

Conservation of Coal by Saving Exhaust Steam in the Textile Industries, William B. Hoyt. Jl. Am. Soc. Heat. and Vent. Engrs., vol. 25, no. 2, Apr. 1919, pp. 119-122. Recommendations for effecting conservation in felt mills, woolen mills and knitting mills.

Firing

Saving Coal in Power Plants. Universal Engr., vol. 29, no. 6, June 1919, pp. 32-37, 1 fig. Chief losses in boiler plant operation are said to be due to (1) dirty boiler, (2) leaky setting, (3) poor firing.

Oil Burners

Influence of Load Pressures of Oil and Atomizing Steam in Oil Burners, C. R. Weymouth. Jl. Electricity, vol. 43, no. 5, Sept. 1, 1919, pp. 218-220, 7 figs. Charts showing results of test data in relationship of oil and steam pressures, which results in greatest boiler efficiency.

Records

Boiler- and Engine-Room Record Sheets, P. R. Duffey. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 461-463, 3 figs. Illustrating various forms which are said to have been found serviceable in actual operation.

Stacks

Experiments on Stack Performance, Julian C. Smallwood. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 464-467, 2 figs. Comparison of experimentally determined temperatures, velocities and pressures with values assumed and results calculated in design.

Stand-By Operation

Converting a Steam Plant to Stand-by Operation, L. M. Klauber Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 815-817, 2 figs. Enumeration of problems encountered following tie-in with transmission service. From paper read before Pac. Coast Section, Nat. Elec. Light Assn.

Superheated Steam

Industrial Uses of Superheated Steam, Alexander Bradley. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 2, Apr. 1919, pp. 123-132, 6 figs. Including results of comparative tests conducted by Engineering Dept. of Standard Oil Co. on oil pumping engines with saturated and superheated steam.

Vacuum

Vacuum—II, Roger Taylor. Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 809-812, 6 figs. Advantages of low pressure; controlling conditions.

PRODUCER GAS

Ammonia in Producer Gas

Ammonia in Producer Gas, F. K. Ovitz. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 253-255. Tests made at factory of Hazel-Atlas Glass Co., Washington, Pa., to determine amount of ammonia in gas from producers of Smith type.

Producer-Gas Engines

The Gorham Producer Gas Engine. Pac. Mar. Rev., vol. 16, no. 9, Sept. 1919, pp. 149-152, 4 figs. Arranged for running in either direction, reversal being accomplished by use of compressed air furnished by compressor mounted on and forming part of engine.

Smith Producer Plant

Producer Gas Traction. Gas and Oil Power, vol. 14, no. 168, Sept. 4, 1919, pp. 178-180, 5 figs. Description of the Smith producer plant.

PUMPS

Control

Automatic Pump Control, B. N. Everett, Power, vol. 50, no. 13, Sept. 23, 1919, pp. 496-499, 14 figs. Illustrating arrangements of automatic pump-control apparatus for motor- and belt-driven power pumps, of both plunger and centrifugal types.

Quarry Service

Pumps in Quarry Service—I. Stone, vol. 40, no. 7, July 1919, pp. 311-313. General requirements in American quarries.

Turbine Pump, Electric

Economical Pumping by New Application of Electric Turbine Pump, H. Hughes. Iron & Coal Trades Rev., vol. 99, no. 2685, Aug. 15, 1919, pp. 210-211, 4 figs. Installation at Nantgarw colliery which is 860 yd. deep, for pumping 10,000 gal. of water per hour.

Vacuum Pumps

A Volumetric Efficiency Test of a Vacuum Pump, George S. Tayman. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 823-824. Pump tested was Laidlaw-Dunn-Gordon duplex dry-vacuum pump, size 18 in. by 12 in., when operating under different intake and discharge pressures.

Weir, Turbo-Feed Pump

The Weir Turbo-Feed Pump. Iron & Coal Trades Rev., vol. 99, no. 2685, Aug. 15, 1919, p. 203, 4 figs. Of impulse type with one pressure and several velocity stages.

REFRACTORIES

Haydite

Prominent Clay Men Organize to Make New Building Material. Brick & Clay Rec., vol. 55, no. 6, Sept. 9, 1919, pp. 484-487, 2 figs. Historical account of development and outline of physical properties of "Haydite."

REFRIGERATION

Boyle Curve

See Refrigerating Machinery.

Code, Refrigerating

Proposed Refrigerating Code. Power Plant Eng., vol. 23, no. 18, Sept. 15, 1919, pp. 825-827, 2 figs. As outlined for municipal and State regulations for refrigeration machines and plants. Approved by Council of Am. Soc. Refrig. Engrs.

Dehydration

Dehydration in Absorption Machines. John E. Starr. Refrig. World, vol. 54, no. 9, Sept. 1919, pp. 11-12. Suggests keeping gas between the dehydration and condenser at temperature 8 or 10 deg. above temperature corresponding to pressure actually existing in condenser.

Food Storage

Cold Storage of Food—I and II, Ingrar Jorgensen and Walter Stiles. Sci. Am. Supp., vol. 88, nos. 2279 and 2281, Sept. 6 and 20, 1919, pp. 150-151 and 178 and 192. Sept. 6: Technical considerations involved in developing appropriate types. Sept. 20: Concerning physical changes in meat preserved by cold storage. (From Science Progress, London.)

Packing Houses

Refrigerating Troubles in a Packing House Plant. J. C. Moran. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 459-461, 2 figs. Remedying troubles due to inadequate cooling coil surface.

Refrigerating Machines

The Compression Refrigerating Machine, Gardner T. Voorhees. Ice & Refrigeration, vol. 57, no. 3, Sept. 1919, pp. 93-95, 1 fig. Construction and significance of Boyle Curve. (Continuation of serial.)

See also Testing.

Refrigerating Plants

Getting a Refrigerating Plant Out of a Critical Situation. J. C. Moran. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 429-430, 1 fig. Additional capacity secured by connecting individual branches to each of three ammonia compressors from top of main line instead of bottom.

Testing

Rules for Testing Compression Refrigerating Plants (Regeln für Leistungsversuche an Kompressions-Kühlanlagen). Karl Fehrmann. Zeitschrift für die gesamte Kälte-Industrie, vol. 26, no. 4, Apr. 1919, pp. 25-28. Testing efficiency of evaporator; power consumption of condenser; water consumption of liquefier; power consumption of pumps, agitator, etc.

RESEARCH

Chemical Research

Research and Application. Wm. H. Nichols. Science, vol. 50, no. 1288, Sept. 5, 1919, pp. 217-224. Illustrating by survey of chemical progress how research work has furthered scientific development. Also notes on appreciation of its importance by associations and organizations, principally Am. Federation of Labor. Paper read before Am. Chem. Soc.

Universities

The New Opportunity in Science. R. A. Millikan. Science, vol. 50, no. 1291, Sept. 26, 1919, pp. 285-297. Argues that universities cannot possibly fulfill their function of selecting and developing scientific men of outstanding ability unless they create within themselves the atmosphere of scientific research.

STANDARDS AND STANDARDIZATION

Economies

Industrial Viewpoint on Standardization. E. E. George. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 635-636. Instances emphasizing economies resulting from fixing standards.

Engineering Standards Committee

Engineering Standards Committee Proposes New Constitution. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 575-576. New draft provides for taking in other societies on equal basis and association plan for outside financing dropped.

Glassware Laboratory

Report of the Committee on the Standardization of Laboratory Glassware. Jl. Soc. Chem. Indus., vol. 38, no. 15, Aug. 15, 1919, pp. 280R-285R, 2 figs. Metric dimensions and capacities of accepted standards for cylindrical beakers, flasks, funnels, drying towers and graduated operators.

Pyrometer Standardization

Metals for Pyrometer Standardization, Charles W. Waidner and George K. Burgess. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1511-1512. Summary of work done by Bureau of Standards, with table giving values of freezing points and purity of standard pyrometric metals.

Standard Determination

Standardisation. J. Fearn. Managing Engr., vol. 6, no. 4, Aug. 1919, pp. 83-86 and discussion pp. 86-90. Necessity of conducting research work for determining standards.

Steel Standards

Foreign Steel Standards Compared to Ours —I, F. F. Macintosh. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 432-434. Although American practice is said to outstrip foreign competition in tonnage and cost, higher quality is considered as predominant characteristic of European steel.

STEAM ENGINEERING

Bleeder Turbines

The Bleeder Turbine, Josef Y. Dahlstrand. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, pp. 762-768, 13 figs. Its use, design and construction.

Boilers

An Improved Steam Boiler. Am. Marine Eng., vol. 14, no. 9, Sept. 1919, pp. 20-21, 3 figs. Primary object of invention is to obtain maximum steaming capacity for given area of grate surface, water passages being so arranged that proper circulation of water is insured and liberation of steam facilitated.

Boilers, Cleaning

How Much Fuel Does a Clean Boiler Save? W. F. Schaphorst. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 456-457, 1 fig. Chart for determining fuel saved by clean boilers.

Boiler Fittings

Fittings for Steam Boilers—I, Edward Ingham. Colliery Guardian, vol. 118, no. 3060, Aug. 22, 1919, p. 489. Concerning arrangement of safety valves on large boilers.

Boiler Plugs, Fusible

Tin Fusible Boiler-plug Manufacture and Testing, L. J. Gurevich and J. S. Hromatko. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1351-1360, 5 figs. From tests at Bureau of Standards, precautions to be taken in manufacture of fusible plugs are recommended, notably that pig tin should be at least 99.7 per cent pure, containing not more than 0.1 per cent lead, or 0.1 per cent zinc, which are requirements of Steamboat Inspection Service.

Boilers, Low-Pressure

Code for Testing Low Pressure Heating Boilers. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 2, Apr. 1919, pp. 212-214, and (discussion) pp. 215-218. Revision of form accepted by Soc. of Heat. & Vent. Engrs. in Jan. 1918.

Cracking of Cast-Iron Sectional Hot-Water Boilers, Charles R. Honlball. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 2, Apr. 1919, pp. 133-140. Results of investigations claimed to point out that to avoid cracking it is necessary to provide for easy and equable working, avoidance of air locks or steam formation, continuous circulation and avoidance of deposit.

Boilers, Superheated-Steam

Boiler for Compound Superheater Engines, Midland Railway. Ry. Engr., vol. 40, no. 476, Sept. 1919, pp. 186-190, 13 figs. Constructed for working pressure of 225 lb. per sq. in., but safety valves for compound engines are adjusted to blow off at 190 lb. per sq. in.; firebox of Belpaire type with inclined grate.

Boilers, Water-Tube

The Cross Drum Type Heine Water Tube Boiler. Mar. Eng. & Can. Merchant Service Guild Rev., vol. 9, no. 8, Aug. 1919, pp. 271-273, 3 figs. Particularly as fitted in ships of United States Emergency Fleet.

Turbines

Low-Pressure Turbines in Forge Shops, H. V. Schoepflin. Power, vol. 50, no. 12, Sept. 16, 1919, pp. 450-453, 6 figs. Economy of utilizing exhaust steam from hammers instead of wasting it to atmosphere. Details of apparatus required and problems to be considered in application.

Refinements in Turbine Design, A. G. Christie. Power, vol. 50, no. 10, Sept. 2, 1919, pp. 362-364, 4 figs. Article deals with forms of throats and mouths of nozzles, polished surfaces for diaphragms and thickness of blade edges.

Steam Turbines and Gears for Marine Service. Power, vol. 50, no. 11, Sept. 9, 1919, pp. 424-426, 4 figs. Greater speed for given weight of power plant, less operating expense, greater reliability, saving in fuel and greater efficiencies claimed as principal advantage of turbine drive with reduction gear for ship propulsion.

Valves, Drop

Notes on Drop Valves for Steam Engines, H. W. Morley. Sci. Am. Supp., vol. 88, no. 2280, Sept. 13, 1919, pp. 164-165, 4 figs. Results of experience with slow-speed land engines discussed in their significance to designing other types.

THERMODYNAMICS

Heat Interchangers

Heat Interchangers (Echangeurs de chaleur), G. Bastien. Mémoires et compte rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, no. 4, 5 & 6, Apr.-June 1919, pp. 183-237, 3 figs. Theoretical analysis of phenomena taking place in heat interchangers operating by contact of two fluids with separating medium.

Latent-Heat Formulæ

Latent Heat and Surface Energy—I, D. L. Hammick. Lond., Edinburgh & Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 240-245. Expression connecting internal latent heat and surface energy, and discussion of its agreement with available data.

WELDING

Aluminum

New Method for Soldering Aluminum (Ein neues Verfahren zum Löten von Aluminum). Autogene Metallbearbeitung, vol. 12, no. 4, Apr. 1919, pp. 57-62, 12 figs. Method employs "Foramus" solder, which is made in bars 4, 7 and 10 mm. thick and can be used for soldering sheets, pipes, aluminum with copper; material is also made in a special quality with low melting point for repairing delicate aluminum parts.

Boiler Welding

Standard Boiler Welding. Welding Engr., vol. 4, no. 9, Sept. 1919, pp. 21-25, 27 figs. Oxy-acetylene and electric welding on the Kansas City Southern Railroad.

The A. C. System of Arc Welding. Engineer, vol. 128, no. 3322, Aug. 29, 1919, pp. 213-214, 4 figs. With exposition of advantages claimed for this system.

Jigs

Welding Jigs and How to Overcome Distortion, C. S. Milne. Can. Machy., vol. 22, no. 9, Aug. 28, 1919, pp. 228-229, 2 figs. Illustrating welding fracture in rim of cast iron gear wheel to transmit 240 hp. (Concluded.) Paper read before British Acetylene & Welding Assn.

Oxy-Acetylene Welding

The Judgment of the Oxy-Acetylene Process, Alfred S. Kinsey. Can. Machy., vol. 22, no. 11, Sept. 11, 1919, pp. 280-281. Sees process as engineering success and fine commercial asset.

Oxy-Hydrogen Gas Welding

Oxy-Hydrogen Gas — Its Uses at the J. I. Case Threshing Machine Company, Manufacturers of Tractors and Farm Implements, Charles Kandel. Am. Gas Eng. Jl., vol. 111, no. 11, Sept. 13, 1919, pp. 219-222, 5 figs. Purity of gases produced insures maximum efficiency for cutting and welding parts of Case farm-implement products.

Weld Production

Some Interesting Welds (Einige interessante Schweissarbeiten). Autogene Metallbearbeitung, vol. 22, no. 7/8, Apr. 1919, pp. 31-32, 6 figs. High-pressure distributor; cooling aggregate; pressure cylinder; tank car for high-pressure gases.

Repairing Engine Cylinders by Autogenous Welding (Ueber die Ausbesserung schadhafter Motorzylinder mittels der autogenen Schweissung). Autogene Metallbearbeitung, vol. 22, no. 7/8, Apr. 1919, pp. 27-30, 2 figs. Preventing hard seams and dripping of iron from welds. (To be continued.)

Wrought-Iron Welding

Welding Wrought Iron and Steel, H. L. Unland. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 581-582. Suggestions in regard to practical procedure.

Your Responsibility

You, as an Engineer, have the opportunity of playing an important part in the solution of present industrial conditions.

The crying need of this country and the world is for Increased Production. More things per capita must be produced if prices are to come down and conditions return to a normal basis. And this in the face of the demands of labor for shorter hours.

There is one solution and only one—IMPROVED MACHINERY. And here lies your opportunity and responsibility.

It is up to every Engineer to redesign, refine and improve the machinery for which he is responsible. He should study and utilize the best and most modern tendencies in design to assure the desired result—increased production from the machines.

Durable Hyatt Roller Bearings are a logical part of all Improved Machinery—Machinery designed for Maximum Production. Their use makes machinery dependable, insures continuous operation and eliminates shutdowns for repairs. Hyatt Roller Bearings keep a machine at its job—production.

As an Engineer, you are responsible for the design of this Improved Machinery. You should carefully investigate the increased production made possible by the use of Hyatt Roller Bearings.

Send for our latest engineering data covering the class of machinery in which you are interested.

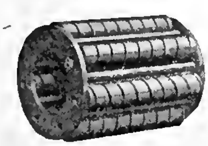
Hyatt Roller Bearing Company

INDUSTRIAL BEARINGS DIVISION

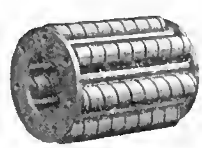
Metropolitan Tower, New York City

MOTOR BEARINGS DIVISION
DETROIT, MICHIGAN

TRACTOR BEARINGS DIVISION
CHICAGO, ILLINOIS



Manufacturers of Bearings for Mine Cars, Ore Cars, Steel Mill Cars, Roller Tables, Trolleys, Cranes, Hoists, Machine Tools, Line Shafts, Countershafts, Concrete Machinery, Textile Machinery, Conveyors, Lift Trucks, Industrial Trucks, Railway Service Cars, Storage Battery Locomotives, etc.



WOOD

Laminated Wood

Reducing Shrinkage and Swelling in Laminated Wood Construction, J. S. Mathewson. Aviation, vol. 7, no. 3, Sept. 1, 1919, p. 140. Remarks based on experimental research conducted at U. S. Forest Products Laboratory.

Organization and Management

ACCOUNTING

Accounting Methods

Importance of Proper Accounting in the Maintenance of Way Department in General, I. A. May. Street Ry. Bul., vol. 19, no. 9, Sept. 1919, pp. 329-335, 5 figs. Details as to reports, time slips, data cards, etc., used by The Connecticut Co., New Haven, Conn.

Appraisals

Practice in Making Electric Utility Appraisals, Charles W. McKay. Elec. Rev., vol. 75, no. 11, Sept. 13, 1919, pp. 428-433. Discussion of value of unit costs and necessity for care in their preparation.

Unit Costs for Use in Public Utility Appraisals, R. L. Baldwin. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 514-516, 1 fig. Method at present employed by many commissions described as combination of "reproduction cost with unit prices based upon average prices," and "actual cost from records."

Classification of Expenses

Protection of Owners on Cost-Plus Contracts, F. A. Wells. Can. Engr., vol. 37, no. 13, Sept. 25, 1919, pp. 323-326, 4 figs. Practical use of Dewey Decimal System in keeping books on the job; classification of plant expense and field overhead.

Cost Accounting

Uniform Cost Accounting in Shipbuilding—II, J. L. Jacobs. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 638-640. Plan adopted by Atlantic Coast Shipbuilders' Assn. for uniform method of cost accounting in steel shipbuilding.

A Cost System for Shipyards—III, Creighton Churchill. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 641-642. 1 fig. How the system is operated; practical application in the case of a hull under construction or under contract.

Costing

Costing in Relation to Scientific Management, J. H. Boyd. Elecn., vol. 83, no. 2152, Aug. 2 1919, pp. 171-172. Results obtained at various works.

The Necessity of Knowing Manufacturing Costs, Roland H. Zinn. Am. Industries, vol. 20, no. 2, Sept. 1919, pp. 20-21. Points out that unless exact cost of each department is known, waste of materials, inefficient help, or careless supervision in buying will not be reported.

The Philosophy of Costs, C. E. Knoeppel. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 179-183. Importance of determining hourly performance of labor illustrated by various instances in which efficiency was increased by recording it regularly, notably experience of one company in which efficiency in one department increased production 60 per cent by displaying graphically from day to day actual hourly production against predetermined hourly production.

Do You Know Exactly What Your Product Costs? Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 101-106, 5 figs. Illustrating instances showing how planning costs worked out; comparison chart for engines built during 1917-1918.

Cost Factors

Summarizing All Cost Factors, M. H. Potter. Iron Trade Rev., vol. 65, no. 10, Sept. 4, 1919, pp. 630-631, 6 figs. Suggested method for determining basis for fixing of selling price.

Inventories

Inventorying Materials and Supplies, B. J. Yungbluth. Elec. Ry. Jl., vol. 54, no. 11, Sept. 13, 1919, pp. 518-520, 2 figs. How Pittsburgh Railways Co. inventoried in two days, at cost of $239.85, 8613 different kinds of materials valued at $916,317, without special help of overtime of employees.

EDUCATION

Army Trade Tests

The Army Trade Tests, William T. Bawden. Dept. of Interior Bur. of Education, Circular no. 4, Apr. 1919, 28 pp., 8 figs. Report of a conference of specialists in industrial education, called by the U. S. Commissioner of Education.

Factory School

The Factory School as an Americanizing Force, T. A. Levy. Am. Industries, vol. 20, no. 2, Sept. 1919, pp. 23-24. From address at Americanization Congress under auspices of Assn. Industries of Mass.

Training Factory Help

Possibilities in Training Factory Help, James F. Johnson. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 221-224, 2 figs. Proposed as remedy for labor shortage.

EXPORT

British Machine Tool and Metal Industries

British Machine Tool and Metal Industries, Alexander Luchars. Machy. (N.Y.), vol. 26, no. 1, Sept. 1919, pp. 19-24. Report of U. S. Trade Commissioner to Great Britain and Continental Europe appointed by U. S. Dept. of Commerce, for purpose of studing conditions affecting sale and use of American machine tools and accessories in European market. Also in Am. Mach., vol. 51, no. 10, Sept 4, 1919, pp. 478-480.

Cement

International Trade in Cement. Cement, Mill & Quarry, vol. 15, no. 5, Sept. 5, 1919, pp. 19-23. Statistics of imports into other countries. Export opportunities for American producers. Third article.

China

China as Market for Railway Materials, Frank Rhea. Ry. Rev., vol. 65, nos. 9 and 11, Aug. 30 and Sept. 13, 1919, pp. 289-294 and 371-376, 23 figs. From Far-Eastern Markets for Railway Materials, Equipment and Supplies, Special Agents' Series no 180, published by Dept. of Commerce, Bureau of Foreign and Domestic Commerce. Operating methods; track materials and maintenance; general characteristics of rolling stock.

East Indies, Dutch

Dutch East Indies Offer Many Construction Opportunities, J. W. Evans. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 497-498. Developments now under way or in prospect in Sumatra and Java include port works, railroads and waterpower.

Signaling Apparatus

Opportunities for American Signaling in Far East, Frank Rhea, Ry. Age, vol. 67, no. 12, Sept. 19, 1919, pp. 557-558. Urges that American firms must recognize differences in operating methods to compete successfully.

FACTORY MANAGEMENT

Bar Steel, Identification

Identification of Bar Steel. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 36-38. Method employed by Rockford Drilling Machine Co., which consists in painting streaks of different colors laterally and transversely on side of bars.

Construction Work, Chart for

A Useful Progress Chart for Construction Work. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, p. 769, 1 fig. Employed during construction of Edgewater power station for determining percentage of work already done on any particular job as well as percentage of work remaining unfinished, and estimated length of time required to complete work.

Controlling Production

A System for Controlling Production, Robert H. Wadsworth. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 451-455, 12 figs. Forms used are illustrated and their functions discussed.

Drawing Office

Drawing Office and Workshop Organization, N. Gerard Smith. Eng. & Indus. Management, vol. 2, no. 9, Aug. 28, 1919, pp. 259-263, 11 figs. Concerning filing of technical data and routine for tool supply.

Employment Department

Adjusting the Employment Department to the Rest of the Plant, Dwight T. Farnham. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 201-205, 3 figs. Suggested standard-practice instructions for employment determined.

Follow-up Plants for Production

Keeping Production on Schedule, S. P. Keator. Factory, vol. 23, no. 3, Sept. 1919, pp. 510-511, 6 figs. Suggested follow-up plan for small plants

Foremen

The Foreman in Relation to Workshop Organization, A. Robert Stelling. Eng. & Indus. Management, vol. 2, no. 10, Sept. 4, 1919, pp. 294-295. Comparison of American and English practice in management of workshops.

Foundry

See Production Methods.

Industrial Relationships

Industrial Relationship, Bass Smith. Am. Mach., vol. 51, no. 10, Sept. 4, 1919, pp. 471-472. Qualifications of industrial management.

Industrial Welfare, Edgar L. Collis. Eng. & Indus. Management, vol. 2, no. 10, Sept. 4, 1919, pp. 309-311. Welfare is considered as "an inevitable development of modern industry, necessary to enable it to do its duty by its employees," and it is pointed out that welfare work "must cover outside activities, such as recreation, transport and housing questions."

Inspection, Electrical

Organizing Electrical Inspection and Maintenance, C. A. Cowdery. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 645-649, 4 figs. Method carried out in one of large industrial plants in New England while factory was employed on war work exclusively and operated 24 hr. daily excepting Sundays.

Machine-Tool Plant

Organization and Management of a Machine Tool Plant—III. Machy. (Lond.), vol. 14, no. 358, Aug. 7, 1919, pp. 565-569, 9 figs. Manufacturing departments and systems recommended for medium-size machine-tool-manufacturing plant making a single line of machines.

Motor-Transport Business

Starting in the Motor Transport Business. Motor Traction, vol. 29, no. 758, Sept. 10, 1919, pp. 219-222. What it costs and what it brings in.

Motion Analysis

Graphic Methods of Analysing Motions. Eng. & Indus. Management, vol. 2, no. 8, Aug. 21, 1919, pp. 229-232, 2 figs. Charts illustrating simultaneous cycle motion of lowering pig iron upon a railway truck and action of workman in leaving his work.

Planning

The Production Planning System of the Heald Machine Company—II, W. S. Pratt. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 501-508, 11 figs. Planning board and method of following work.

A Planning Department System in Use in a Machine Shop, John H. Black. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 225-229, 2 figs. Viewpoint around which planning department is said to be built is necessity of knowing at all times "what is still needed" and how to make up actual or impending shortage.

Planning the Industrial Plant—IV, Hugh M. Wharton. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 237-241, 5 figs. Material handling, fire protection, toilets and lavatories, power transmission, heating, ventilation and illumination. (Concluded.)

Production Methods

Continuous Movement in the Essex Production Line, J. Edward Schipper. Automotive Industries, vol. 41, no. 9, Aug. 28, 1919, pp. 416-421, 10 figs. partly on supplement plate. Engine, chassis, and body treated as separate units until delivered complete at final assembly line.

Increased Output with Reduced Hours of Work, Chas S. Myers. Eng. & Indus. Management, vol. 2, no. 8, Aug. 21, 1919, pp. 227-229. Study of improved methods in an iron foundry.

Installing Management Methods in the Woodworking Industry, Carle M. Bigelow. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 185-195, 24 figs. Preparing orders, determining upon stock and material, laying out progress of work, making out production orders, preparing standard instructions, using control board, handling job cards and inspection records and computing labor efficiency, are described and illustrated by drawings and forms.

Machinery Versus Trained Brains, Lazarovich-Hrebelianovich. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 198-200. War experience of company which after losing its trained workers failed to increase its production efficiency even after having spent $200,000 in important machinery for use of new employees.

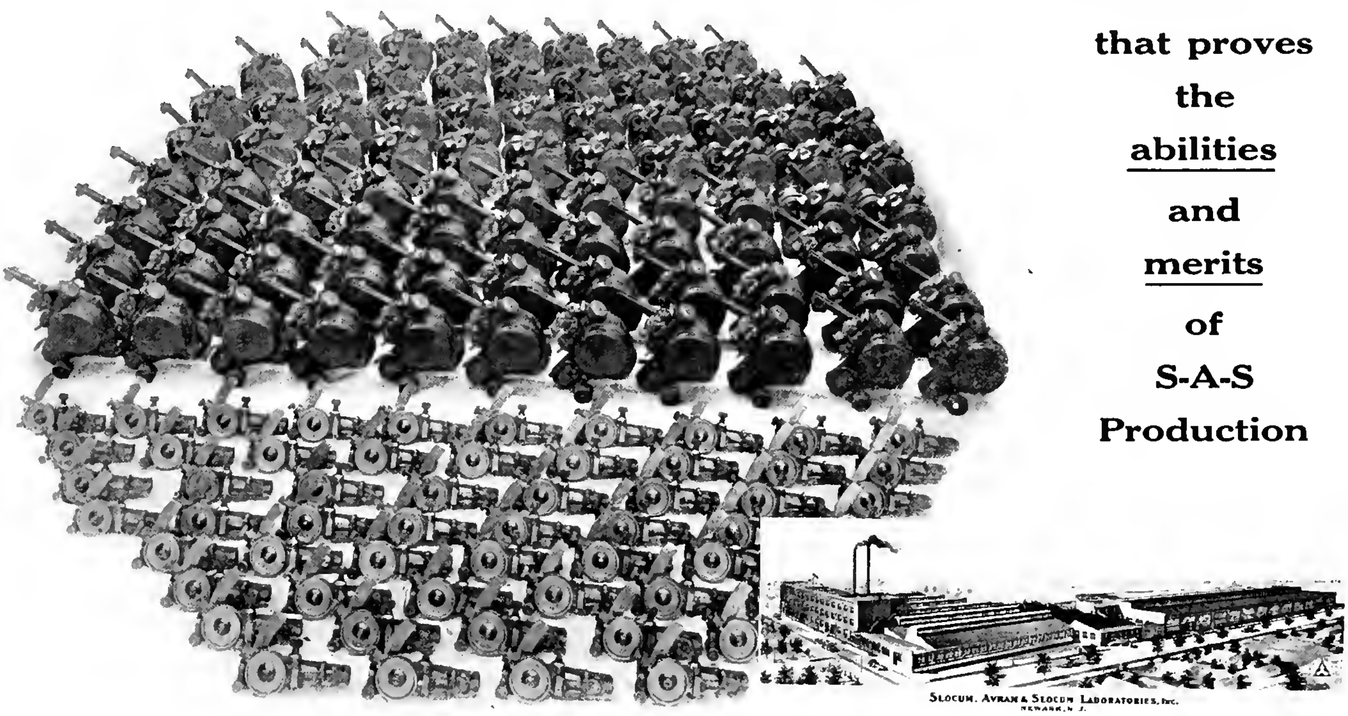
Factory Management in Garment Trades, Mack Gordon. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 230-235, 4 figs. Advising acceptance of democratic principle in training and follow-up functions.

Need of Personal Responsibility in Industry, Harry Tipper. Automotive Industries, vol. 41,

Production Work

As you want it — and when you want it

One Week's Work—



that proves the abilities and merits of S-A-S Production

The above illustration shows one week's production in the S-A-S Shops for the U. S. Government—83 Schneider sights and 60 4.7 range quadrants—an achievement in the quantity production field for accuracy and delivery.

This is only one of many examples of S-A-S performance that demonstrates S-A-S Leadership in the quantity production field. War-time necessity for accuracy and speed has developed our shops to a high point of efficiency and insures accurate, rapid and economical production for you now.

When you give the S-A-S Laboratories your Production Work

—you eliminate loss of profits through troublesome production
—you strengthen your abilities to meet competition
—you build an enviable reputation for quality

Superior workmanship—careful attention to details—a continuous record for satisfactory delivery and the development of S-A-S Service from year to year to keep S-A-S Production Leadership over all others has won the confidence of many leading organizations.

Let us be of service to you—let us solve your production difficulties and problems—write today.

This is the eighth of a series of advertisements telling about our plant, our methods and the work we are doing—another view of our production shops in the next issue.

SLOCUM, AVRAM & SLOCUM LABORATORIES, Inc.

Production Plant: NEWARK, N.J. *New York Office*: Woolworth Bldg., N.Y.

Special Machinery QUANTITY PRODUCTION Jigs, Fixtures and Gages

SLOCUM-AVRAM-SLOCUM MANAGEMENT

no. 11, Sept. 11, 1919, pp. 534-535. Points out that employer can do much to solve his labor troubles if he will educate his workers as to their part of whole and himself realizes responsibility to workers.

Getting Ready for the Shop Emergency. Can Machy., vol. 22, no. 5, July 31, 1919, pp. 118-121, 6 figs. States that every well appointed plant must have the means to deal quickly and efficiently with any mishap that may be encountered. How outfits are made up; accident prevention.

Maintenance of Management, Frank B. Gilbreth. Eng. & Indus. Management, vol. 2, no 10, Sept. 4, 1919, pp. 296-298, 1 fig. Proposed form for standing orders.

Sceintfic Management IV, Henry Atkinson. Eng. & Indus Management, vol 2, no. 10, Sept. 4, 1919, pp. 300-301 Points out that in order to establish successfully scientific management in any plant, "it is essential to take the broad view of industry and its relation to the general welfare," without any spirit of trying to "see if there is anything in it."

The Application of Industrial Efficiency, Charles E. Bedaux. Eng & Contracting, vol. 52, no. 11 Sept. 10, 1919, pp. 311-312. Its importance to meet European competition.

Engineering Organization and Routine, George L. McCain Automotive Industries, vol. 41, no. 12, Sept 18, 1919, pp 562-567, 9 figs Suggested system for keeping all concerned in touch with all of the work and developments at all times

Eliminating the Stop Watch from Industry, C. E. Knoeppel. Iron Age, vol. 104, no 12, Sept. 18, 1919, pp. 766-767. Production rates, determined by conferences with workers, and efficient management as essentials.

Production Records

Planning and Controlling Production, Ivan R. DeArmond Macy. (Lond.), vol. 26, no. 1, Sept. 26, 1919, pp. 617-619. Records used by R K LeBlond Machine Tool Co., by means of which information concerning progress of work, stock on hand or required, and location of job at any time may be quickly determined.

Purchasing

Organization for Purchasing and Stores, Henry B. Spencer. Ry. Age, vol. 67, no. 13, Sept. 26, 1919, pp. 617-619. Supervision by executive officer of purchasing, selling, storing, handling, protecting and disbursing.

Restaurants

Installing and Operating an Industrial Cafeteria, E F. Ross. Iron Trade Rev., vol. 65, no. 11, Sept 11, 1919, pp. 691-694, 6 figs. Information regarding equipment required, method of operating, system of financing and cost of Installing a modern lunch room for employees.

Shop Layout

Efficiency in Industrial Planning Illustrated in a New Forge Shop Am. Architect, vol. 116, no. 2279, Aug. 27, 1919, pp. 283-287, 6 figs. Illustrating general character of buildings in plant of Central Forge Co., Detroit, Mich., and open space provided on all sides by use of rolling doors, also diagrams showing arrangment of equipment.

Shop Papers

The Shop Paper as an Aid to Morale, Peter F. O'Shea. Factory, vol. 23, no. 3, Sept. 1919, pp. 518-522, 10 figs Experience of writer as editor of factory house organ of Greenfield Tap and Die Corporation.

Make the House Organ a Human Interest Organ with a Punch, Robert E. Park. Automotive Industries, vol. 41, no. 12, Sept. 18, 1919 pp 572-574. Survey of editorial policies followed by various plant journals.

Tool Repairs

Getting Quick Action on Small Tool Repairs, T. F. W. Meyer Factory, vol. 23, no. 3, Sept. 1919, pp. 504-506, 2 figs. Method where tag itself is work order.

Woodworking Industry

See Production Methods.

INSPECTION

Bureau of Standards, Optical Apparatus

Optical Projection Applied to Inspection, H. C Bean Inspector, vol. 1, no. 4, Sept 15, 1919, pp 25-30, 7 figs. Description of apparatus developed and used by Bur of Standards.

LABOR

Bonus System

Bonus System for Boiler Room Employees, Robert June. Power House, vol. 12, no 13, Aug. 20, 1919, pp. 356-357, 2 figs. Its effect upon economy in operation. From answers received by writer to circular letter he sent to various chief engineers of power plants in Canada.

Bonus Systems for Chemical Works, Norman Swindin. Chem. Age, vol. 1, no. 9, Aug. 16, 1919, pp. 240-243, 4 figs. Account of research carried on in large chemical works in regard to application of Rowan system.

Employment System

Placing the Right Man in the Right Job—I, W. D. Stearns, Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp 30-33. Outline of methods used by Westinghouse Elec. & Mfg. Co., East Pittsburgh.

Health of Man

How to Keep the Human Machine in Working Order, Thomas Darlington. Eng. & Contracting, vol. 52, no. 12, Sept 17, 1919, pp. 331-332. Noting relation of efficiencies to health.

Labor Unrest

Effect of Labor Unrest on Output and Cost. Eng. & Indus. Management, vol. 2, no. 8, Aug. 21, 1919, p. 250. Report submitted by German Industry and Trade Conference to Nat. Assn., outlining result of inquiry as to direct and indirect effects of revolution on conditions of labor and consequently on production and exchange of goods.

One-Man-One-Job System

Fallacy of the One-Man-One-Job System in Industy, Harry Tipper. Automotive Industries, vol 41, no. 12, Sept. 18, 1919, pp. 580-581. Monotony of system argued as drawback against its effectiveness

Profit Sharing

Profit-Sharing and Ownership Fred Mills. Eng & Indus. Management, vol. 2, no 8, Aug. 21, 1919, pp. 237-239 Memorandum n labor unrest laid by writer before British Coal Commission.

Shop Committees

Labor and the Shop Committee, William Leavitt Stoddard, Indus Management, vol. 58, no. 3, Sept. 1919, pp. 217-220. Organized labor's position.

Recognizing the Human Side of Industry, A B. Kennedy. Can. Machy., vol. 22, no. 5, July 31, 1919, pp. 92-96, 6 figs. Industrial council and cafeteria among features adopted.

Steel Industry

The Iron and Steel Situation. Manufacturers Rec., vol. 76, no. 11, Sept. 11, 1919, pp. 107-108. Labor question as it affects iron and steel situation.

Wage Systems

The Piece Work Pay System, J A. A. Beaudin. Gas Rec., vol. 16, no. 4, Aug. 27, 1919, pp 37-38. How it works in Montreal Light, Heat & Power Co as applied to meter readers, billers, delivery men and collectors. Paper read before Can. Gas Assn.

Welfare

Industrial Welfare, Edgar L. Collis. Eng. & Ind. Management, vol. 2, nos. 8 and 9, Aug. 21 and 28, 1919, pp. 246-249 and 266-268, 1 fig. Aug. 21: Welfare in relation to industrial birth, life and death. Aug. 28: Deals with organization of welfare, and refers particularly to a scheme of welfare supervision for boys.

Women

Women's Work in Engineering and Shipbuilding During the War, Lady Parsons. Trans. North-East Coast Instn. Engrs. & Shipbuilders, vol. 35, no 6, Aug. 1919, pp. 227-234. Summary of technical work of skilled nature.

Report on the Metabolism of Female Munition Workers, M. Greenwood, C. Hodson and A. E. Tebb. Proc. Roy. Soc., vol. 91, no. B635, Aug. 6, 1919, pp. 62-82. Following conclusions are arrived at from experimental tests and measurements: For light training and forging about 100 cal. per sq. m. of body surface per hr. are needed; for tool setting, heavy turning, stamping, finishing copper bands and shell hoisting, about 125 cal. per sq. m. per hr.; for gaging, walking and carrying, about 160 cal. per sq m. per hr.; and for laboring, cleaning and drying, about 180 cal. per sq. m. per hr.

A Preliminary Study of the Energy Expenditure and Food Requirements of Women Workers, O. Rosenheim. Proc. Roy Soc., vol 91, no B635, Aug. 6, 1919, pp. 44-61, 1 fig. As results of experiments in which it was intended to measure actual energy expenditure of average woman worker during 24 hr., it is quoted that an average of 2400-2800 cal. may be assumed as a standard for women the corresponding figure for men being 3000-3500 cal.

LEGAL

Infection Liability

The Liability of Infections, Chesla C Sherlock. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 252-253. Court interpretations of problems brought by workmen's compensation acts.

Resale Price Fixing

The Fixing of Resale Prices—I, Chesla C. Sherlock. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 521-522. Legal aspect of question.

LIGHTING

Daylight Measurements

Some Practical Daylight Measurements in Modern Factory Buildings, Emile G. Perrot and Frank C. Vogan. Tran. Illum. Eng. Soc., vol. 14, no. 6, Aug. 30, 1919, pp. 257-277, 10 figs. Photometric readings taken in several buildings.

Industrial Lighting

What Better Industrial Lighting Can Do to Stimulate Production, F. H. Bernhard Elec. Rev., vol. 75, no. 10, Sept. 6, 1919, pp. 381-384, 2 figs. Based on records of increased production due to efficient lighting at time of war.

The Science of Efficient Shop Illumination, A. W. Swan. Can. Machy., vol. 22, no 5, July 31, 1919, p 97, 1 fig. Subject of shop lighting considered as a very vital one, for without proper illumination workmen cannot be expected to produce results either from quality or quantity standpoint.

How Better Industrial Lighting Can Improve Working Conditions, F. H. Bernhard. Elec. Rev., vol. 75, no. 12, Sept. 20, 1919, pp. 469-472, 3 figs. Because, it is said, it adds to welfare of employees and reduces labor turnover and labor disputes.

Shipyards

Shipyard Lighting, H. A. Horner. Tran. Illum. Eng. Soc., vol. 14, no. 6, Aug. 30, 1919, pp. 278-282 and discussion pp. 282-285. Notes deficiency in present methods and suggests improvement.

Shops

See Industrial Lighting.

Windows

What It Pays to Know About Factory Lighting—VII, C. E. Clewell. Factory, vol. 23, no. 3, Sept. 1919, pp. 496-499, 5 figs. Concerning location of windows and selection of sash and glazing.

RECONSTRUCTION

Alsace

Textile Industries of Alsace (Les industries textiles de l'Alsace), Alfred Renouard, Bulletin de la Société d'Encouragement pour l'Industrie Nationale, vol. 131, no. 4, July and Aug. 1919, pp. 32-63. History of their development and remarks on their present economic significance.

France

Present Position and the Future of French Industry (La situation et l'avenir de l'industrie française), Ch. Vallet, Industrie electrique, vol. 28, no. 652, Aug. 25, 1919, pp. 301-302. Economical situation in coal industry. (Concluded.)

Germany

Germany's Industrial Position, Richard D. Zucker. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 777-780. From before the war to the present time. Compiled from writer's personal observations.

War-Time Activities of Dye Plants in Germany. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 224-225. From report of British mission appointed to visit enemy chemical factories in occupied zone, introduced at Dyestuffs Hearings before House Committee on Ways and Means.

The German Machine-Tool Industry During and After the War. Am. Mach., vol. 51, no. 11, Sept. 11, 1919, pp. 537-539. Writer sees "German national front of business" broken and believes in eventual internationalization of German industry.

Machine-Tool Trade

Conditions in the Machine Tool Trade, Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 75-76, 1 fig. Containing Government price fixing chart for determining selling price of standard machine tools.

Plant Conversion to Peace Work

Adapting Munitions Plant to Peace-Time Work. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 620-626, 9 figs. Particularly in reference to method employed of making distribution system more flexible.

Trans-Missouri Region

Industrial Development in the Trans-Missouri Region, P. F. Walker. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 821-823. Statistical figures relative to agricultural and mineral products, accomplishments in manufacturing and transportation and freight adjustments.

SAFETY ENGINEERING

Accident Statistics

Accident Statistics of German Reinforced-Concrete Construction for 1911 to 1918 (Unfallstatistik des Deutschen Ausschusses für Eisenbeton 1911 bis 1918), W. Petry. Beton u. Eisen, vol. 18, no. 7 and 8, May 5, 1919, pp. 73-76. Compiled by German Committee on Reinforced-Concrete Construction, appointed by Secretary of Public Works.

Boiler Explosion

The Boiler Explosion at Mobile, Ala. Locomotive. Hartford Steam Boiler Inspection & Insurance Co., vol. 32, No. 6, April 1919, pp. 162-165, 2 figs. Suggested explanation for explosion of two water-tube boilers, one Heine and one Stirling.

Dust Explosions

Dust and Dust Explosions (Straub und Straubexplosionen). Rauch u. Straub, vol. 9, no. 7, Apr. 1919, pp. 53-54. Considers ventilation and sprinkler system used in German mines since 1898 to be the best means to prevent explosions.

Cause and Prevention of Dust Explosions. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 858-859. Recommendations made by Ontario Fire Prevention League.

Fires, Mine

Mine Fires, and the Inert Gas Method by Which They May be Extinguished, Joseph J. Walsh. Jl. Am. Soc. Heat. & Vent. Engrs., vol. 25, no. 3, July 1919, pp. 329-331, 1 fig. Arrangement consists of ordinary boiler furnace; gases produced by combustion are conducted through cooling tubes, immersed in water, and then forced into mine. Gases used are carbon dioxide and nitrogen.

Fire Protection

Fire Protection for Oil Tanks. Eng. & Min. Jl., vol. 108, no. 9, Aug. 30, 1919, pp. 350-351, 3 figs. Method for extinguishing fires by using bubbles containing carbonic-acid gas to form blanket covering on surface.

Fire Protection for Schools. H. W. Forster. Construction, vol. 9, no. 1, July 1919, pp. 11-21. Importance of providing for it and essential features to secure it. From Nat. Fire Protection Assn. Quarterly.

Water Departments and Private Fire Lines, Dow R. Gwinn. Can. Engr., vol. 37, no. 13, Sept. 25, 1919, pp. 335-337. Proper regulation governing private fire-protection lines; contamination of water supply suggestions for compensations.

Industrial Safety

Industrial Safety—H. C. W. Price. Power Plant Eng., vol. 23, no. 17, Sept. 1, 1919, pp. 784-785. Suggestions in regard to plant conditions, arrangement, order and lighting in and around industrial plants.

Steam Prime Movers

Methods of Guarding Engines and Turbines. Power House, vol. 12, no. 12, Aug. 5, 1919, pp. 330-333, 4 figs. Different forms of safety apparatus as applied to governor, flywheels and rotors.

SALVAGE

Goodrich Rubber Company

Salvage and Reclamation Department of The B. F. Goodrich Rubber Company, George W. Sherman. Indus. Management, vol. 58, no. 3, Sept. 1919, pp. 176-178, 4 figs. Deals particularly with organization features of department.

Liberty Engine Materials

Application of Liberty Engine Materials to the Automotive Industry, Harold F. Wood. Am. Mach., vol. 51, no. 12, Sept. 18, 1919, pp. 557-562. Author states reasons for use of certain materials and certain treatments for each part and gives recommendations for their application to problems of automotive industry.

TRANSPORTATION

Automobile Factory Transportation System

Automobile Factory Transportation Systems, Edward K. Hammond. Machy. (N. Y.), vol. 26, no. 1, Sept. 1919, pp. 1-7, 11 figs. Types of equipment used for transporting raw materials and parts of product through plant of Willys-Overland Co. in Toledo, Ohio.

Motor Trucks at Marine Freight Terminals

Motor Trucks and the Problem of Efficient Marine Freight Terminal Operation—II, III, Merrill C. Horine. Int. Marine Eng., vol. 24, nos. 9 and 10, Sept. and Oct. 1919, pp. 632-627 and 696-703, 15 figs. Sept.: Comparison of horse dray with motor carriers; also discussion of value of store-door delivery. Oct.: Emphasizes that weak link of our transportation facilities as applied to overseas commerce is not in railroads or ocean carriers, but in methods and facilities employed for handling freight at marine terminals.

Truck Routing

Routing Trucks by Capacity. Commercial Vehicle, vol. 21, no. 3, Sept. 1, 1919, pp. 99-101, 2 figs. Brooklyn soap manufacturer claims to obtain greatest truck efficiency by this method.

Trucks, Electric

Use of Industrial Electric Trucks and Tractors in Warehouses, Bernard J. Dillon. Elec. Rev., vol. 75, no. 9, Aug. 30, 1919, pp. 345-348, 5 figs. Application of such equipment to handling problems of warehouses and storage places of all types.

Trucks, Garaging

How the American Railway Express Co. Secures Greater Service from Its Motor Trucks. Eng. & Contracting, vol. 52, no. 12, Sept. 17, 1919, pp. 340-341. Features of garaging and maintaining 3313 motor vehicles.

VARIA

Chicago District

Industrial Resources of the Chicago District, H. B. Pulsifer, Procter Thomson and Ernest Edgar Thum. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 310-319, 7 figs. Metallurgically, Chicago is described as ranking second only to Pittsburgh as producing center, while in non ferrous operations refining and alloying are represented extensively. Statistics are quoted to show that in Lake County, Ind., and Cook County, Ill., value of stone, lime, sand and gravel, clay products, mineral paint, pigments, cement, coke and steel reached $300,000,000 market in 1917.

Indiana

Natural and Industrial Resources of Indiana, W. N. Logan and F. O. Anderegg. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 320-325, 5 figs. Noting specially research work being done in chemical plants.

Michigan

Natural and Industrial Resources of Michigan, R. A. Smith and W. L. Badger. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 326-334, 2 figs. Leading products include iron, copper, salt, alkalis, halogens, lime, gypsum, cement, abrasives, silica, sugar, paper, dyes and organic chemicals.

Wisconsin

Natural and Industrial Resources of Wisconsin, W. O. Hotchkiss, O. L. Kowalke and A. M. Plumb. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 335-341, 11 figs. Raw-material resources consist of zinc ores, iron ores, granite and mineral waters. Leather and paper industries among most important of state on bases of value of product and number of men employed.

World Trade

The Economics and World Markets. Raw Material, vol. 1, no. 6, Aug. 1919, pp. 282-289, 9 figs. Reviews status of producing centers of the world, traces shipping routes, outlines smelting conditions and indicates present tendencies of market.

Electrical Engineering

ELECTROCHEMISTRY

Polarization

The Polarisation of a Leclanché Cell, Felix E. Hackett and R. J. Feely. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 26, March 1918, pp. 279-288, 4 figs. Recovery of cell from polarization divided into two sections: initial stage of rapid recovery in which about 90 per cent of polarization disappears in about ten minutes; followed by slow return extending over several hours to initial value of e.m.f.

Potential of Aluminum

The Effect of Amalgamation upon the Single Potential of Aluminum, Louis Kahlenberg and John A. Montgomery. General Meeting of the Am. Electrochem. Soc., paper no. 7, Sept. 23-26, 1919, pp. 45-46, 5 figs. Measuring single potential of aluminum in 1/3 molar solution of aluminum chloride at room temperature, by means of calomel electrode, writers claimed to have obtained much higher values with amalgamated than with unamalgamated aluminum, due to removal of coat of resistant oxide by mercury.

ELECTRODEPOSITION

Gold and Silver

Electrodeposition of Gold and Silver from Cyanide Solutions, S. B. Christy. Dept. Interior, Bur. Mines, Bul. 150, 1919, 171 pp., 44 figs. Bases on writer's experiments made in laboratories of University of Cal., extending over period of 20 years. Results are expressed in diagrammatic form by curves showing relation between simultaneous variables.

Lead Plating

Lead Plating from Fluoborate Solutions, W. Blum, F. J. Liscomb, Zalia Jencks and W. E. Bailey. General Meeting of the Am. Electrochem. Soc., paper no. 11, Sept. 23-26, 1919, pp. 101-122, 12 figs., partly on six supp. plates. From experiments it is concluded that by increasing concentration of lead it is possible to use higher current densities than those ordinarily used without causing treeing of deposits. A range of conditions is recommended as guide for commercial work.

Platers' Solutions

Standardisation of Platers' Solutions in Individual Plants, Charles H. Proctor. Metal Industry, vol. 15, no. 7, Aug. 15, 1919, pp. 122-124. As means of increasing efficiency.

Structure of Electrodeposited Metals

Factors Governing the Structure of Electro-Deposited Metals, William Blum. General Meeting of the Am. Electrochem. Soc., paper no. 8, Sept. 23-26, 1919, pp. 57-76, 19 figs., partly on ten supp. plates. Experiments said to have shown that Bancroft's "axioms of electroplating" are applicable over wide range of conditions and with variety of metals. It is therefore suggested that they may serve as valuable guide in plating research and in practical plating operations.

ELECTROPHYSICS

Armature Reaction

Reactions of the Armature of an Alternator (Sur la réaction d'induit des alternateurs), E. Brylinski. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 174-177. As influenced by magnetic hysteresis.

The Solution of Circuit Problems. Mathematical Methods of Investigation Resulting from the Application of Fourier's Integral, Thorton C. Fry. Phys. Rev., vol. 14, no. 2, Aug. 1919, pp. 115-136, 6 figs. Expansion of fundamental integral for current in any network in circuit theory effected in Bessel's series and also by (1) using Heaviside-Carson expansion, and (2) using Taylor's series.

Notes on Electric and Magnetic Field Constants and Their Expression in Terms of Bessel Functions and Elliptic Integrals, A. Gray. Lond., Edinburgh, & Dublin Phil Mag., vol. 38, no. 224, Aug. 1919, pp. 201-214, 4 figs. Four cases—(1) Potential produced at any point in a thin disk of matter of uniform surface density; (2) potential produced and component magnetic field intensities at any point in a circular doublet-disk of uniform strength per unit area; (3) potential and field intensities of uniform right circular cylinder; and (4) potential and field intensity of right cylindrical array of equal doublet-disks.

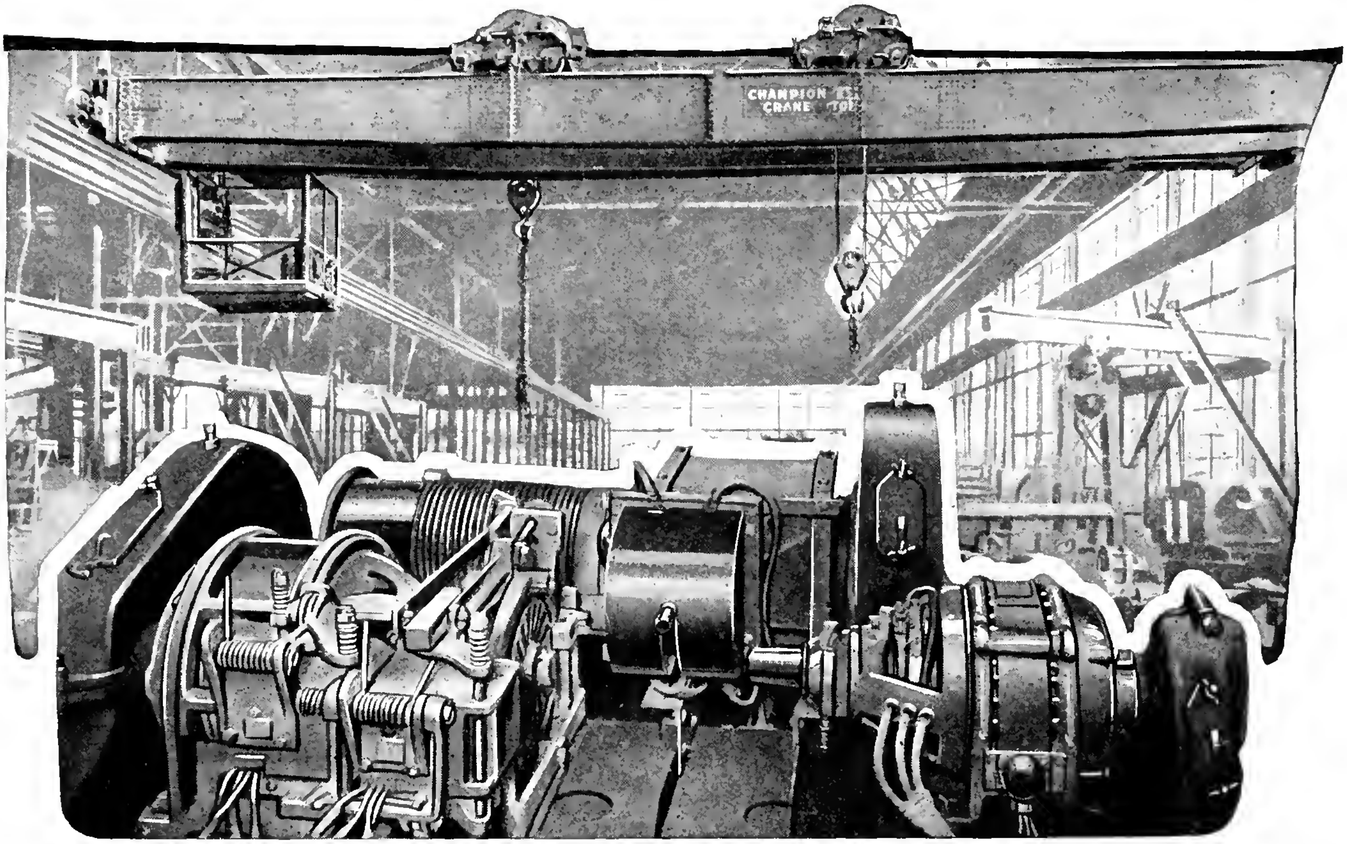
A Report on Electromagnetic Induction, S. J. Barnett. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1151-1169. Historical sketch of fundamental results obtained from days of Faraday to present time in studying electromotive forces ordinarily referred to domain of electromagnetic induction, together with treatment of unipolar induction in both open and closed circuits.

Additions to the Formulas for the Calculation of Mutual and Self Inductance, Frederick W. Grover. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 537-570. Supplementing collection of formulæ given in Scientific Paper No. 169.

Interference

Interference of Power Circuits with Telephone Circuits, E. Parry. New Zealand Jl. Sci. & Technology, vol. 11, no. 4-5, July 1919, pp. 308-314, 4 figs. Attempt to coördinate result of experience for calculating beforehand

The wonderful achievements of America's shipbuilding industry were greatly facilitated by electric power equipment.



Lower at Constant Speed and Without Friction

AN alternating current motor-driven hoist can be made to lower many varieties of loads at any desired speed—if equipped with a solenoid load brake. Friction wear is eliminated, except at creeping speeds or when stopping.

Loads of from 0 to 125% load are lowered at less than 50% speed. Heavy loads are lowered with regenerative braking at not over 150% normal speed, and power returned to source of supply.

Light hook can be lowered at normal speed.

Motor can be jogged 1/20 of a revolution of the armature, which is impossible with any other type of AC or DC Control.

Send for full information given in Reprint X386, Second Edition, entitled "Speed Control of Induction Motors on Cranes and Hoists by Means of Solenoid Load Brakes and Multiple Magnet Brakes."

General Electric Company

General Office Schenectady, N.Y.

Effects resulting from any given relative disposition of circuits and from any given method of work.

Leakage

Studies on Doubly Interlinked Leakage (Beitrag zur doppeltverketteten Streuung), F. Punga. Archy f. Elektrotechnik, vol 7, no. 11 12, May 5, 1919, pp. 337-379, 53 figs. Vectorial derivation of differential leakage for any desired number of grooves and any desired position of rotor. Cases where zig-zag leakage and double interlinked leakage are synonymous, as in motors with squirrel-cage rotor and motors with an uneven number of grooves in the stator and rotor and in those with slip-ring rotor.

Magnetic Field, Molecular

The Molecular Magnetic Field (El campo magnético molecular), Richard Gans. Contribucion al estudio de las ciencias fisicas y matematicas, Universidad Nacional de la Plata, vol. 11, no. 36, July 1918, pp. 209-222, 2 figs. Technical derivation of following theorem: At absolute zero all directions of molecular magnetic field may be considered, with respect to determination of magnetism curve, as equally probable.

Reactance Coils

Some New Formulas for Reactance Coils, H. B. Dwight. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 9, Sept. 1919, pp. 1039-1060, 7 figs. Formulæ are derived for mutual inductance of coils with parallel axes, repulsion of coils with parallel axes and self-inductance of long cylindrical coils.

Thermoelectricity

Thermoelectric Power and Resistance of Bismuth in a Magnetic Field (Potere thermoelettrico e resistenza del bismuto nel campo magnetico), M. La Rosa. Il Nuovo Cimento, vol. 18, no. 7, July 1919, pp. 26-38, 1 fig. Experimental. Effect of producing Peltier, Thomson, and Hall phenomena in magnetic field.

Vacuum Tube

The Vacuum Tube as a Generator of Alternating Current Power, John H. Morecroft and H. Trap Friis. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1193-1221, 35 figs. Deals with operation of tube when separately excited and efficiency of tube as generator. Analysis of forms and phases of voltages and currents in different parts of circuit as well as oscillograms showing action of tube under various conditions are given.

FURNACES

Design

The Design of Electric Furnaces, R. C. Gosrow. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 235-241. Consideration of the elements of size and other details in relation to operation and recovery of metal, with special reference to production of ferromanganese.

GENERATING STATIONS

Cost of Electric Supply

The Cost of Electric Supply, William Woodhouse. Elec. Times, vol. 56, no. 1454, Aug. 28, 1919, pp. 159-160, 1 fig. Relationship between cost, load factor and demand.

High-Tension Service

Delivery of High-Tension Service to Large Consumers, Rawson Collier. Elec. Rev., vol. 75, no. 10, Sept 6, 1919, pp. 392-396, 3 figs. General considerations involved: relation of cost to station capacity and revenue; choice of equipment; metering.

Gatun Hydroelectric Station

Development of Gatun Hydroelectric Station. Jl. Electricity, vol. 43, no. 5, Sept 1, 1919, pp. 198-201, 5 figs. Details of recent improvements in power plant which furnishes power for operation of canal.

Rectification

Advantages and Disadvantages of the Various Systems of Rectifying High-Tension Alternating Current (Advantages et inconvénients des divers systèms de transformation de courant alternatif à haute tension en courant continu), F. Sarrat. Association des Ingéieurs Electriciens Sortis de l'Instiut Electrotechnique Montefiore, vol. 1, nos. 3, 4, 5, 6, 7, March, April, May, June, July, 1919, pp. 161-236, 29 figs. Figures compiled from various power stations in reference to efficiency, cost, maintenance expense, power factor, etc., of various systems, for presentation to Congrès International de Tramways et de Chemin de fer d'intértêt local, which was to be held at Budapest in Sept. 1914.

Unit Analysis

Unit Analyses of Industrial Power Business. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 627-629. Records of Massachusetts central stations quoted as proof that desirable revenue is consistent with moderate average yield per kw hr.

GENERATORS AND MOTORS

Balancing Rotors

Balancing and Alignment of the Alternator Rotor, C. Sylvester. Elec. Rev., vol. 85, no. 2179, Aug. 29, 1919, pp. 260-261, 3 figs. Illustrating method for adjusting balance weights on turbo-alternator rotor.

Control Gear for D.C. Motors

Control Gear for Direct Current Motors, C. W. Stubbings. Electricity, vol. 31, no. 1504, Sept. 5, 1919, pp. 553-554. Recently constructed switch of the liquid type was so arranged that closing short-circuiting switch for starting resistance automatically opened valve which caused tank immediately to empty.

Dynamo, D.C.

Direct Current Dynamo for Constant Current at variable speed (Gelijkstroomdynamo voor constanten stroom bij veranderlijk aantal omwentelingen), J. Botermans. Ingenieur, vol. 34, no. 33, Aug. 16, 1919, pp. 603-605, 2 figs. This dynamo differs from other constructions in that its field is influenced by currents which circulate in a number of short circuited bars.

See also Motors, D.C., Large.

Motors, D.C., Large

The Operation of Large Direct-Current Motors Without Starting Resistances, W. Linke. Elecn., vol. 83, no. 2152, Aug. 28, 1919, pp. 170-171. Account of Trettin's conclusions arrived at from mathematical investigations and of tests performed by writer. From Elektrotechnische Zeitschrift.

See also Control Gear.

IGNITION APPARATUS

Spark-plug Terminals

Deterioration of Nickel Spark-Plug Terminals in Service, Henry S. Rawdon and A. I. Krynitzky. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1323-1350, 21 figs. Investigation at Bureau of Standards represented as having shown that service deterioration of nickel spark-plug terminals is due to embrittlement of wire by formation of system of intercrystalline network and definite transverse cracks.

Two-Spark Ignition

A Two-Spark Generator Battery Type Ignition. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 511-512, 7 figs. Equipment consists of double ignition distributor, two ignition coils and combination lighting and ignition switch.

LIGHTING AND LAMP MANUFACTURE

Arc, Luminous Vapors in

Luminous Vapors Produced in the Arc, with Applications to the Study of Spectral Series and Their Origin (Vapeurs lumineuses distillées de l'arc, avec applications à l'étude des séries spectrales et leur origine), R. J. Strutt. Radium, vol. 11, no. 7, May 1919, pp. 200-204, 4 figs. Brilliant effects similar to those obtained with mercury arc are reported to have been produced with other metals.

Photometry

On the Photometric Measurement of Searchlights (Ueber das Photometrieren von Scheinwerfern), Gehlhoff. Zeitschrift f. Beleuchtungswesen, Heizungs- und Lüftungstechnik, vol. 25, no. 7 8, Apr. 1919, pp. 35-41, 12 figs. Claims that in order to eliminate absorption it is necessary to photometer two sufficiently different distances.

Searchlights

Metal Mirrors for Searchlights, R. B. Hussey. Gen. Elec. Rev., vol. 22, no. 9, Sept. 1919, pp. 652-655, 6 figs. Processes used in production of 60-in. mirrors. (The issue is devoted mainly to the subject of searchlights.)

Standardized Industrial Lighting Systems

Standardized Industrial Lighting Systems.—II, H. L. Cornelison. Elec. World, vol. 74, no. 9, Aug. 30, 1919, pp. 459-461, 5 figs. Engineering plans of Austin Co., Chicago, for conduit, wiring, panel and fixture arrangements for providing layouts in standard buildings.

MEASUREMENTS AND TESTS

Conductivity Constant

Simple Method for Ascertaining the Conductivity Constant in Alternating-Current Measurements (Einfache Verfahren zur Ermittlung der Leitungskonstanten aus Wechselstrommessungen), H. Jordan. Telegraphen- u. Fernsprech-Technik, vol. 8, no. 2, May 1919, pp. 17-22, 5 figs. Approximating formulæ for low and high values of Bl.

Electrometer

A Sensitive Modification of the Quadrant Electrometer: Its Theory and Use, A. H. Compton and K. T. Compton. Phys. Rev., vol. 14, no. 2, Aug. 1919, pp. 85-98, 3 figs. Introduction of tilted needle and movable quadrants in design. Advantages claimed are high sensitivity independent of deflection and quick adjustment of sensitivity through great range. It is claimed that by using a small needle 4.5 mm. in radius with a slight tilt, sensitivity as high as 60,000 mm. per volt were obtained.

Electroscope, Gold-leaf

A Method of Measuring the Capacity of Gold-leaf Electroscopes, A. T. Mukerjee. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 224, Aug. 1919, pp. 245-256, 1 fig. Using standardized or (Gerdien) sliding condenser, absolute capacity of quadrant system, including specially designed connector, is first determined by method of mixtures; gold-leaf system is then charged to known voltage, adjusted so that when charge is shared with quadrant system final potential is not far from one volt; as capacity of quadrant system can be varied by sliding condenser, capacity of electroscope can be measured at different voltages.

Galvanometers

Needle Galvanometers with Recording Mechanism (Galvanomètres inscripteurs à fer mobile), Henri Abraham and Eugène Bloch. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 171-174. Built for military radiotelegraphy and geographic service of French army.

Meters, Current

Sensitive Alternating Current Meters (Appareils sensibles pour les mesures en courants alternatifs), H. Abraham, E. Bloch and L. Bloch. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 2, July 15, 1919, pp. 59-62. Amplifying direct-reading voltmeter.

Potentiometer, High-Frequency Measurements

Alternating-Current Planevector Potentiometer Measurements at Telephonic Frequencies, A. E. Kennelly and Edy Velander. Proc. Am. Philosophical Soc., vol. 58, no. 2, 1919, pp. 97-132, 16 figs. Principle of potentiometer is the same as that described by Prof. Larsen in 1910, (Elek. Zeitschrift, Oct. 13, 1910, vol. 31, pp. 1039-1041; also The Electrical World, vol. 56, Nov. 3, 1910, pp. 1085-1088.) Present form was worked out in Mass. Inst. Technology Laboratories through thesis studies of A. E. Hanson in "The Design and Construction of an Alternating-Current Potentiometer," Sept. 1918.

Voltmeter, Synchronizing

An Improved Voltmeter for Synchronising Purposes, G. Keinath. Elecn., vol. 83, no. 2153, Aug. 22, 1919, p. 198, 1 fig. Employing resistance, having high temperature coefficient in series with voltmeter. From Elektrotechnische Zeitschrift, No. 46, 1918.

MATERIALS OF CONSTRUCTION

Contact Material

Contacts and Contact Material, H. von Fleischbein. Elecn., vol. 83, no. 2154, Aug. 29, 1919, pp. 220-221, 3 figs. Results obtained with tungsten contacts on relays. Translated from Elektrotechnische Zeitschrift.

Fiber

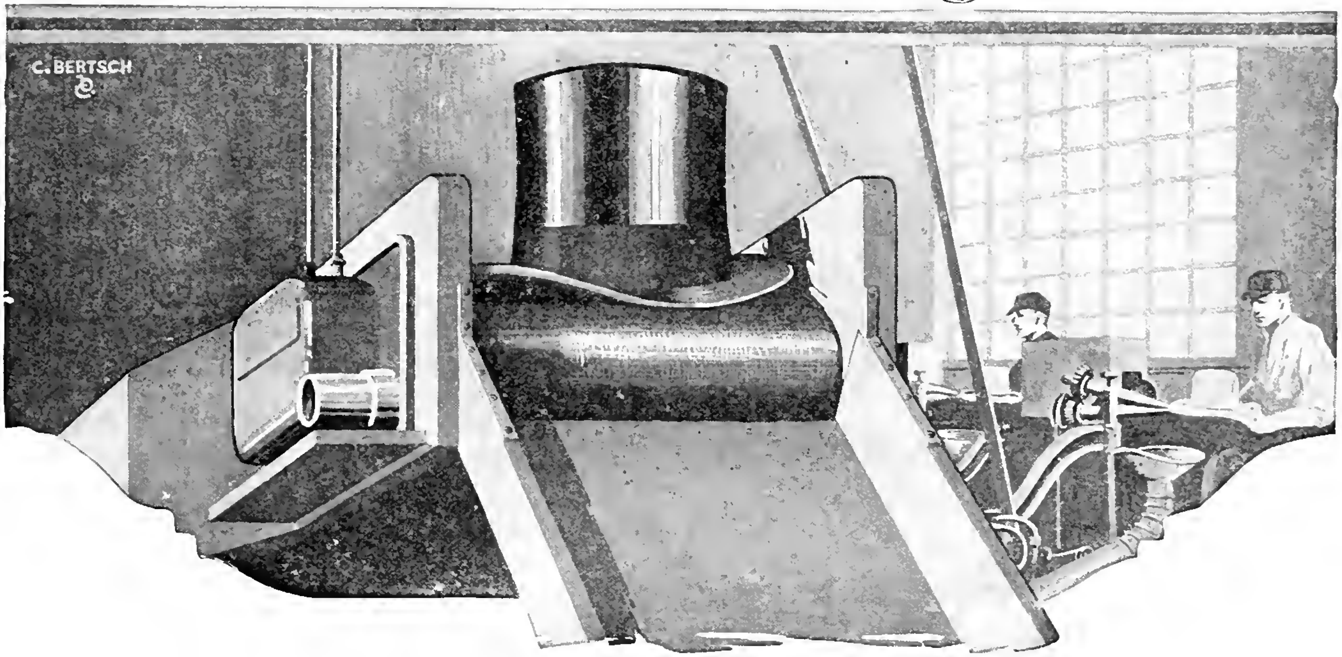
The Absorption of Water by Vulcanized Fiber and Erinoid on Exposure to Moist Air, and the Consequent Change of Electrical Resistance, R. G. Allen. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 32, Oct. 1918, pp 405-414. Vulcanized fiber found to be much more hygroscopic than erinoid. After being thoroughly dried and then exposed to moist air, electrical resistance of both, specially fiber, observed to decrease rapidly as time of exposure continued.

Insulators

The Porosity of Porcelain, with Special Reference to High-Pressure Insulators for Electric Transmission Lines, C. C. Farr. New Zealand Jl. Sci. & Technology, vol. 11, nos. 4 & 5, July 1919, pp. 302-307, 1 fig. Experiment claimed to have shown that density and porosity have little or no connection with each other.

Cracking or Pin Type Corner Porcelain Insulators, S. L. Foster. Jl. Electricity, vol. 43, no. 5, Sept. 1, 1919, pp. 213-215. How problem was solved by painting with shellack by United Railroads of San Francisco.

Lamson Conveyors



Stetson Hats Go through Factory on a Lamson Conveying System

The hat factories of the John B. Stetson Company are among the largest and most complete in the world, and they are equipped with a Lamson System of Mechanical Messengers and Conveyors.

Throughout four six-story buildings the Mechanical Messengers carry orders, memoranda, and other papers, the Conveyors and Chutes carry materials, unfinished and finished hats, and packing cases and boxes.

This Lamson installation saves its cost every year. It is in constant operation during working hours, handling many tons of material. It does work formerly done by hand and does it far better. It occupies no valuable floor space, running overhead out of the way.

Practically every factory can make profitable use of Lamson Conveyors. They are as varied as industry itself—Lamson Systems carry automobile bodies in one plant, olive bottles in another, flour in a third. They don't get tired or quit; they don't make mistakes; they save space—and the space saving alone is sometimes enough to pay for the conveyors. They reserve human labor for work that requires mind rather than mere muscle. They place the thing wanted where it is wanted, just when it is wanted.

The Lamson-equipped factory can operate at full speed all the time with no congestion in the packing and shipping departments. Plants using Lamson Systems have learned a new meaning of the word "capacity."

The Lamson Book on Conveying shows what Lamson Systems do, how they simplify production and packing, how they save. A copy will be sent on request, or our representative will call and discuss your problem with you.

The Lamson Company

LAMSON SERVICE

The Electrical Resistance of Porcelain at Different Temperatures. R. G. Allen. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 27, June 1918, pp. 289-309, 6 figs. Tests of several samples in various forms at different temperatures ranging from 80 to 300 deg. cent. Relation of Rasch and Hinrichsen between insulation resistance and absolute temperature found to remain approximately true.

The Insulating Properties of Erinoid. R. G. Allen. Scientific Proc. Roy. Dublin Soc., vol. 15, no. 29, Aug. 1918, pp. 331-358, 6 figs. Experimental. Erinoid found to be good insulator of fairly constant insulation resistance. Of various varieties of erinoid, red was found to be most absorbent of water and generally of lowest resistance.

See also Fiber.

Porcelain

See Insulators.

POWER APPLICATIONS

Heating

Industrial Applications of Electric Heating (Les applications du chauffage électrique dans l'industrie). F. Rutgers. Génie Civil, vol. 75, no. 9, Aug. 30, 1919, pp. 189-194, 18 figs. Illustrating electrically heated boilers, air-heating apparatus, electric radiators and electric furnaces.

Lighters

An Electrically Equipped Lighter, William H. Easton. Pac. Mar. Rev., vol. 16, no. 9, Sept. 1919, pp. 130-131, 6 figs. Penn. R.R. lighter equipped with electrically operated winches.

Motor Selection

The Use of Electrical Power in Industrial Works, G. W. Stubbings. Eng. & Indus. Management, vol. 2, no. 9, Aug. 28, 1919, pp. 264-265, 2 figs. Writer suggests types of electrical motors suitable for different classes of work.

STANDARDS

French Rules, Electric Material

French Rules for Standardizing Electric Material (Règles françaises d'unification du matériel électrique). Electricien, vol. 49, no. 1235, Aug. 31, 1919, pp. 73-75. Regulations for rating and classifying electric machines adopted by Commission Permanente de Standardisation.

STORAGE BATTERIES

Theory of Lead Storage Battery (Sur la théorie de l'accumulateur au plomb). Paul Bary. Revue générale de l'Electricité, vol. 6, no. 7, Aug. 16, 1919, pp. 195-199. Taking into account electrolysis of lead sulphate dissolved in electrolyte.

TELEGRAPHY AND TELEPHONY

Amplifiers

Recording Amplifiers Used in Wireless Telegraphy (Application des amplificateurs à l'inscription mécanique des signaux de télégraphie sans fil). Henri Abraham and Eugène Bloch. Comptes rendus séances de l'Académie des Sciences, vol. 169, no. 6, Aug. 11, 1919, pp. 282-285. Essays and field work of French Military radiotelegraphy quoted as evidence that lamp amplifiers permit direct reception of signals without any mechanical relays being used.

Antennæ

See Interference Elimination.

The Natural Constants of Wireless Antennæ. A. Meissner. Wireless Age, vol. 7, no. 78, Sept. 1919, pp. 320-323, 6 figs. Empirical formulæ for determining natural wave-length of various form of aerials. Translated from Physikalische Zeitschrift, March 15, 1919.

Artom Receiver

Artom's Visual Receiver for Directive Wireless Telegraphy. Wireless Age, vol. 6, no. 11, Aug. 1919, pp. 21-22, 3 figs. Built in form of d'Arsonval galvanometer. Movable coil is traversed by rectified high-frequency currents fed by directive aerials.

Automatic Switchboards

The Operator versus the Automatic. H. C. Townsend. Telephone Engr., vol. 22, no. 3, Sept. 1919, pp. 98-100. Examples in which manual switchboard is said to cope better with traffic.

Automatic Telephony

Meter and Coin Devices for Automatic. Arthur Bessey Smith. Telephone Engr., vol. 22, no. 3, Sept. 1919, pp. 101-105, 9 figs. Illustrating method of operation. Paper read before Automatic Tel. Engrs'. Conference.

Conduits, Telephone

Conduit Construction in Telephone Cable Tunnels. Eng. World, vol. 15, no. 6, Sept. 15, 1919, pp. 33-35, 6 figs. Construction methods employed.

Direction Finding

Theory and Practical Attainments in the Design and Use of Radio Direction Finding Apparatus Using Closed Coil Antennas, A. S. Blatterman. Jl. Franklin Inst., vol. 188, no. 3, Sept. 1919, pp. 289-362, 69 figs. Summary of investigation carried out in U. S. Signal Corps Radio Laboratories.

Infra-Red Radiation, Radiotelegraphy

Radiotelegraphy by Infra-Red Radiations (Radiotélégraphie par rayonnement infrarouge). J. Herbert-Stevens and A. Larigaldie. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 3, July 21, 1919, pp. 136-137. Experiments said to have given satisfactory results of distance up to 12 miles. Transmitter was arc projector, luminous rays of which were observed through suitable screen; receiver was thermoelectric couple placed at focus of parabolic mirror.

Oscillations

Electrical Oscillations in Antennas and Inductance Coils, John M. Miller. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp. 677-696, 8 figs. Application of antenna to theory of circuits having uniformly distributed electrical characteristics such as cables, telephone lines, and transmission lines.

Thermophones or Hot-Wire Receivers. Elecn., vol. 83, no. 2155, Sept. 5, 1919, p. 242, 1 fig. Technical note on relationship between watts in wire and diameter of wire. Hot-wire receiver is not considered to be sufficiently developed to be ready to replace electromagnetic receiver for all branches of telephony, but it is said that it has already filled conditions which electromagnetic failed to do.

Telephone Repeaters

Telephonic Repeaters, A. B. Hart. Instn. Post Office Elec. Engrs., no. 75, Nov. 22, 1918, 46 pp., 10 figs. Review of conditions which have led to evolution of telephonic repeater as at present used in post-office service, together with data offered as being of assistance in constructing estimates for telephonic repeater equipments, and suggestions in regard to changes in design, construction and maintenance of telephone lines that writer believes must be introduced if full advantage is to be taken of telephonic repeaters.

Thermophones

See Receiving Sets.

Transatlantic Communication

Transatlantic Radio Communication, E. F. W. Alexanderson. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1077-1093, 15 figs. Account of operation of present transatlantic stations and description of radio transmitting system at New Brunswick, N. J., which comprises special means for generating, modulating and radiating continuous wave energy. Article contains also account of multiple-antenna system of radiation.

Transmission

Principles of Radio Transmission and Reception with Antenna and Coil Aerials, J. H. Dellinger. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 10, Oct. 1919, pp. 1095-1150, 17 figs. Mathematical study of coil aerial as direction finder, interference preventer, reducer of strays and submarine aerial. Experiments are quoted which verify conclusions reached and formulæ are presented for designing aerial for any radio station.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Air-Blast Transformers

Maintenance of Air-Blast Transformers. Elec. Ry. Jl., vol. 54, no. 9, Aug. 30, 1919, pp. 424-426, 4 figs. Practice of United Railways of St. Louis where 63 air-blast transformers are kept in continuous service, noting special cover designed to prevent fires.

Booster Transformers

Principles of Booster Transformers, C. M. Jansky. Elec. Rev., vol. 75, no. 9, Aug. 30, 1919, pp. 341-344, 8 figs. Formulæ for finding percentage of boosting and cooking of single phase and poly-phase transformers under different conditions.

Furnace Transformers

Transformers and Connections to Electric Furnaces, J. F. Peters. Elec. Jl., vol. 16, no. 9, Sept. 1919, pp. 397-399, 7 figs. Concerning requirements of leads for large furnaces requiring over 10,000 amperes, especially at 60 cycles.

Large Transformers

Large Power Transformers, A. G. Ellis and J. L. Thompson. Elecn., vol. 83, no. 2155, Sept. 5, 1919, pp. 253-255, 3 figs. Writers refer to progress toward increased size of modern stations, generating units and transformers, and tendencies to higher pressures. Limiting sizes of transformers as effected by handling and cooling are discussed, and prices per kilovolt-ampere in relation to output, voltage and cooling are presented. (To be continued.) From paper presented before Instn. Elec. Engrs.

TRANSMISSION, DISTRIBUTION, CONTROL

Centralization

Centralization of Electrical Energy (Etat actuel des principaux transports d'énergie électrique). Pierre Moutier. Electricien, vol. 49, no. 1235, Aug. 31, 1919, pp. 76-80, 1 fig. Recent progress and consideration of future developments.

Condensers

Synchronous Condensers in High-Tension System, J. W. Andree. Elec. World, vol. 74, no. 11, Sept. 13, 1919, pp. 564-567, 5 figs. 52,500 kva. of synchronous condenser capacity is used for extensive high-tension system of Southern California Co. Functions of condensers discussed. How equipment is operated for maximum economy.

Insulators

Locating Defective Transmission-Line Insulators, T. F. Johnson, Jr. Elec. World, vol. 74, no. 11, Sept. 13, 1919, pp. 568-572, 5 figs. Details of "Buzz-stick" method that can be used on live high-voltage lines to detect faulty insulators of suspension or pin type, together with construction and use of special tools required.

Interconnection

California 220,000-Volt—1100 Mile—1,500,000 Kw. Transmission Bus. R. W. Sorensen, H. H. Cox and G. E. Armstrong. Proc. Am. Inst. Elec. Engrs., vol. 38, no. 9, Sept. 1919, pp. 1027-1038, 5 figs. Jl. Electricity, vol. 43, no. 5, Sept. 1, 1919, pp. 202-205, 4 figs. Scheme for interconnection of all California power plants.

Layout, Transmission Line

Laying Out a Power Transmission Line, Charles R. Harte. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 561-564, 3 figs. Concerning selection of route, clearances and pole and tower spacing with regard to maintenance as well as construction costs.

Power-Factor Correction

Power-Factor Correction by Use of the Static Condenser, O. C. Roff. Elec. Rev., vol. 75, no. 11, Sept. 13 1919, pp. 423-427, 8 figs. Characteristics of static condenser installations. Causes of low power factor. Operating costs and purchase price. Paper read before Penn. Elec. Assn.

Substations

Railway Converter Substations—III. C. F. Lloyd. Power House, vol. 12, no. 12, Aug. 5, 1919, pp. 334-337, 4 figs. Information concerning class of equipment to be used and its arrangement in substation building.

The Substations of Electro-Chemical Industries (in Japanese), S. Fukuda. Denki Gakkwai Zasshi, no. 373, Aug. 10, 1919.

The Nisqually Substation at Tacoma, Washington. Jl. Electricity, vol. 43, no. 6, Sept. 15, 1919, pp. 257-258, 3 figs. Description of equipment and operation.

Switches

Automatic Isolation of Faults on High-Tension A. C. System. Iron & Coal Trades Rev., vol. 99, no. 2687, Aug. 29, 1919, pp. 266-267, 10 figs. Particulars of various types of protection gear for tripping switches automatically.

Transmission Circuits

Electrical Characteristics of Transmission Circuits—III, Wm. Nesbit. Elec. Jl., vol. 16, no. 9, Sept. 1919, pp. 385-396, 11 figs. Tables for determining approximate size of conductor corresponding to given I_2R transmission loss for any ordinary voltage or distance.

WIRING

Mine Wiring

Modern Mine-Wiring Practice, Terrell Croft. Coal Age, vol. 16, no. 12, Sept. 18, 1919, pp. 480-485, 21 figs. Particulars of methods and appliances employed at various plants.

Civil Engineering

BRIDGES

Arch Testing

Description of a Machine to Test the Actual Horizontal Thrust of Model Arches, Edward Waller Stoney. Indian Eng., vol. 66, no. 3, July 19, 1919, pp. 38-39, 2 figs. Machine constructed to scale of one twelfth for 10 ft. span, bricks being made of teakwood, two forms, plain and grooved, being used.

Approach Fill

Concrete Ties Hold Together Walls of Bridge-Approach Fill. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 522-523, 2 figs. Showing details of reinforced-concrete tie rods between retaining walls of bridge-approach fill.

Construction

New Railroad Bridge at Schwanden, Switzerland (Neue Linthbrucke der S. B. B. in Schwanden). Schweizerische Bauzeitung, vol. 74, no. 7, Aug. 16, 1919, pp. 80-84, 14 figs. Air temperature curves; details of construction.

Design

Economic Span Lengths for Simple-truss Bridges, J. A. L. Waddel. Ry. Age, vol. 67, no. 13, Sept. 26, 1919, pp. 635-636. Showing fallacy of old criterion of equal superstructure and substructure costs.

Floors

Highway Bridge Floor Replaced after Corrosion. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 562-564, 2 figs. Noting special details adopted to protect new steel-concrete covering for tops of transverse floor beams, complete encasement of steel at abutments and over piers.

Hydraulic Resistance of Bridge

A Problem on the Hydraulic Resistance of a Bridge over the Chemung River at Elmira, N. Y., S. C. George, and E. W. Rettger. Cornell Civil Engr., vol. 27, no. 4, May 1919, pp. 119-126, 1 fig. Maximum flow in river near Lake Street bridge was found to be about 118,000 cu. ft. per sec.; special reference is made to Collingwood report on flood of 1889.

Rebuilding

Method of Rebuilding the Genesee River Bridge, Lehigh Valley R.R., Eng. & Contracting, vol. 52, no. 9, Aug. 27, 1919, pp. 249-251, 4 figs. Bridge originally built for 126-ton heavy-grade engine was brought up to capacity of Cooper's E 60 loading, which is present standard used on Lehigh Valley R.R. main-line bridges.

Reconstruction and Reinforcement of Iron Bridges of the Gotthard Railroad between Erstfeld and Bellinzona (Ueber den Umbau und die Verstäkung der eisernen Brücken auf der Bergstrecke Erstfeld-Bellinzona der Gotthardlinie), A. Buhler. Schweizerische Bauzeitung, vol. 74, no. 6, Aug. 9, 1919, pp. 61-66, 11 figs. Reconstruction necessary to enable bridges to carry load of new electric locomotives. (To be continued.)

Swing Bridge

Temporary Swing Bridge Over the Suez Canal. Engineer, vol. 128, no. 3321, Aug. 22, 1919, pp. 174-176, 3 figs. There are six separate spans, all of different length, total length of structure being 537 ft.; four of the spans are fixed and two are capable of being swung. Translated from Génie Civil.

BUILDING AND CONSTRUCTION

Air Pressure

Design of Structures Subjected to Passive Earth Presssue (Etude de quelques Constructions sollicitées par la Pression passive des Terres), Keiichi Hayashi. Memoirs of the Coll. of Eng., Kyushu Imp. University, Fukuoka, Japan, vol. 1, no. 5, 1919, pp. 333-394, 41 figs. By passive thrust is understood resistance offered by bank of earth to lateral displacement of wall subjected to external horizontal forces. Theory of stresses is developed in such cases as a reinforced-concrete repair-dock, members bridges, etc., where passive thrust of earth occurs.

Arches

Reinforced-Concrete Arches in Construction of Ships and Hangars for Dirigible Balloons (Les voûtes en béton armé dans la couverture des bâtiments. Le hangar de Montebourg pour ballon dirigeable). Génie Civil, vol. 75, no. 10, Sept. 6, 1919, pp. 213-224, 32 figs. Design formulæ and calculations.

Code, Building, Scotland

National Building Code Adopted in Scotland Uses Quantity Surveying Methods. Contract Rec., vol. 33, no. 38, Sept. 17, 1919, pp. 878-883. Contracts are standardized by requiring all schedules for building works to adhere to same conditions.

Dams

Reinforced-Concrete Dam at Gideabacka, Sweden (Le barrage en béton armé de Gideabacka, Suède). Génie Civil, vol. 75, no. 11, Sept. 13, 1919, pp. 249-251, 14 figs. Noting especially precautions to provide against pressure of ice masses and against contraction of masonry in excessively cold weather.

Construction Features of Grand River Roller Crest Dam. Eng. & Contracting, vol. 52, no. 11, Sept. 10, 1919, pp. 289-921, 10 figs. Dam is steel roller crest surmounting concrete weir with sluiceway and canal intake with capacity of 1425 cu. ft. per sec. at one end.

Foundation, Tremied

Finishing a Tremied Foundation Under Air Pressure. Contracting, vol. 9, no. 4, Aug. 15, 1919, pp. 91-92, 3 figs. Pneumatic chambers formed in mass concrete made leaky bottom of cofferdam accessible.

Housing

Government Housing at Home and Abroad, Wm. E. Shannon. Am. Industries, vol. 20, no. 2, Sept. 1919, pp. 25-27. American types of houses considered as more practical, comfortable and more healthful to live in than European, although latter are said to have a higher architectural standard.

Steel Corporation's Alabama Developments. Iron Age, vol. 104, no. 10, Sept. 4, 1919, pp. 627-631, 12 figs. Building of homes for employees.

Reservoirs

See Roofs.

Roofs

Calculation of Wind Pressure on Arched Roofs, F. Grau. Eng. & Contracting, vol. 52, no. 9, Aug. 27, 1919, pp. 253-254, 5 figs. Method of determining forces and moments produced in parabolic fixed arches. Translated from Génie Civil, May 31.

Groined Arches or Flat Roof for Concrete Reservoirs. Eng. News-Rec., vol. 83, No. 12, Sept. 18, 1919, pp. 566-568. Opinions of various engineers and builders as to relative economy and safety, based on experience with both types through a number of years.

Snowslide Protection

Viaduct Protected from Snowslides by Concrete Walls, E. E. Adams. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, pp. 470-471, 3 figs. Bases of shore bents encased in concrete to prevent recurrence of accidents due to snowslides.

Standards

Establishing Standards in Construction, A B. Segur. Eng. & Contracting, vol. 52, no. 9, Aug. 27, 1919, pp. 242-244, 2 figs. Associated Gen. Contractors of Am., vol. 1, no. 2, Aug. 1919, pp. 9-12, 2 figs. Diagrams showing possibility of shipping labor between local industries. From report prepared for Committee on Methods of Assoc. General Contractors of America. Also abstracted in Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 854-857, 2 figs.

Steel Construction

The Standard Unit System of Steel Construction, R. R. Reid. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 862-863, 2 figs. Development in England.

Stucco Work

Making a Success of Stucco Work. Building Age, vol. 41, no. 9, Sept. 1919, pp. 284-285, 2 figs. Framing and methods of application that prevent cracks, as recommended in extracts from Committee Report of Am. Concrete Inst.

Tanks

Tank Construction—XXXI, Ernest G. Beck. Mech. World, vol. 66, no. 1703, Aug. 22, 1919, pp. 91-92, 5 figs. Design of supports, stays, and connections for side wall of rectangular tanks. (Continuation of serial.)

Underpining

Underpinning a 6-Story Iron, Glass and Brick Wall. Contracting, vol. 9, no. 4, Aug. 15, 1919, pp. 107-108, 1 fig. Also Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 864-865. Work done in strengthening and extending footings so as to increase their strength and reliability without disturbing them or impairing their stability during operation.

Wind Pressure

See Roofs.

Wind Pressure on Cylindrical Structures in Practice, R. Fleming. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 499-502. Methods applicable to various problems of structural designer in dealing with chimneys, stacks and standpipes.

CEMENT AND CONCRETE

Bonding

Bonding New Cement Mortar and Concrete to Old in Tests, W. E. Rosengarten. Public Roads, vol. 2, no. 14, June 1919, pp. 26-34, 4 figs. Results of tests carried out in engineering research laboratory of Bureau of Public Roads.

Cracks

The Significance of Cracks in Reinforced Concrete Construction, H. Stanley Harris. Surveyor, vol. 56, no. 1439, Aug. 15, 1919 pp. 103-104. Can. Engr., vol. 37, no. 13, Sept. 25, 1919, pp. 333-334. States that cracks are generally due to contraction of concrete in setting, to expansion and contraction caused by temperature changes in concrete; to too early removal of forms; to overloading of structure and to settlement of supports. From Proc. of Roy. Victorian Inst. Architects.

Diagrams, Reinforced Concrete

Calculating Diagrams for Reinforced Concrete, James Williamson. Engineer, vol. 128, no. 3320, Aug. 15, 1919, pp. 149-151, 6 figs. on supp. plates. Two types—one combination of logarithmic alignment chart with ordinary logarithmic graph and adaptable to slabs, beams, shear members, pillars, etc., and the other applicable to cases of doubly reinforced beams and rectangular sections under combined stresses, for which ordinary formulæ do not admit of direct solution.

Mixers

Better Concrete—the Problem and Its Solution, Nathan C. Johnson. Jl. Engrs. Club, Philadelphia, vol. 36, no. 178, Sept. 1919, pp. 333-341, 16 figs. With microscopic motion-picture studies as basis, type of mixer is developed in which it is claimed reaction between cement and water is promoted with greater production of useful "glue."

Reinforcements

Proof that Iron Used in Reinforced Concrete is Rustproof (Ein Nachweis für die Rostsicherheit des Eisens bei Eisenbeton), E. Probst. Armierter Beton, vol. 12, no. 5, May, 1919, pp. 105-107, 3 figs. Cites as example slabs made 33 years ago by Dyckeroff & Widman, and which were stored in the open most of the time; based on his examination of these slabs writer furthermore concludes that a depth of 1.5 cm. is sufficient to prevent iron from rusting.

Vibration

Effect of Vibration, Jigging and Pressure on Concrete, Duff A. Abrams. Eng. & Contracting, vol. 52, no. 13, Sept. 24, 1919, pp. 352-354, 7 figs. Concrete, vol. 15, no. 3, Sept. 1919, pp. 107-111, 7 figs. Effect of vibration produced by electric motor on strength of concrete; effect of consistency on strength of jigged concrete.

EARTHWORK, ROCK EXCAVATION, ETC.

Backfilling

Backfilling Tunnel with Concrete. Concrete, vol. 15, no. 3, Sept. 1919, pp. 130-131, 2 figs. Employed in connection with construction of Winnipeg aqueduct, which is 97 miles long.

Breakwaters

Building Toronto's Western Breakwater. Contract Rec., vol. 33, no. 35, Aug. 27, 1919, pp. 807-809, 4 figs. Large concrete blocks and rock fill, keyed together with mass concrete, form structure. Dredge converted for handling blocks.

Canals

Progress of Queenston-Chippawa Power Canal. Can. Engr., vol. 37, no. 9, Aug. 28, 1919, pp. 249-256, 33 figs. Loading 8500 cu. yd. on cars in 20 hours with one shovel.

Conduits

Winnipeg Circular Concrete Conduit. Contracting, vol. 9, no. 5, Sept. 1, 1919, pp. 127-128, 7 figs. Reinforced pipes 87 to 108 in. in diameter, built with steel forms set on invert in open trench.

AN AMERICAN ACHIEVEMENT

WHEN the emergency was greatest and tracing cloth was more than ever needed urgently, it was then that this only American-made tracing cloth transferred the standard of excellence to the native product.

It was proven on the drafting boards of America's largest industries to be a product of quality unsurpassed by any other. Now that imported cloth may be readily secured, have these concerns changed back to it? Our sales sheets say no!

National Tracing Cloth provides a uniform drafting surface that will endure continual wear and tear of handling, that can be scraped and rubbed, yet gives good prints, one that has a smooth, even texture and a wonderful transparency. It is backed by the guarantee that any sheet or roll which is not free from blemish will be replaced free of expense to you.

If you have been seeking an *ideal* drafting medium—here it is. A sample sheet will immediately be sent to you. Test it thoroughly. Send for it today.

A Product of the

NATIONAL TRACING CLOTH CO.

SAYLESVILLE, RHODE ISLAND

National Tracing Paper National Blueprint Cloth

National White Pencil Cloth

National

TRACING CLOTH

107-2

Demolition

Safety Measures in Demolition of Buildings Contract Rec., vol. 33, no. 39, Sept. 24, 1919, pp. 895-897, 1 fig. Suggested precautions to observe when tearing down old structures; protection of eyes; securing of beams before cutting; removal of material.

Excavation, Labor

Piece Work versus Day Labor in Hand Excavation. Everett N. Bryan. Eng. & Contracting, vol. 52, no. 12, Sept. 17, 1919, pp. 319-320. Instance illustrating advantage of piece work over day rate.

Excavator Work, Measurement of

Scottish Mode of Measurement for Preparation of Schedules of Quantities. Contract Rec., vol. 33, no. 39, Sept. 24, 1919, pp. 903-907 Standardized methods which are applied to measurement of excavator and mason work in Scottish Nat. Building Code.

Shovels, Steam

Methods of Moving Steam Shovels, J. R. Sherman. Eng. & Contracting, vol. 52, no. 12, Sept. 17, 1919, p. 318, 4 figs. Methods employed in connection with excavation of material for large earth dam for Braden Copper Co., Chile, S. A.

HARBORS

Peru

Plans for Harbor Improvements in Peru (Plannen voor verbetering van Peruaansche havens), G. J. van den Broek. Ingenieur, vol. 34, no. 35, Aug. 30, 1919, pp. 638-646, 12 figs. Mollendo, Callao, Camana and Matarani. Paper read before Department of Building and Waterways, Holland.

HYDRAULIC ENGINEERING

Flood Hazard

Widened Channel Reduces Flood Hazard at Columbus. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 512-513, 2 figs. Fixtures of spillway levee.

Scouring of Drainage Channels

Board Mattress for Preventing Scour in Drainage Channel, B. F. Burns. Eng. & Contracting, vol. 52, no 11, Sept. 10, 1919, p. 299, 4 figs. Plan, section and details.

Siphon Spillway

Dam and Tunnel Construction by the Marin Water District. Eng. & Contracting, vol. 52, no. 11, Sept. 10, 1919, p. 302, 2 figs. For providing daily draft of 15,000,000 gal. Siphon spillway of dam is designed to discharge 4,000 cu. ft. per sec.

MATERIALS OF CONSTRUCTION

Wood

"Compression" Wood and Failure of Factory Roof-Beam, G. E. Heck. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 508-509, 4 figs. Instance in which cause of sagging in roof was found to be yellow-pine beam with wood of peculiar, abnormal growth and wide annual rings.

MUNICIPAL ENGINEERING

City Planning

City Planning for Portland. Mun. Jl. & Public Works, vol. 47, no. 9, Aug. 30, 1919, pp. 133-134. Arguments for narrower roadways in minor streets. (Concluded.)

Street Cleaning

Street Cleaning and Refuse Collection in Newark. Mun Jl. & Public Works, vol. 47, no. 12, Sept. 20, 1919, pp. 180-182, 3 figs. Appliances, methods and organization in a large manufacturing and commercial city. (To be concluded.)

RECLAMATION AND IRRIGATION

Linsay-Strathmore Irrigatio District

Operation Methods and Results on the Linsay-Strathmore Irrigation District, E. Court Eaton. Eng. News-Rec., vol. 83, no. 20, Sept. 4, 1919, pp. 474-478. Well tests and reconstruction; operation results of well and main pumping plants; water hammer in wood pipe lines; repairs to steel pipes; gravity and pressure consumers' meters.

Rio Grande Irrigation Project

Drainage Works of the Rio Grande Irrigation Project, J. L. Burkholder. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 543-549, 4 figs. Elements of design, methods of ditch construction with dragline excavators on caterpillar tractors and details of cost.

ROADS AND PAVEMENTS

Bituminous Pavements

Some Practical Points to Observe in the Construction of Bituminous Pavements, R. Keith Compton. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 105-107. Specifications; inspection of hot material; brick gutters; rate of rolling.

Bituminous Road Materials

Ultra-Microscopic Examination of Disperse Colloids Present in Bituminous Road Materials, E. C. E. Lord. Jl. Agricultural Research, vol. 17, no. 4, July 15, 1919, pp. 167-176, 3 figs. partly on supplement plates. Investigation undertaken principally to develop method for counting colloidal particles in bituminous solutions.

Classification

Street Classification as an Aid to Pavement Design, James W. Routh. Mun. Jl. & Public Works, vol. 47, no. 10, Sept. 6, 1919, pp. 148-149. Relation between character and density of traffic and thickness of foundation. Opinions of several prominent municipal engineers.

The Classification of Highways, Henry G. Shirley. Good Roads, vol. 18, no. 13, Sept. 24, 1919, pp. 149-151, 2 figs. Advantages of improved roads; description of several classes and estimates of costs of improvement.

Cracking

Does Rich Concrete in Roads Crack More Than Lean? Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 518-520. Replies received from various engineers to questionnaire sent out to them by Eng. News-Rec. Answers show that there is no well-developed foundation for statement that there is greater tendency to crack in richer mixes of concrete.

Fresh Concrete Pavement, Protection of

Methods of Protecting Concrete Pavements Laid in Warm Weather. Eng. & Contracting, vol. 52, no. 10, Sept. 3, 1919, pp. 266-267, 2 figs. Suggested design for light frame to hold canvas over newly placed concrete pavement.

Granite-Block Pavement

Quick Work in Laying Granite Block Pavement, Clarence D. Pollock. Mun. Jl. & Public Works, vol. 47, no. 9, Aug. 30, 1919, pp. 128-130, 3 figs. Composition of working gangs and methods employed in paving half mile of Seventh Avenue, New York. Paving was done in 40 working days; street crossing were closed to traffic three days only.

Experience with Granite Block Pavements in New Orleans, La., John C. Bartley. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 112-115. Old Belgian block pavements; salvaging old granite blocks.

Macadam Roads

Construction of Twelve-Mile Macadam Road is Largely a Haulage Problem. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, pp. 849-850, 3 figs. Caledonia-Jarvis highway in Haldimand County, Ont., built in two sections; wagons used on one, motor trucks on the other.

Recommended Procedure in the Construction of New Macadam Roads, M. D. Ross. Mun & County Eng., vol. 57, no. 3, Sept. 1919, pp. 116-118. Characteristics of properly constructed road; equipment used on construction; preparing subgrade.

Mississippi Valley State Highway Department

Recommended Practice of Mississippi Valley State Highway Departments for Concrete Road Construction. Can. Engr., vol. 37, no. 9, Aug. 28, 1919, pp. 260-262. As adopted at conference of Miss. Valley Assn. of State Highway Depts.

Overhaul Computation

Simple Method of Computing Overhaul. Eng. & Contracting, vol. 52, no. 10, Sept. 3, 1919, p. 273, 1 fig. Employed by Minnesota State Highway Commission.

Suggestions for Contractors on Concrete Road Construction, Clyde E. Learned. Public Roads, vol. 2, no. 14, June, 1919, pp. 15-17. Concerning overhauling, proportion of subgrade, hauling materials and laying pipe line.

Road Machinery

Road Machinery, A. H. Blanchard. Better Roads & Streets, vol. 9, no. 5, June 1919, pp. 187-189 and 214. Factors determining selection of equipment for construction and maintenance of highways.

Pneumatic Tools for Breaking up Pavement, Walter P. Burn. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 583-584, 7 figs. How by using special points a tie tamping machine was used for cutting ashphalt, toothing out paving blocks and breaking up pavement.

Resurfacing

Resurfacing Old Macadam and Gravel Roadways with Special Reference to Adaptability of Old Roadbeds as Foundation for Hot-Mix Bituminous Surfaces, Hugh W. Skidmore. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 99-105, 12 figs. General requirements of pavement foundations; suitability of broken stone, stone and gravel macadam pavements as foundations for permanent types of surfaces; thickness of base; edging for highway pavements.

Standard Details

Standard Details of Pennsylvania State Highway Department for minor Features of State Roads. Eng. & Contracting, vol. 52, no. 10, Sept. 3, 1919, p. 264, 8 figs. Underdrains, plain and grouted rubble gutter, plain cement concrete gutter, concrete curbing, stone curbing.

Survey Instructions

Instructions of Arizona State Highway Department for Guidance of its Engineers. Eng. & Contracting, vol. 52, no. 10, Sept. 3, 1919, pp. 271-273. Instructions to engineers on reconnaissance surveys.

SANITARY ENGINEERING

Garbage Utilization

Profit in Garbage-Fed Hogs, E. C. W. Schubel. Am. City, City Edition, vol. 21, no. 3, Sept. 1919, pp. 217-220, 3 figs. Experience of Lansing, Mich.

Refuse Collection

The Trend in Municipal Refuse Collection and Disposal—Estimating Costs, Rudolph Hering. Mun. & County Eng., vol. 57, no. 3, Sept. 1919, pp. 107-109. The Cobwell system; garbage disposal by feeding; incineration.

Sewage Disposed

The Utilization of Sewage Sludge in Birmingham, England. Am. City, City Edition, vol. 21, no. 3, Sept. 1919, pp. 213-215, 4 figs. Shallow tanks and thorough digestion furnish sludge without odor, with possibility of organic fertilizer.

Sewage-Disposal Difficulties at Madison, Wisconsin. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 510-511, 1 fig. Improving sludge handling by hoppers and new pipe connections for flat-bottom tanks.

Sewage Treatment

Electrolytic Sewage Treatment. Mun. Jl. & Public Works, vol. 47, nos. 9 and 10, Aug. 30 and Sept. 6, 1919, pp. 131-132 and 151-152. Investigation of Easton plant by committee of Franklin Inst. Chemical and bacterial effect of treatment. Cost of treatment.

SURVEYING

Reconnaissance Mapping

Quick Method of Reconnaissance Mapping, M. L. Fuller. Economic Geology, vol. 14, no. 5, Aug. 1919, pp. 411-423. Method involves among other features taking of compass bearings to nearest 5 deg. and direct plotting of courses by standard coördinates while in motion.

Resurvey, Railway

Curve Chart for Railway Resurvey, J. G. Wetherell. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, p. 506, 1 fig Chart shows degree of curve having given angle and external.

WATER SUPPLY

Filters

High-Capacity, Self-Cleaning Filters for Purifying Water. Contract Rec., vol. 33, no. 37, Sept. 10, 1919, p. 857. Arrangement used at waterworks on Desrumaux system, in France. Translated from Génie Civil.

Purification Effected in Toronto's Water Supply by Slow Sand Filtration, N. J. Howard. Contract Rec., vol. 33, no. 38, Sept. 17, 1919, pp. 871-875. Also tests of 10,000 samples during 1918 said to show reductions of 99.7, 99.1 and 99.0 per cent in b. coli, total bacteria and excremental bacteria respectively.

Municipal Water-Works

Management of Municipal Water-Works, W. M. Rich. Am. City, City Edition, vol. 21, no. 3, Sept. 1919, pp. 209-212. Introduction of budget system, metering and water-waste surveys said to have increased economy of operation of Sault Ste. Marie water works.

San Francisco

San Francisco's Auxiliary System, Fred M. Hyde. Fire & Water Eng., vol. 66, no. 10, Sept. 3, 1919, pp. 497-499 and p. 503, 6 figs. One high-pressure hydrant claimed to give more water than three fire engines.

Storage of Water

Development and Storage of Water for Electrical Purposes, J. W. Mearles. Engineer, vol. 128, no 3321, Aug. 22, 1919, pp. 186-189, 7 figs. Conditions requisite for water power; classification according to head. Paper read before Instn. Elec. Engrs.

Water Works and Fire Insurance

Relation Between Water Works Improvements and Fire Insurance Rates, Kelsey L. Walling. Contract Rec., vol. 33, no. 36, Sept. 3, 1919, pp. 834-835. Suggestions in regard to reducing fire rates with improvements to water works.

WATERWAYS

Meanders

See River Beds.

River Beds

River Beds and Meanders, Colonel Hoc. Sci. Am. Supp., vol. 88, no. 2278, Aug. 30, 1919, pp. 134-135, 8 figs. Mechanical analysis of forces at work suggests to writer that meanders result from "buckling." Translated from Génie Civil, Paris

Mining Engineering

BASE MATERIALS

Gravel

See Sand.

Gypsum

Progress of the Gypsum Industry, Curtis F. Columbia Cement, Mill & Quarry, vol. 15, no. 5, Sept. 5, 1919, pp. 13-16, 3 figs. Prospecting, quarrying and mining, and growth of production.

Magnesite

The Magnesite Industry. U. S. Tariff Commission, Washington. 1919 23 pp. Prepared for use of Committee on Ways and Means, House of Representatives.

Magnesite: Its Geology, Products and Their Uses, C. D. Dolman. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1193-1202, 2 figs. Notes on magnesite industry in Washington and its possibilities. With abundant water-power available on Spokane, Pen d'Oreille and Kettle Rivers and with raw materials, such as clays, waste wood and magnesite in large quantities close at hand, writer sees great opportunities for building up important and revolutionizing industries in Northwest.

Sand

Nature, Origin and Properties of Sand Rock Products, vol. 22, no. 17, Aug. 16, 1919, pp. 23-25, 1 fig. Classification of sand. Physical properties. Second article

Stone

The Commercial Sizes of Crushed Stone Aggregates, F. H Jackson. Public Roads, vol. 2, no. 14, June 1919, pp 25-40. Survey of present practice in states of Ohio, Kentucky, Tennessee, North Carolina and Georgia.

COAL AND COKE

Carbonization

Carbonization of Coal, W. S. Kirkpatrick. Engr World, vol. 15, no. 5, Sept. 1, 1919, pp. 39-41. Carbonization of lignite suggested as means of great economic waste.

Coke Ovens, By-Product

Temperatures in By-Product Coke Oven Practice, R. S McBride and W A. Selwig Gas Age, vol. 44, no. 6, Sept. 15, 1919, pp. 235-237, 5 figs Accounts of tests made by chemists of U S. Bureau of Standards and U S. Bureau of Mines at Koppers plant at St. Paul.

Coke Plants

New Coke Plant of La Belle Iron Works. Iron Age, vol 104, no. 11, Sept 11, 1919, pp 699-701, 1 fig. Plant has two batteries, each of 47 standard Koppers 12½ ton ovens, and is planned to permit duplication

Coking

Coking of Illinois Coal in Koppers Type Oven, R. S McBride Gas Age, vol. 44, no 5, Sept. 1, 1919, pp. 197-201, 2 figs Operating test at St. Paul plant of Minnesota By Product Coke Co. conducted jointly by Nat. Bureau of Standards and Bureau of Mines.

Oxidation of Coal

The Oxidation of Coal, Frederick Vincent Tideswell and Richard Vernon Wheeler. Jl. Chem. Soc., vol. 115-116, no. 681, July 1919, pp. 895-902, 2 figs. Preliminary account of investigation on relative tendencies to spontaneous ignition of the several distinct portions into which a banded bituminous coal can be separated.

Pennsylvania

Low-Sulfur Coal in Pennsylvania, H. M and T. M Chance. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1459-1468. Description of deposits.

Tipples

Avoidable Degradation of Coal, Benedict Shubart. Coal Age, vol. 16, no. 10, Sept. 4, 1919, pp. 401-403, 3 figs. In tipple design, gravity is seen as convenient force to utilize, but careful control is advised.

COPPER

Concentrate, Nodulizing

Nodulizing Copper Concentrate, Oscar Lachmund. Can. Min. Inst. Bul., no. 89, Sept. 1919, pp. 950-954. Comparative study of value of briquetting, sintering and nodulizing as methods of putting concentrate in proper physical condition for blast-furnace practice.

Heath-Mining District, Idaho

The I.X.L. Copper Prospect, Robert N. Bell. Eng. & Min. Jl., vol. 108, no. 10, Sept. 6, 1919, pp. 400-402, 4 figs. Property in Heath Mining District, in Adams County, Idaho, described as a possible "porphyry copper" deposit, though evidence of zone surface oxidation is lacking.

EXPLOSIVES

Blasting

Advantages of Electrical Blasting, J. B. Stoneking. Cement, Mill & Quarry, vol 15, no. 5, Sept 5, 1919, pp. 35-37, 5 figs. For igniting blasting powder and detonating dynamite, electrical method is considered superior to others in spite of higher initial cost.

Blasting with Liquid Air in Potash Mines (Das Schiessen mit flüssiger Luft im Kalibergbau), Gropp. Kali, vol. 13, no. 6, Mar. 15, 1919, pp. 95, 6 figs. Technical and economical experience gained at Wintershall and Sachsen-Weimar mines. (Continued from no. 2.)

GEOLOGY AND MINES

Amber

Amber and Its Origin, George F. Black. Am. Mineralogist, vol. 4, no. 8, Aug. 1919, pp 97-99. Geological formation. (Continuation of serial.)

IRON

Minnesota

Minnesota State-Owned Iron Mines. Eng. & Min. Jl., vol. 108, no. 10, Sept. 6, 1919, pp. 388-389, 1 fig. Administration of commonwealth lands, leased to operators on royalty basis, with minimum yearly shipments specified, vested in state auditor and organized mines department. Official report pronounces system a success.

LEAD, ZINC, TIN

Lead Smeltery

A New South Wales Lead Smeltery. Eng. & Min Jl., vol. 108, no. 10, Sept. 6, 1919. pp. 394-395, 1 fig. Cockle Creek silver-lead works of the Sulphide Corporation, Ltd., treat complex ores by roasting and blast-furnace smelting, followed by refining of base bullion.

Zinc Ores

Zinc Ore. U. S. Tariff Commission, Washington. 1919. 46 pp. Prepared for use of Committee on Ways and Means, House of Representatives.

The Wisconsin Zinc District, W. F. Boericke and T. H. Garnett. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug 1919, pp. 1213-1235, 5 figs. Possibilities of field estimated from records of past production which is quoted as having increased from 1900 tons in 1904 to over 250,000 tons in 1917.

MAJOR INDUSTRIAL MATERIALS

Manganese

Manganese Ore. U. S Tariff Commission, Washington, 1919, 28 pp. Prepared for use of Committee on Ways and Means, House of Representatives.

Pyrites

Pyrites and Sulphur Industry. U. S. Tariff Commission, Washington. 1919. 31 pp. Prepared for use of Committee on Ways and Means, House of Representatives.

MINES AND MINING

Apex Law

New Angles to the Apex Law, John A. Shelton Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1417-1423, 1 fig. Importance of stability of titles in furthering prosperity of community.

Crushing

Crushing Practice, New Cornelis Copper Co., W. L. Dumoulin. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1203-1206. Two crushing plants: Primary plant which consists of one no. 24 Gates, style K, gyratory crusher, followed by four Gates no. 8, style K, gyratory crushers; and secondary plant which consists of four units of 48-in. Symons vertical-shaft disk crushers, each unit consisting of three crushers, one coarse Symons and two fine Symons.

Sinking the "H" Shaft at the Pabst Mine, A. J. Wagner. Eng. & Min. Jl., vol. 108, no. 12, Sept. 20, 1919, pp. 513-515, 5 figs. Sequence of operations and arrangement of equipment specially noted as factors which are said to have contributed to obtaining high drilling efficiency and low maintenance cost.

Laws

See Apex Law.

Milling

Mill Operations at United Eastern During 1917 and 1918, Wheeler O. North. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919 pp. 1171-1191, 7 figs. Notable features quoted are absence of filters and use of short peb mills loaded with steel balls for fine grinding.

Mining Methods

Geology and Mining Methods at Pilares Mine, W. Rogers Wade, Alfred Wandtke and Pilares de Nacozari. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1143-1169, 14 figs. Mine is of pyrite-chalcopyrite type occurring in latite and andesite breccias of early Tertiary age.

Stoping

Economy of Machine Stoping, S. A. Min. & Eng Jl., vol. 28, no. 1454, Aug. 9, 1919, pp. 639 Figures relative to operations on narrow tin lode.

Timbering

The Preservation of Mine Timber, N. T. Williams. Trans. Instn. Min. Engrs., vol. 57, no 3, July 1919, pp. 125-133, 4 figs partly on supp. plate. Survey of various methods of treatment.

MINOR INDUSTRIAL MATERIALS

Tungsten-Bearing Ores

Tungsten-Bearing Ores. U. S. Tariff Commission, Washington, 1919. 47 pp Prepared for use of Committee on Ways and Means, House of Representatives.

Wulfenite

Notes on the Metallurgy of Wulfenite, J. P. Bonardi. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 364-369. Source and importance of wulfenite; description of its metallurgical treatment, acid leach, alkaline leach and fusion methods; comparison of these methods; costs of treatment; tabulated results.

OIL AND GAS

Alsace

Oil in Alsace (Le pétrole d'Alsace), Aime Witz. Revue générale de l'Electricité, vol. 6, no. 8, Aug. 23, 1919, pp. 244-250, 1 fig. Survey of various deposits indicating quality of oil found in each; also economical study of their exploitation.

PRECIOUS MINERALS

Alaska

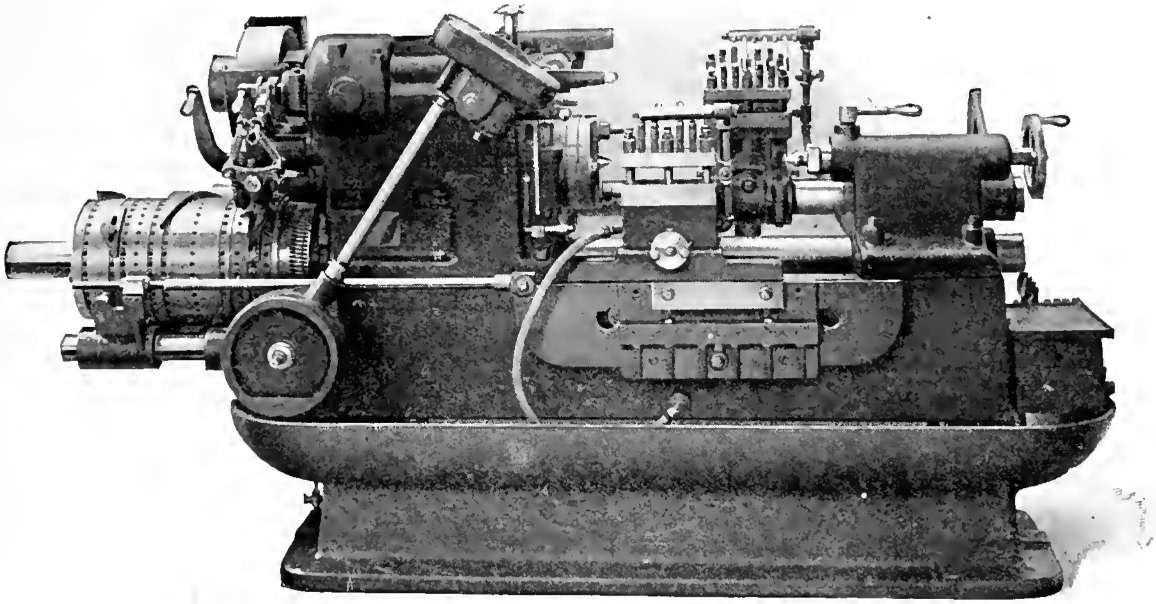
Mining in Chistochina Basin, Prince William Sound Region, and Kenai Peninsula, Alaska, Theodore Chapin and Bertrand L. Johnson. Dept. of Interior, U. S. Geological Survey, Bulletin 692 C, 1919, pp. 137-176, 3 figs. Including notes on geology of platinum-bearing auriferous gravels.

See also Platinum.

Platinum

Geology of Platinum Deposits—I and II, W. L. Uglow. Eng. & Min Jl., vol 108, nos. 9 and 10, Aug. 30 and Sept 6, 1919, pp. 352-355 and 390-393 Aug 30: Formations and occurrences. Sept. 6: Occurrences in association with other minerals; production of various districts.

The Fay Automatic Lathe



An automatic machine for simultaneous turning, facing and shouldering cuts on bar stock and centered forgings, such as pinion shafts, steering knuckles, cam shafts, etc.

An automatic machine for second operations on work held on centered arbors, such as spur and bevel gear blanks, hubs, pulleys, etc.

Designed with strength and driving power to carry all the tools, speed, and feed the work will stand under balanced cuts.

Jones & Lamson Machine Company

SPRINGFIELD, VERMONT, U. S. A.

109 Queen Victoria Street, London, E. C

France, Spain and Belgium: F. Auberty & Co., 91 Rue de Maubeuge, Paris
Holland: Spliethoff, Beeuwkes & Co., Rotterdam

SEE OUR DATA IN 1919 A.S.M.E. CONDENSED CATALOGUES OF MECHANICAL EQUIPMENT

TRANSPORTATION

Cables, Stresses

Stresses in Mine Cables (Sur les efforts dans les cables), M. E. Dessalles. Annales des Mines de Belgique, vol. 20, no. 3, 1919, pp. 1079-1087, 4 figs. Result of experiments to determine coefficient of elasticity and velocity of propagation of stress suddenly applied.

Haulage, Underground

Efficiency in Underground Haulage, C. E. Bowron. Coal Age, vol. 16, no. 9, Aug. 28, 1919, pp. 360-361. Suggests making some one responsible for each operation or for each department.

Metallurgy

ALUMINUM

Alloys

Constitution and Metallography of Aluminum and Its Light Alloys with Copper and with Magnesium, P. D. Merica, R. G. Waltenberg and J. R. Freeman, Jr. Dept. of Commerce, Scientific Papers of Bur. of Standards, no. 337, Aug. 16, 1919, pp. 105-119, 28 figs. partly on eight supp. plates. Temperature-solubilty curves of $CuAl_2$ and Mg_4Al in aluminum determined by method of annealing and microscopic examination. Aluminum said to dissolve about 4 2 per cent copper as $CuAl^2$ at 525 deg. cent. and about 12.5 per cent magnesium as Mg_4Al at 450 deg. cent.

Aluminum Alloys (Quelques Alliages divers d'Aluminum), J. Escard. Metaux, Alliages et Machines, no. 7-8, July-Aug. 1919, pp. 1-4. Alloys used for making machine parts which are subjected to continuous friction. (Concluded.)

Aluminum, Aluminum Alloys and Their Strengths (Betrachtungen über Aluminum, Aluminiumlegierungen und der en Festigkeit), Hugo Rieger. Giesserei-Zeitung, vol. 16, no. 10, May 15, 1919, pp. 151-153. Results of tests made by German Imperial Navy Office. Composition of various alloys. (Concluded.)

Studies of Technical Aluminum Alloys (Studien über techoische Aluminiumlegierungen), E. H. Schulz. Metall und Erz, vol. 7, no. 5, March 8, 1919, pp. 91-101, 30 figs. Aluminum alloys, partly annealed and partly cold-worked were tested as to their strength and resistance to corrosion; these alloys contained besides small quantities of manganese and magnesium either 7 per cent zinc or copper up to 4 per cent.

BLAST FURNACES

Air Preheating

Conditions Required for Obtaining Favorable Results in Preheating of Air in Blast Furnaces (Die thermischen, baulichen und betrieblichen Bedingungen für einen günstigen Wirkungsgrad der Winderhitzung bei Hochöfen), Hugo Bansen. Stahl u. Eisen, vol. 39, no. 19, May 8, 1919, pp. 493-497, 5 figs. Amount of air and temperature of air; heating area; size of heater, radiation losses and their dependence on amount of exhaust and its velocity. (To be continued.)

Electric Furnace Developments for Metals. Metal Indus., vol. 17, no. 9, Sept. 1919, pp. 424-427, 6 figs. Crucible in which heat is produced directly in crucible wall.

Electric Furnaces, Testing

Commercial Testing of Metallurgical Electric Furnaces, H. M. St. John. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 377-392, 5 figs. Interpretation of collected data, summarizing results, conclusions as to suitability, reliability, production, cost of operation and maintenance and other considerations.

Gas Washers

Increasing Wet Gas Washer Efficiency, George B. Cramp. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 430-432. Suggests use of corrugated sheets for baffles in blast-furnace gas washer to more thoroughly clean gas and to increase available cleaning surface.

FLOTATION

Colloids

Notes on Troubles from Colloids in Flotation. Eng. & Min. Jl., vol. 108, no. 12, Sept. 20, 1919, pp. 510-512. Survey of opinions of flotation experimenters, particularly in regard to whether physical or chemical qualities of primary slime are responsible for its action on flotation.

FURNACES

Application of Electrical Energy to the Melting of Metals, H. A. Greaves. Elecn., vol. 83, no. 2155, Sept. 5, 1919, pp. 256-257, 5 figs. Method said to enable three-phase or two-phase current to be applied to a furnace with unequal resistance in one of phases and still maintain a balanced load as regards both power and power factor on primary phase. From paper read before Instn. Elec. Engrs.

Operating Brass-Making Induction Furnaces, R. N. Blakeslee, Jr. Elec. World, vol. 74, no. 12, Sept. 20, 1919, pp. 642-644, 4 figs. Experience dealing with problems of furnace lining, charging, mixing of zinc and removal of zinc oxide deposit.

IRON AND STEEL

Carbon-Free Alloys

Electric Production of Carbon-Free Alloys, E. F. Northrup. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 258-259, 2 figs. Scheme of furnace.

Cast Iron

Cast Iron under Heat Influences, E. Adamson. Iron & Coal Trades Rev., vol. 99, no. 2686, Aug. 22, 1919, pp. 239-240, 2 figs. Experiments made by writer and other investigators studied to determine influence of temperature on molecular structure of cast iron.

Composition

The Effect of Certain Elements on the Properties of Steel, N. J. Gerbert. Jl. Am. Steel Treaters Soc., vol. 1, no. 10, Sept. 1919, pp. 349-359. Shows by means of examples how to proceed in order to obtain a steel complying with specific requirements from a carbon steel containing a known percentage of carbon.

Ferrite Crystallization

Inclusions and Ferrite Crystallization in Steel, Edward G. Mahin. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 739-745, 33 figs. Technical study and experimental research lead to following conclusions: (1) Recurrence of ferrite ghosts after repeated thermal treatment is due largely to phosphorus banding, and (2) that even after phosphorus distribution has been made uniform, repeated heating followed by slow cooling still leaves inclusions surrounded by ferrite.

Fractures

On the Inter-crystalline Fracture of Metals under Prolonged Application of Stress (Preliminary Paper), Walter Rosenhain and Sydney L. Archbutt. Proc. Roy. Soc., vol. 96, no. A674, Aug. 1, 1919, pp. 56-68, 8 figs. partly on three supp. plates. As result of observations theory is put forward that constituent crystals of metal are held together by amorphus intercrystalline cement, which in some metals is sufficiently mobile to yield to tendency of any applied stress to produce flow.

High-Speed Steel

British Practice in High-Speed Steel. Iron Age, vol. 104, no. 11, Sept. 11, 1919, pp. 702-707, 8 figs. Investigation of forging operations of cogging, rolling, etc. It is believed that, for an efficient forging, temperatures must be used which are appreciably higher than those generally accepted as correct.

Impurities

Reducing Non-Metallic Impurities in Steel, L. B. Lindemuth. Blast Furnace & Steel Plant, vol. 7, no. 9, Sept. 1919, pp. 445-447. Selection of runner bricks, temperature control and rate of pouring considered as essential. First-quality bricks for ladle lining.

Inclusions

See Ferrite Crystallization.

Lime

The Uses of Lime in Ore Dressing and Metallurgy, Paul T. Bruhl. Rock Products, vol. 22, no. 16, Aug. 16, 1919, pp. 33-35. Noting limited impurities.

Sheet Manufacture

Features of the Iron and Steel Sheet Industry—II. Raw Material, vol. 1, no. 6, Aug. 1919, pp. 290-297, 10 figs. Commercial varieties of sheets and qualities imparted to them by different processes.

MICROPHOTOGRAPHY

Aluminum Ingot

Metallography of Aluminum Ingot, Robert J. Anderson. Chem. & Metallurgical Eng., vol. 21, no. 5, Sept. 1, 1919, pp. 229-234, 32 figs. Study of microstructure, with notes on influence of quality of ingot on resultant castings and a tentative explanation of differential etching. Extract from forthcoming publication of Bur. of Mines.

Steel, Galvanized

Metallographical Study of Galvanized Steel (in Japanese), Y. Taji. Jl. Soc. Naval Architects, vol. 24, Apr. 1919.

NON-FERROUS ALLOYS

Brass

Thermal Expansion of Alpha and of Beta Brass between 0 and 600 deg. Cent. in Relation to the Mechanical Properties of Heterogeneous Brasses of the Muntz Metal Type, P. D. Merica and L. W. Schad. Bul. Bur. of Standards, vol. 14, no. 4, July 12, 1919, pp 571-590, 15 figs. Measurements showing difference in thermal expansion of alpha and of beta brass of compositions which normally are in equilibrium in such alloys as Muntz metal, naval brass, etc.

Lead Alloys

Lead-Sodium-Mercury and Lead-Sodium Tin Alloys (Ueber Blei-Natrium-Quecksilber- und Blei- Natrium-Zinn-Legierungen), J. Goebel. Zeitschrift des Vereins deutscher Ingenieure, vol. 63, no. 19, May 10, 1919, pp. 424-430, 32 figs. Constitution, hardness, flexibility.

Zinc Alloys

Study of Copper-Aluminum-Zinc Alloys with High Percentage of Zinc (Studie über die hockzinkhaltigen Kupfer-Aluminium-Zink-Legierungen), E. H. Schulz and M. Waehlert. Metall und Erz, vol. 7, no. 8, Apr. 22, 1919, pp. 170-176, 38 figs. partly on supp. plate. Thermic and metallographic tests: Zn-Cu and Zn-Al systems; surface of melting diagram. (To be concluded.)

Aeronautics

AIRCRAFT

Balloons, Observation

Observation Balloons (L'aérostation d'observation), M. Georges. Aéronautique, vol. 1, no. 3, Aug. 1919, pp. 105-111, 11 figs. Their origin and development, notably during the war.

Electrostatic Effects

Electrostatic Effects on Airships, Gordon S. Fulcher. Aviation, vol. 7, no. 4, Sept. 15, 1919, pp. 174-176. Results of experiments conducted at Princeton University and in wind tunnel at Navy Yard, Washington, to determine safety precaution in design, construction and operation of airships necessary because of electrostatic effects.

Mooring Gear

See Landing Gear.

Naval Airships

Naval Airships (L'aérostation maritime), Génie Civil, vol. 75, no. 7, Aug. 16, 1919, pp. 141-147, 7 figs. Types of the French and Italian navies.

United States

Airship Engineering Progress in the United States, J. C. Hunsaker. Aviation, vol. 7, no. 3, Sept. 1, 1919, pp. 123-128, 9 figs. Suspension systems and valve construction; features of C class. (Concluded.)

United States Navy

The U. S. Navy B-Class Dirigible. Aerial Age, vol. 10, no. 1, Sept. 15, 1919, p. 19, 3 figs. Sketch showing arrangement of parts.

Vickers

"Milestones" (Airships). Vickers. Flight, vol. 11, no. 34, Aug. 21, 1919, pp. 1121-1130, 20 figs. British Admiralty types developed from 1913 to 1918.

Wiring, Stresses

Tensions in Transverse Wiring of a Rigid Airship Due to Deflated Gas Bag, E. H. Lewitt. Aeronautics, vol. 17, no. 302, July 31, 1919, pp. 121-123, 3 figs. Deflation diagram of circular shape having axial wire passing through center.

APPLICATIONS

Commercial Flying

Commercial and Pleasure Flying, Claude Graham-White. Aeronautical Jl., vol. 23, no. 101, May 1919, pp. 231-256, 13 figs. Considerations in regard to safety, reliability, and commercial value of flying together with illustrations of various models developed for carrying passengers.

AUXILIARY SERVICE

Parachutes

Aviation Parachutes (Les parachutes d'aviation), L. P. Frantzen. Aérophile, vol. 27, no. 13-14, July 1-15, 1919, pp. 211-217, 8 figs. Particulars of various types developed in U. S., England and France. (To be continued.)

DESIGN

Some Points in Aeroplane Design, F. S. Barnwell. Aeronautical Jl., vol 23, no. 102, June 1919, pp. 301-325, 10 figs. Concerning form of aerofoil section, optimum position for main spars of aerofoil and question of economic position of points of support.

Ceiling

Formulæ for Practical Calculation of Ceiling of Aircraft (Näherungsformeln zur praktischen Berechnung der Hohenleistung von Flugzeugen), P. Jaray. Zeitschr. f. Flugtechnik und Motorluftschiffahrt, vol. 10, no. 7/8, Apr. 26, 1919, pp. 73-82, 5 figs. Tables and curves showing altitude and velocity calculations.

Linear Flight

Notes on Flying (Indications sur le problème de l'avion), M. Devillers. Aéronautique, vol. 1, no. 2, July 1919, pp. 22-28, 3 figs. Technical study of linear flight; experiments to determine efficiencies of various problems differing in ratio of pitch to diameter. (To be continued.)

Performance Formulæ

Predicting the Performance of an Airplane, V. E. Clark. Aviation, vol. 7, no. 4, Sept. 15, 1919, pp 168-174, 16 figs. Curves for estimating absolute ceiling, climb and maximum and minimum horizontal speeds at any working altitude.

DYNAMICS

High-Speed Aerodynamic Phenomena

Studies in High-Speed Aerodynamic Phenomena, F. W. Caldwell and E. N Fales. Automotive Industries, vol. 41, no. 9, Aug. 28, 1919, pp. 422-426, 13 figs. Comment on workings of army high-speed wind tunnel at McCook Field, Dayton, Ohio.

ENGINES

Rotary Engines

German Type of Double Rotary Aircraft Engine. Automotive Industries, vol. 41, no. 11, Sept. 11, 1919, pp. 514-515, 1 fig. Siemens & Halske Power plant which appeared in single-seater scout plane near end of war. Cylinders and crankshaft rotate in opposite directions.

Supercharging

How to Get Maximum Efficiency of Supercharged Motors Giving Constant Power at all Altitudes (Emploi des moteurs suralimentés à puissance constante à toutes les altitudes). Aéronautique, vol. 1, no 2, July 1919, pp. 17-22. It is recommended that calculation of speed propeller be run at various altitudes.

Vibration

Airplane Engine Vibration, Glenn D. Angle. Aviation, vol. 7, no. 3, Sept. 1, 1919, pp. 118-122, 6 figs. Technical study of its causes and manner of preventing it.

MATERIALS OF CONSTRUCTION

Fabric and Dope

Fabric and Dope, with Special Reference to Deterioration of Strength and Tautness, F. W. Aston. Aeronautical Jl., vol. 23, no. 101, May 1919, pp. 213-230, 10 figs. Sunlight is claimed to be only serious deteriorating agent; a curve is given showing change in rate of strength throughout year, effect being very great in summer and practically negligible in winter.

Plywood

Tests on Thin Plywood as a Substitute for Linen in Aeroplane Construction, Armin Elmendorf. Aerial Age, vol. 9, no. 24, Sept. 1, 1919, pp. 1135-1136 and p. 1147, 4 figs. At Forest Products Laboratories of U. S. Forest Service, Madison, Wis.

Wood

Selecting Wood for Airplanes, Arthur Koehler. Sci. Am. Supp., vol. 88, no. 2279, Sept. 6, 1919, pp. 148-149, 5 figs. Discussion of considerations necessary in selecting materials and the effects of some hidden defects.

See also Plywood.

Splintering of Airplane Woods, G. E. Heck. Sci. Am. Supp., vol. 88, no. 2274, Aug. 2, 1919, pp. 68-69, 4 figs. Tests of different airplane woods to determine relative splintering under rifle fire, conducted at U. S. Forest Products Laboratory, Madison, Wis.

Treatment, Seasoning and Working of Spruce for Airplanes (Manutention, magasinage et entretien des bois de sapin pour aéroplanes). Génie Civil, vol. 75, no. 11, Sept. 13, 1919, pp. 251-253, 2 figs. Account of processes followed and of experiments performed to determine physical properties of various samples.

METEOROLOGY

Atmosphere Sounding

Sounding of Very High Regions of Atmosphere with Long-Range Artillery (Sondage de la très haute atmosphère par l'artillerie à longue portée), A. de la Baume-Pluvinel. Aérophile, vol. 27, no. 13-14, July 1-15, 1919, pp. 209-210. Concerning requirements which must be possessed by shells capable of being sent to height in neighborhood of 50 miles.

Clouds, Measurement of Water

Measurement of Water in Clouds, L. F. Richardson. Proc. Roy. Soc., vol. 96, no. A674, Aug. 1, 1919, pp. 19-31, 3 figs. How to measure diminution by clouds of difference of brightness at edge of sun's disk by special photometer.

Stirring, Atmospheric, Measurements of

Atmospheric Stirring Measured by Precipitation, Lewis F. Richardson. Proc. Roy. Soc., vol. 96, no. A674, Aug. 1, 1919, pp. 9-18. Equation for diffusion is investigated in general case in which atmospheric distance and degree of turbulence must both be regarded as varying with height.

United States Army

Some Scientific Aspects of the Meteorological Work of the United States Army, Robert A. Millikan. Proc. Am. Philosophical Soc., vol. 58, no. 2, 1919, pp. 133-149, 8 figs. Scientific interest seems to center about (1) extension of knowledge of law of motion of pilot balloons, (2) procurement of data and development of methods for preparation of artillery range tables, (3) development of long-range propaganda balloons, and (4) charting of upper air in United States and overseas in aid of aviation.

Wind Velocity at High Altitudes in Clear Weather (Sur la vitesse du vent dans la haute atmosphère par temps clair), Ch. Maurain. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 2, July 15, 1919, pp. 79-82, 1 fig. Measurements taken from balloons at altitudes exceeding 32,800 ft

PRODUCTION

Standardization

Standardization in Aircraft Construction (Normung im Luftfahrzeugbau). Zeitschr. f. Flugtechnik und Motorluftschiffahrt, vol. 10, no. 5-6, Mar. 29, 1919, pp. 45-61. Standards for bolts, screws, cables, sheets, tubes, etc.

PLANES

B. A. T.

The B. A. T. Four-Seater Biplane. Aerial Age, vol. 9, no. 26, Sept. 8, 1919, pp. 1172-1174, 7 figs. Biplane designed either for passenger work or for carrying mail. From Flight.

German Giant Aircraft

Development of Giant Aircraft Construction in Germany during the War (Die Entwicklung des deutschen Riesenflugzeugbaues während des Krieges), A Baumann. Zeitschr. des Vereins deutscher Ingenieure, vol. 63, no. 22, May 31, 1919, pp. 497-504, 10 figs. Description of C, G, R, and Lenz types.

See also Hydroaeroplanes, German.

Hydroaeroplanes, German

Development of German Hydroaeroplane Construction (Die Entwicklung des deutschen Seeflugzeuges), Werner v. Langsdorff. Schiffbau, vol. 20, no. 16, May 28, 1919, pp. 423-427, 10 figs. Description of AEG, Ago, Albatros, Friedrichshafen and other types.

Lawson

The "Lawson" Aerial Transport. Flight, vol. 11, no. 37, Sept. 11, 1919, pp. 1220-1222, 6 figs. Power is supplied by two Liberty engines of 400 hp. each. Overall length is 47 ft. 7 in., overall height 14 ft.; speed is 100 m.p.h.

Nieuport

British Nieuport Aeroplanes. Aeronautics, vol. 17, no. 301, July 24, 1919, pp. 94-95, 6 figs. Economy claimed in manufacture by use of rectangular section struts, streamlining being effected by means of fabric fairing.

Westland

The Westland Limousine. Aeronautics, vol. 17, no. 303, Aug. 7, 1919, p. 133, 1 fig. Flight, vol. 11, no. 35, Aug. 28, 1919, pp 1145-1148, 6 figs. Four-seater commercial biplane; length 28 ft. 6 in., wing span 38 ft. 2 in.; speed at 10,000 ft. 91 miles; fitted with 275-hp. Rolls-Royce Falcon engine.

RESEARCH

Stanford University

The Stanford University Aerodynamic Laboratory, E. J. Baughman. Aviation, vol. 7, no. 4, Sept. 15, 1919, pp. 183-184, 4 figs. With reference particularly to wind tunnel.

Licensing of Engineers

The Licensing of Aeronautical Engineers and the Inspection of Aircraft, G. Edward Barnhart. Aviation, vol. 7, no. 3, Sept. 1, 1919, pp. 128-129. Suggestions in regard to licensing, making inspection reports, and maintaining logbooks.

Marine Engineering

AUXILIARY MACHINERY

Gyrostabilizer

On Gyrostabilizer for Ships (In Japanese), N. Watanabe. Jl. Soc. Naval Architects, vol. 24, Apr. 1919.

SHIPS

Air Flow Over Rear Deck

Air flow Over Rear Deck of Battleship Pennsylvania, A. F. Zahm. Jl. Franklin Inst., vol. 188, no. 3, Sept. 1919, pp. 389-397, 11 figs. Tests made with navy model of battleship Pennsylvania, both in natural condition and with shelving deck placed above rear part, in 8-ft. x 8-ft. wind tunnel, to determine aerodynamical and structural conditions suitable for landing light airplanes upon afterdeck of full-scale ship.

Barges

Designs Modern Inland Barges. Mar. Rev., vol. 49, no. 10, Oct. 1919, pp. 461-463, 6 figs., partly on supp. plate. Details of various types of barges and towboats.

Canal Vessels

See River and Canal Vessels.

Cargo Steamers

See Freight Steamship.

Chinese-Built Steamers

The Chinese-Built Passenger and Cargo Steamers "Mylie" and "Gweneth." Shipbuilder, vol. 21, no. 109, Sept. 1919, pp. 135-138, 2 figs. Principal dimensions are: length overall, 261 ft.; length between perpendiculars, 250 ft.; breadth molded, 40 ft.; depth molded, 40 ft.; dead weight loaded, 3000 tons.

Composite Ships

Ballin Composite Ships of 4,400 Tons D W. Mar. Eng., vol. 24, no. 10, Oct. 1919, pp. 680-684, 11 figs., partly on supp. plates. Outstanding feature of hull is steel topside construction in combination with double diagonal planking under fore-and-aft course of heavier outside planking.

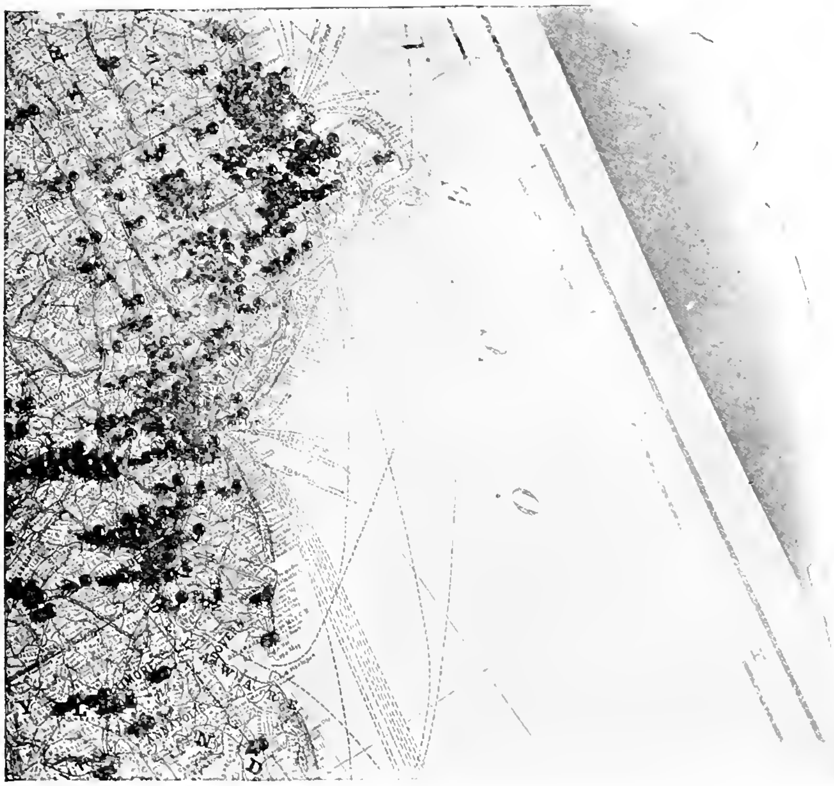
Concrete Ships

Reinforced-Concrete Barges and the Navigation on the Seine During Hostilities (Les chalands en ciment armé et la navigation sur la Seine pendant les hostilités), Ch. Lavaud. Mémoires et compte rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, no. 4, 5 & 6, Apr.-June 1919, pp. 163-178. From technical considerations as well as statistics of operation it is concluded that industrial value of reinforced-concrete barges has been sufficiently established

Precast Members Used for British Concrete Barges. Eng. News-Rec., vol. 83, no. 11, Sept. 11, 1919, pp. 507-508, 7 figs. Details of members of precasting concrete bridges of 1,000 tons capacity.

The Resistance of Ships (in Japanese), N. Yokota. Jl. Soc. Naval Architects, vol. 24, Apr. 1919

Resistance Tests of Keels Used in Mercantile Vessels (Essais de résistance des carènes appliqués à des navires de commerce), Ch. Doyere. Bulletin Technique du Bureau Veritas, vol. 1, nos. 2 and 3, July-Aug. 1919, pp. 19-24 and pp. 35-43, 19 figs. Precautions to be taken and reservations to be introduced in interpreting experiments conducted with models. Tests at Grenelle basin discussed and interpreted.



That Feeling of Security

called confidence should be the final factor in the selection of power plant equipment. To sign a contract without it would be to admit you were taking a chance.

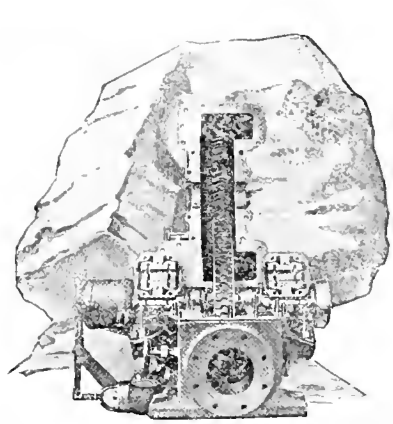
The pins in the map indicate towns or cities in which there are from one to two hundred Terrys each and, although this is a densely populated part of the country, less than one-tenth of all the Terrys are installed here. Yet, if the Terrys in Massachusetts alone were evenly spaced over the State, you couldn't get more than a mile away from one. Because of this vast number of Terry installations, it is obvious that a man who specifies

THE TERRY TURBINE

for Generator, Blower or Pumping units knows that he is not taking a chance. He is following the good judgment of thousands of engineers who know by experience what Terry service means. There is a sphinx-like stolidity behind equipment used so extensively which brings that feeling of security to the man who specifies Terry

Select your equipment with confidence.

Specify Terry



T-657

The Terry Steam Turbine Co.

Terry Square, Hartford, Conn.

Design

Center of Gravity in Ship Construction (Schwerpunktslagen), Wilhelm Schmidt. Schiffbau, vol. 20, no. 15, May 14, 1919, pp. 389-393, 6 figs. Describes simple method for determining center of gravity of area, outlines of which correspond to parabola of *n*th degree.

See also Air Flow.

New Data on Ship Stresses. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 550-553, 10 figs. Results of strainograph measurements on ships at sea and during launching. Strainograph registers changes in gage length by drawing curve on moving strip of paper.

Extensometer, Recording

A Recording Extensometer and the Measured Stresses in a Concrete Hull, Franklin R. McMillan. Eng. & Contracting, vol. 52, no. 13, Sept. 24, 1919, pp. 360-362, 10 figs. Strainograph used for measuring stresses in vessel during launching and under actual conditions of service. From paper presented at annual meeting of Am. Concrete Inst.

Italian Geared Turbine Cargo Steamers, C. E. Spinnler. Pac. Mar. Rev., vol. 16, no. 9, Sept. 1919, pp. 77-82, 13 figs. Details of Franco Tosi turbine installation on 8000-ton cargo steamers.

Skinner & Eddy's 10,400-Ton Freighters. Pac. Mar. Rev., vol. 16, no. 9, Sept. 1919, pp. 97-98, 3 figs., partly on supp. plate. Length overall, 439 ft. 9½ in.; breadth molded, 55 ft.; depth molded to shelter deck, 36 ft.; designed load draft, 26 ft. 6 in.

Freight Steamships

A Modern Steel Freight Steamship, D. D. Thomas. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 592-600, 20 figs. partly on two supp. plates. Factors determining size of vessel and type of propelling machinery; details of 8800-deadweight-ton turbine driven ship.

River and Canal Vessels

Large Program of River and Canal Vessel Construction Now Under Way. Mar. Eng., vol. 24, no. 10, Oct. 1919, pp. 671-678, 10 figs. Types under construction for Railroad Administration for New York barge canal, Mississippi and Warrior River.

Rolling of Ships

Experiments on the Rolling of Ships (In Japanese), K. Suyeniro. Jl. Soc. Naval Architects, vol. 24, Apr. 1919.

Rudders, "Kitchen," Reversible

Proposed Method of Maneuvering Vessels. Motorship, vol. 4, no. 10, Oct. 1919, p. 42, 14 figs. Describes the "Kitchen" reversible rudder, consisting of two curved deflectors formed of parts of circular cylinder, partly enclosing propeller; by suitable mechanism deflectors are made to turn together in same direction or equally in opposite directions.

Trawler and Drifter Combined

A Combined Trawler and Drifter. Shipbuilding & Shipping Rec., vol. 14, no. 9, Aug. 28, 1919, pp. 237-239, 7 figs. Principal dimensions are: Length between perpendiculars, 85 ft.; breadth, 19 ft.; depth, molded, 10 ft. 3 in.

Drifters and Trawlers. Mar. Eng., vol. 24, no. 10, Oct. 1919, pp. 665-669, 6 figs. British drifters, for Canadian company, built of wood with length of 84 ft. and breadth of 19¼ ft.

TERMINALS

Drydock, Floating

Twenty-Thousand-Ton Floating Dry Dock. Mar. Eng., vol. 24, no. 10, Oct. 1919, pp. 661-665, 7 figs. Put in operation by Bethlehem Shipbuilding Corporation. Dock is of pontoon type, making use of individual wooden pontoons and continuous side wings of steel.

Seattle

World's Largest Pier for Seattle, G. F. Nicholson. Freight Handling & Terminal Eng., vol. 5, no. 8, Aug. 1919, pp. 2911-2912. Length, 2560 ft.; width, 365 ft. Type of construction and mechanical handling equipment.

YARDS

Barge Repairs

Repairing in Four Weeks a 500-Ton Reinforced Concrete Barge, Which Fell, When Being Launched, from a Height of 6 ft. (Réparation en quatre semaines d'un bateau en ciment armé de 500 tonnes, tombé, au lancement, d'une hauteur de 6 pieds), Ch. Lavaud. Mémoires et compte rendu des travaux de la Société des Ingénieurs Civils de France, vol. 72, no. 4, 5 & 6, Apr.-June 1919, pp. 179-182. Rigidity of reinforced-concrete construction evidenced by fact that straight lines of vessel in question were not deformed.

Bethlehem

Ocean-Going Tugs Built at the Moore Plant of the Bethlehem Shipbuilding Corporation, Ltd. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 587-591, 6 figs. Tugs are 150 ft. long overall, 141 ft. 3½ in. between perpendiculars, 27 ft. 6 in. molded beam, and 16 ft. 8 in. molded depth at lowest point of sheer.

Clyde

Development of a Clyde Shipyard. Shipbuilding & Shipping Rec., vol. 14, no. 8, Aug. 21, 1919, pp. 209-211, 3 figs. Plans involving laying out of six building berths, four to accommodate vessels of about 650 ft. in length, and two for ships over 750 ft. long.

Kiel

Second 40,000-Ton Floating Dock at the Kiel Imperial Ship Yards (Zweites 40,000 Tonnen-Schwimmdock der Reichswerft in Kiel), B. Meyer. Schiffbau, vol. 20, no. 17, June 11, 1919, pp. 451-458, 13 figs., partly on supp. plate. Total length of dock is 220 m., length of each pontoon, 36 m.; width, 47 m.; lifting time for maximum load, 2 hours; lowering time, 1 hour.

Malcolm Pneumatic Tools

A New Adjunct to Pneumatic and Electric Hand-Tools in Shipbuilding. Shipbuilder, vol 21, no. 108, Aug. 1919, pp. 77-78, 2 figs. Malcolm arrangement for suspension of pneumatic or other portable tools when being used on perpendicular surfaces.

Mobile

Great Shipbuilding Plant at Mobile. Subsidiary of United States Steel Corporation. Manufacturers Rec., vol. 76, no. 10, Sept. 4, 1919, pp. 115-120, 13 figs. Noting type of town building for white and colored employees.

Roumanian Shipyards

The German-Roumanian Shipyards at Giurgiu (Der deutsch-rumänische Werftbau Giurgiu), E. Foerster. Zeitschr. ds. Vereins deutscher Ingenieure, vol. 63, no. 23 and 24, June 7 & 14, 1919, pp. 525-531 and 557-561, 39 figs. Details as to economical and technical aspects, size and design of yards; housing of workmen.

Staten Island Shipyard

Staten Island Shipyard Greatly Enlarged to Meet Demands for War Work. Int. Mar. Eng., vol. 24, no. 9, Sept. 1919, pp. 608-617, 17 figs. Addition to concrete ways, 400 ft. by 60 ft. to care for construction of ships of 10,000 tons displacement. Arrangement of space beneath ways for rivet storage. Pneumatic-tool storage. Riggers loft and offices for foreman quoted as unique feature.

William Gray & Co. Shipyard

The War Shipyard of Messrs. William Gray & Co. (1918), Ltd. Shipbuilder, vol. 21, no. 108, Aug. 1919, pp. 79-94, 21 figs., partly on supp. plates. Consists of four building berths, each capable of accommodating a vessel of about 440 ft. long, with necessary shops and fitting-out quay.

VARIA

Crankshaft Repairs at Sea

An Extension Repair Job at Sea, H. W. Schreck. Motorship, vol. 4, no. 9, Sept. 1919, p. 42, 4 figs. Temporary repair of crankshaft in single-screw motorship "Lidvard" (formerly "Pangan") now belonging to Norwegian Government. Translated from Skibsbygning.

Fueling at Sea

Fueling at Sea, H. C. Dinger. U. S. Naval Inst. Proc., vol. 45, no. 199, Sept. 1919, pp. 1607-1612, 4 figs. Instructions prepared on occasion of oiling destroyers at sea. Destroyers were taken in tow abreast by collier and maintained in that position while oiling.

Navigation

Selection of Terrestrial Points of Reference in Coastal Navigation (Sul punto rilevato) A. lachino. Rivista Marittima, vol. 52, no. 7, July 31, 1919, pp. 7-27, 11 figs. Concerning probable error resulting from relative position of points selected and ratio of their distances to ship.

Towing Experiments

New Formula for Towing Experiments (Eine neue Formel für Schleppversuche), Bruckhoff. Schiffbau, vol. 20, no. 16, May 28, 1919, pp. 419-423. Developed by writer, who thinks that although the opinion may be expressed that by the new formula effective hp. values are apparently too small, it is exactly the small "effective power" between the eff. hp. calculated by this formula and the i.hp. which will help to solve the problem of actual efficiency of propeller.

Physics Cellular Structure

Cellular Solidification (Solidification cellulaire), M. C. Dauzère. Annales de Physique, vol. 12, July-Aug. 1919, pp. 5-106, 57 figs., partly on 12 supp. plates. Study of cellular structure in inanimate solids and determination of conditions under which it takes place during solidification.

Ionization

Ionization by Collision (Contribution à l'étude de l'ionisation par choc), M. Blanu. Radium, vol. 11, no. 7, May 1919, pp. 195-197, 4 figs. Experiments in air and water vapor.

Luminescence

Electrolytic Luminescence of Certain Metallic Anodes (Phénomènes de luminescence électrolytique présentés par certaines anodes métalliques) James Lavaux. Comptes Rendus des Séances de l'Académie des Sciences, vol. 169, no. 4, July 28, 1919, pp. 180-182. Anodic polarization of aluminum, magnesium, zinc and bismuth.

Railroad Engineering

CONSTRUCTION

Track Elevation

Elevation of Tracks at Aurora, W. T. Christine. Engr. World, vol. 15, no. 5, Sept. 1, 1919, pp. 17-21, 11 figs. Plans and details of construction.

Train-Shed Raising

Raising a Large Train Shed under Traffic. Ry. Age., vol. 67, no. 13, Sept. 26, 1919, pp. 609-612, 8 figs. Lackawanna lifts entire structure at Hoboken to overcome settlement and restore original clearance.

ELECTRIC RAILROADS

Freight Traffic

Mineral and Goods Traffic Electrically Operated, Theodore Stevens. Electrical Rev., vol. 85, no. 2178, Aug. 22, 1919, pp. 249-251. Comparison between British steam locomotive mineral railway and American electrified mineral railway. (To be continued.)

Locomotives

Electric Freight Locomotive of the Pennsylvania Railroad designed for Use on Heavy Grades. Ry. & Locomotive Eng., vol. 32, no. 9, Sept. 1919, pp. 260-261, 1 fig. One of interesting features is jackshaft gear which is so constructed and rim so connected to center by springs, that the whole power is transmitted through them, while design is such that up to an exertion of 25 per cent of its horsepower gear acts practically as a solid gear.

See also Regenerative Brakes.

New Electric Locomotives for the Hydro-Electric Power Commission, F. A. Gary. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 563-567, 2 figs. Description of six new 100,000-lb. electric locomotives being built for use on Niagara Construction Railway.

Regenerative Brakes

Trial Trips of Alternating Current Locomotive with Electric Regenerative Brakes (Versuchsfahrten einer Wechselstromlokomotive mit elektrischer Nutzbremsung), Hans Behn-Eschenburg. Schweizerische Bauzeitung, vol. 74, no. 7, Aug. 16, 1919, pp. 84-89, 5 figs. partly on supp. plate. Refers to article published in latter part of 1918 in Schweiz. Bauzeitung concerning new regenerative brake for a. c. locomotives. Present article supplements former and gives data in regard to practical tests, curves, wiring diagram of motor, etc.

Three-Wire System

Continuous Current Overhead Systems for Suburban Railway Electrification, E. Goolding. Tramway & Ry. World, vol. 46, no. 8, Aug. 14, 1919, pp. 72-74, 3 figs. Three-wire system using low-pressure continuous-current machines in series.

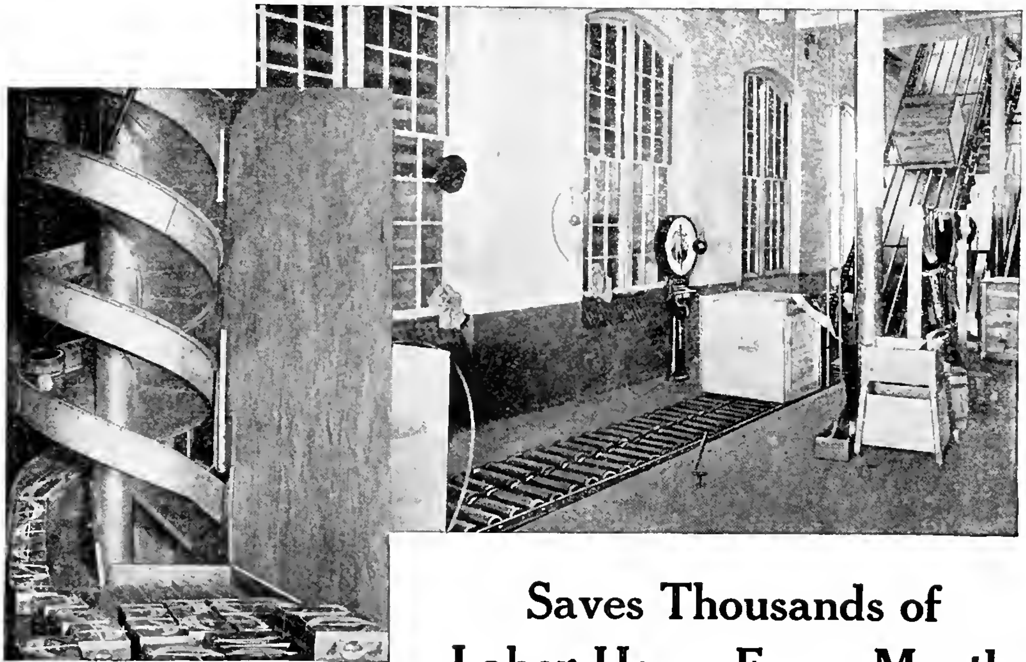
West Penn System

The West Penn System. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 531-542, 14 figs. Vast system of electric railways, light and power companies serving territory of 2500 square miles

ELECTRIFICATION

Switches

Railroad Electrification Facts and Factors, A. J. Manson. Ry. Elec. Engr., vol. 10, no. 9, Sept. 1919, pp. 311-314, 7 figs. Details of controlling apparatus and construction of electro-pneumatic unit switches.



Saves Thousands of Labor Hours Every Month

Thousands of tons in scores of factories are now *rolled* along from operation to operation on Mathews Gravity Roller Conveyers. Thousands of dollars of labor expense and thousands of labor hours are saved to these manufacturers every month. Rolling by gravity is far cheaper and far easier and far more dependable than any system of conveying by means of expensive man power.

Fifteen years devoted to designing and constructing gravity conveying equipment enables us to effect really surprising economies in your handling costs. No matter where you want your product moved in your plant, we have a dependable Mathews unit adapted to get that product where you want it, quickly, easily, on time, and without *labor cost* for moving it there.

Mathews Roller Conveyers are made in units of various standard lengths. The entire construction is designed to give great strength without excessive weight. Therefore the units can be quickly set up and taken down wherever desired as well as erected for permanent use in one location.

Send for further valuable information.

MATHEWS GRAVITY CARRIER COMPANY
136 Tenth Street, Ellwood City, Pa.

Branch Factories: **Port Hope, Ontario—London, England**

MATHEWS
SPEED ECONOMY
GRAVITY ROLLER CONVEYER

LABOR

Track Labor

Improving Efficiency of Track Labor. Ry. Rev., vol. 65, no. 12, Sept. 20, 1919, pp. 409-412. Urges construction of good, clean, commodious, comfortable and sanitary quarters for track laborers as means for improving their working efficiency. Paper read before Roadmasters & Maintenance of Way Assn.

LOCOMOTIVE

British Locomotives

The Metamorphosis of the Locomotive, H. Holcroft. Engineer, vol. 128, no. 3320, Aug. 15, 1919, pp. 153-154, 1 fig. Recent innovations to British locomotive design, such as use of three high-pressure cylinders, and carrying circular smokeboxes in saddles. Fourth article.

Locomotives

Carbonization in Valve Chambers and Cylinders of Superheated Steam Locomotives; Its Cause, Effect on Lubrication and Maintenance, and Proper Measures to Overcome it. F. P. Roesch. Can. Ry. & Mar. World, no. 259, Sept. 1919, pp. 475-477, 1 figs. Study based on analyses of deposits of foreign matter which collect in valve chambers, passages, etc.

Feedwater Heaters

A New Departure in Locomotive Feedwater Heaters. Ry. Age, vol. 67, no. 10, Sept. 5, 1919, pp. 475-476, 3 figs. Combined feed-pump and feedwater heater of open type, capable of handling 60,000 lb. of feedwater per hour.

Preheating of Feedwater in Locomotives (Vorwarmung des Speisewassers bei Lokomotiven). H. Igel. Zeitschrift für Dampfkessel u. Maschinenbetrieb, vol. 42, no. 18, May 2, 1919, pp. 130-133, 18 figs. Rieger preheater; flat-shaped preheater for locomotives produced by Atlas Works, Bremen; types constructed by Schichau and Vulcan Works; Knorr one-chamber type.

Powdered Fuel Equipment

A Pulverized Fuel Equipment for Locomotives. Ry. Age, vol. 67, no. 11, Sept. 12, 1919, pp. 519-520, 3 figs. Consists of fuel tank on tender, fuel-feeding apparatus, special arrangement of combustion chamber, slag or ash pans and smokebox.

MAINTENANCE

Bunk Cars

Some New Ideas in Bunk Car Facilities, H. F. Haag. Ry. Maintenance Engr., vol. 15, no. 9, Sept. 1919, pp. 305-307, 3 figs. Portable quarters provided for small gangs.

Upkeep of Railways

The "Upkeep" of the Railways Under Federal Control. Eng. News-Rec., vol. 83, no. 10, Sept. 4, 1919, pp. 457-459. Analysis of conditions of railway properties now as compared with Jan. 1, 1918, when they were taken over by U. S. Government.

Tank Cars

The Tank Car Maintenance Problem, Paul Bateman. Mech. Eng., vol. 41, no. 10, Oct. 1919, pp. 817-819, 3 figs. Concerning particularly repairing of friction draft gear

OPERATION AND MANAGEMENT

Explosives, Transportation of

The Safe Movement of Explosives, D. J. O'Dea. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 533-537. Duties of car inspectors and repairers in respect to shipments of explosives and inflammables.

Freight Handling

Freight Handling at Brooklyn Army Base. Eng. News-Rec., vol. 83, no. 12, Sept. 18, 1919, pp. 555-560, 5 figs. Principles and prospective methods which controlled design of huge terminal intended to care for army overseas business at port of New York.

Logarithmic Charts

The Logarithmic Chart in the Analysis of Railroad Operations, F. J. Deesen. Ry. Age, vol. 67, no. 12, Sept. 19, 1919, pp. 570-571, 6 figs. Illustrating uses of logarithmic chart.

PUBLIC REGULATION

Good Will

Acquiring Good Will. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 548-552, 14 figs. Springfield (Ohio) railways begin all over after granting of new franchise and are said to have succeeded in giving real service that is highly appreciated by public.

Japan

Railway Nationalization in Japan. Ry. Engr., vol. 40, no. 476, Sept. 1919, pp. 196-199. Account of operation under state management from 1907-1917.

Municipal Ownership

Elements of the Cost of Service. Replacements. Valuation and Rate of Return, Mortimer E. Cooley. Aera, vol. 8, no. 1, Aug. 1919, pp. 15-18. Arguments against municipal ownership of street railways.

The Advantages of Municipal Ownership and Operation of Street Railways, Glenn E. Hoover. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 544-545. Enumerates advantages accruing from municipal ownership and points out that to his knowledge, no city ever reverted from municipal ownership of street railways to private ownership.

Track Supports

Concrete for Railway Track Support. Contract Rec., vol. 33, no. 36, Sept. 3, 1919, pp. 827-831, 2 figs. Four years' experience claimed to show lower maintenance though higher first cost.

Concrete Railway Track Supports. Engr. World, vol. 15, no. 5, Sept. 1, 1919, pp. 25-28, 9 figs. Illustrating various types in operation and suggested designs. Paper read before Am. Concrete Inst.

Turntables

Recent Examples of Turntable Design. Ry. Maintenance Engr., vol. 15, no. 9, Sept. 1919, pp. 312-314, 6 figs. Two designs illustrated, one with disk-bearing center built by N. Y. Central, and one of continuous girder design built by Penna. R. R.

RAILS

Selection

Selection of Rails for Electric Railway Service, R. C. Cram. Elec. Ry. Jl., vol. 54, no. 12, Sept. 20, 1919, pp. 556-559, 6 figs. Duty required and track-maintenance details as factors in determining proper form for a rail. For determining weight of rail rule developed by Baldwin Locomotive Works is recommended.

ROLLING STOCK

All-Metal Cars

Multiple Unit Equipment for English Railway. Ry. Age, vol. 67, no. 13, Sept. 26, 1919, pp. 625-628, 4 figs. Description of all-metal cars offers opportunity for interesting comparison with similar American rolling stock.

Box Cars

Box Cars Built by C. M. & St. P. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 529-531, 5 figs. Underframe has steel center sill and wooden side sills; wooden-frame body with steel ends.

Cabooses

United States Standard Caboose Cars. Ry. Rev., vol. 65, no. 11, Sept. 13, 1919, pp. 379-380, 6 figs. Designs prepared for both steel and composite construction by Railroad Administration's Equipment Standards Committee.

Grain Elevators, Portable

Portable Pneumatic Grain Elevator, George F. Zimmer. Eng. World, vol. 15, no. 6, Sept. 15, 1919, pp. 36-38, 8 figs. Mounted upon railway rolling stock. Front end is supported on 8-wheel bogie, and rear pair of wheels being of ordinary type, while center pair can be coupled to engine so that truck can travel on its own power at rate of 5 miles per hour.

Lighting

New Developments in Car Lighting Save Money, E. Wanamaker. Ry. Age, vol. 67, no. 12, Sept. 19, 1919, pp. 567-569. Historical review of progress made from 1825 to present time, with notes on recent investigations. From paper read before Western Ry. Club.

Mail-Cars

Specifications for Steel Full Mail Cars for Canadian Railway Mail Service. Can. Ry. & Mar. World, no. 259, Sept. 1919, p. 472, 1 fig. Approved by Board of Railway Commissioners.

SAFETY AND SIGNALING SYSTEMS

Block-Signal Working Model

Southern Pacific Builds Instruction Car. Ry. Signal Engr., vol. 12, no. 9, Sept. 1919, pp. 309-311, 3 figs. Automatic block signal working model installed with other apparatus for presenting operating problems.

Blue Lights, New York Subways

Blue Lights and Their Significance in the New York Subways, Edward A. Poor. Elec. Ry. Jl., vol. 54, no 12, Sept. 20, 1919, pp. 579-581, 6 figs. Emergency precautions that have been taken to provide for the cutting off of power, the turning in of alarms and the automatic changing over to an emergency source of power for lighting.

Inspectors

Power-Saving Instruments a Long-Standing Success in Great Britain and Ireland. Elec. Ry. Jl., vol. 54, no. 11, Sept. 13, 1919, pp. 521-526, 6 figs. Value of follow-up recognized by maintaining motorman's inspector as permanent official.

Lightning Protection, Telegraph and Telephone

Telegraph and Telephone Lightning Protection Ry. Signal Engr., vol 12, no. 9, Sept. 1919, pp. 317-319, 18 figs. Purpose, scope and requirements briefly outlined with rules for applying protector principles.

Signalmen's Car

Improved Outfit Cars Produce Good Results, H. F. Haag. Ry. Signal Engr., vol. 12, no. 9, Sept. 1919, pp. 302-304, 4 figs. Layout of four-car outfit designed by Kansas City Southern for use of signalmen.

Train-Control System

Test of Automatic Train Control System. Ry. Signal Engr., vol. 12, no. 9, Sept. 1919, pp. 312-316, 8 figs. Magnetic-inductive type installed on Western Pacific and Southern Pacific in California.

SHOPS

Cylinders, Welding

Welding Locomotive Cylinders, J. B. Tynan. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, p. 540, 2 figs. Cylinder casting having large section of barrel broken off repaired by gas welding.

Electrical Equipment

Electrical Equipment of B. & O. Glenwood Shops. Ry. Elec. Engr., vol. 10, no. 9, Sept. 1919, pp. 297-304, 16 figs. With special reference to facilities for lighting, power and electric arc welding.

Round-House Design

Modern Tendencies in Round-House Design, Exum M. Haas. Ry. Mech. Engr., vol. 93, no. 9, Sept. 1919, pp. 521-522. Modern types divided into three classes—brick wall, wood frame and roof; reinforced-concrete frame and roof; and combination of steel frame and reinforced-concrete structure. From paper presented before Western Soc. of Engrs.

Tie-Treating Plant

Pennsylvania Has Novel Treating Plant. Ry. Maintenance Engr., vol. 15, no. 9, Sept. 1919, pp. 315-317, 4 figs. Portable tie-treating plant.

Wood-Preserving Plant, Portable

A Complete Wood Preserving Plant Mounted on Cars. Ry. Age, vol. 67, no. 10, Sept. 5, 1919, pp. 453-455, 4 figs. Portable equipment used by Penn. R. R.

STREET RAILWAYS

Cincinnati

Cost of Service in Cincinnati, W. C. Culkins. Elec. Traction, vol. 15, no. 9, Sept. 1919, pp. 570-572, 2 figs. Service-at-cost franchise adopted for solving street-railroad problem.

Coupling Mechanism, Automatic

Automatic Coupling Mechanism for Tramways (Autocoupleur pour tramways). Bulletin Technique de la Suisse Romande, vol. 45, no. 17, Aug. 23, 1919, pp. 171-174, 5 figs. Projecting bar operates mechanism which drops weight and engages vertical rod in hole of bar. There are two similar mechanisms, one in each tramway.

Dundee

Dundee Municipal Tramways. Tramway & Ry. World, vol. 46, no. 12, Sept. 11, 1919, pp. 131-135, 8 figs. Progressive system with prospects of extensive development.

Economic Future

Economic Future of Transportation Utilities. Elec. Ry. Jl., vol. 54, no. 11, Sept. 13, 1919, pp. 529-531. Symposium presented at Western Society of Engineers' meeting.

Electric Railway Situation

The Electric Railway Situation of the United States Summarized. Aera ,vol. 8, no. 1, Aug. 1919, pp. 8-11. Facts which have been brought out before U. S. Federal Elec. Ry. Commission appointed by the President to investigate urban transportation and its needs.

The Drive of Efficiency *The Drive of Durability*

MORSE CHAINS

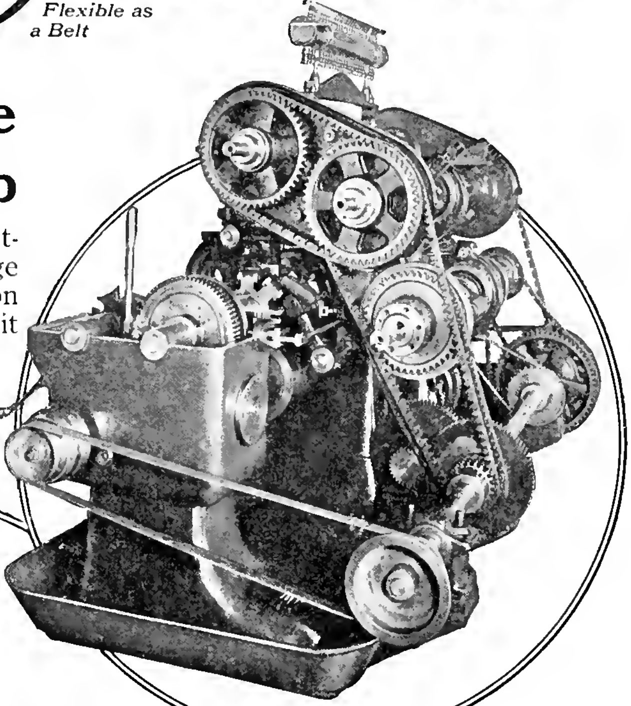
THE MORSE "ROCKER JOINT"

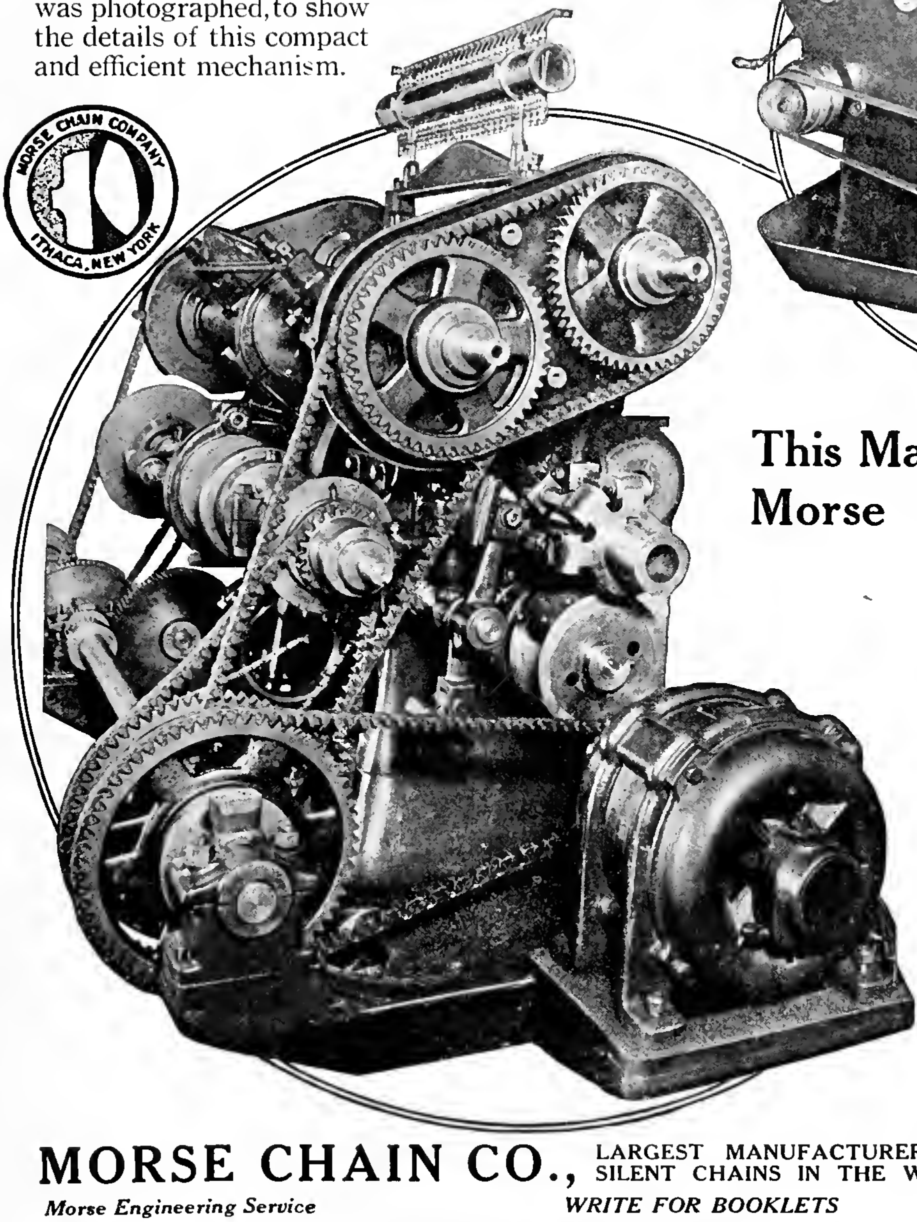
Positive as Gears *Flexible as a Belt*

Longer Life

For Economy in Space and Economy in Upkeep

This automatic hub boring machine, built by the Blomquist-Eck Machine Co., of Cleveland, Ohio, shows to advantage the application of Morse Silent Chain to speed reduction in small power drives. All guards were removed before it was photographed, to show the details of this compact and efficient mechanism.





MORSE CHAIN COMPANY ITHACA, NEW YORK

This Machine is Driven with Morse Chain Throughout

Seven Morse Silent Chains—.9″ pitch, 1″ face—transmit power from a 10 H. P. motor to and through this mechanism.

In some cases they eliminate intermediate gears; in others, bevel gears, shafts, brackets and other units which take up more space and deteriorate more rapidly.

This machine has given five years of complete satisfaction to its owners and is good for many more. The patent "Rocker Joint" reduces wear to a minimum. Easy to take up wear, when necessary. Consult us when planning important drives—large or small.

Colloidal Chemical Studies of Kongo Ruby (Kolloidchemische Studien am Kongorubin), Wolfgang Ostwald. Kolloidchemische Beihefte, vol. 10, no. 6-12, 1919, pp. 179-288, 3 figs. Study on the theory of indicators and the theory of color changes in organic matter.

Enamel Ware

Acid Test on Enamel Ware, W. D. Collins. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 757-759. Account of acid tests made on sixty-one samples of enamel ware from twenty-six different manufacturers.

Foods

The Estimation of Sulphates in a Concentrated Electrolyte and the Determination of Sulphur in Foods, Vernon K. Krieble and Autrey W. Mangum. Jl. Am. Chem. Soc., vol. 41, no. 9, Sept. 1919, pp. 1317-1328. Laboratory study of oxidation of foods by sodium peroxide and precipitation of sulphate as barium sulphate in solutions containing large amounts of sodium chloride.

Gas Mixtures

Industrial Analysis of Gas Mixtures by the Refractometric Method. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 392-393, 7 figs. How to use Lord Rayleigh's interferometer and how to interpret measurements effected with it. Translated from Chimie et Industrie, June 1919.

Glucinium

Glucinium, J. S. Negru. Chem. & Metallurgical Eng., vol. 21, no. 6, Sept. 15, 1919, pp. 353-359, 1 fig. Historical account of discovery, uses, treatments of glucinium minerals for glucina, and method of effecting chemical and electrochemical separation of glucinium.

Iron Penetration of Hydrogen

The Penetration of Iron by Hydrogen, T. S. Fuller. General Meeting of the Am. Electrochem. Soc., paper no. 9, Sept. 23-26, 1919, pp. 77-93, 4 figs. Results of experiments showing effect of various conditions on penetration of iron by nascent hydrogen at temperatures from 20° to 100° cent. It was found that velocity of hydrogen penetration is greater for a unit immersed without electrical connections in 1 per cent sulphuric acid than four units electrolyzed as cathode in like solution with current densities up to one half an ampere.

Lead

Titrimetric Determination of Antimony in Slag Lead (Über die titrimetrische Bestimmung des Antimons im Hartblei), A. Wogrinz and R. Gohring. Das Metall, no. 9, May 10, 1919, pp. 117-118. Description and results of tests; analysis of weight; titration.

Magnesium

The Alkalimetric Determination of Small Amounts of Magnesium, P. L. Hibbard. Jl. Indus. & Eng. Chem., vol. 11, no. 8, Aug. 1, 1919, pp. 753-754. Suggests changes in Bruckmiller's method for determining magnesium by titration of ammonium magnesium phosphate.

Marbles

Physical and Chemical Tests on the Commercial Marbles of the United States, D. W. Kessler. Techn. Papers Bur. Stand., no. 123, July 15, 1919, 54 pp., 8 figs. Chemical analyses made on 42 samples for purpose of classification and determination of harmful elements. Volume resistivity determinations made on a number of samples to determine their relative value for electrical insulators and the variation of this value under different conditions of moisture. Carbonic-acid tests also included.

Ocean Currents

Detecting Ocean Currents by Observing Their Hydrogen-Ion Concentration. Alfred Goldsborough Mayor. Proc. Am. Philosophical Soc., vol. 58, no. 2, 1919, pp. 150-160, 1 fig. Observations are said to have established that easterly moving water in Tropical Pacific is commonly less alkaline than that of general region in which it occurs. Having this and similar established conditions writer suggests detection of currents by testing sea water with a few drops of red dye thymolsulphonephthalein.

Ores and Alloys

A Rapid Method for Determining Nickel and Cobalt in Ores and Alloys.—III, W. R. Schoeller and A. R. Powell. Analyst, vol. 44, no. 521, Aug. 1919, pp. 275-280. Application of iodide process to certain ores and alloys.

Phenol Oxidation

Investigations included determination of temperature coefficient of solubility, pressure coefficient of solubility, hypothetical change of volume and hypothetical temperature of solubility.

PHYSICS

Acoustics

Detection of Submarine by Sound Waves (Etude des ondes acoustiques, la propagation des ondes vibratoires et l'ecoute sous-marine), H. Brille. Génie Civil, vol. 75, nos. 8 & 9, Aug. 23 & 30, 1919, pp. 171-175, and 194-199, 15 figs. Technical study of physical questions involved in transmission of sound waves through different media with special reference to submarine detection. (Continuation of serial.)

Velocity of Sound in Sea Water. (Sur une mesure de la vitesse de propagation des ondes sonores dans l'eau de mer.), M. Marti. Comptes rendus des séances de l'Académie des Sciences, vol. 169, no. 6, Aug. 11, 1919, pp. 281-282. Measurement effected by the French Naval Hydrographic Service at Cherbourg. Value obtained was 1503.5 m. per sec. at temperature of 14.5 deg. cent.

The Speed of Sound Pulses in Pipes, Arthur L. Foley. Phys. Rev., vol. 14, no. 2, Aug. 1919, pp. 143-151, 3 figs. Measured by photographic method modified so as to obtain instantaneous photograph of sound pulse part of which had come through a tube while another part had come through free air.

Sound Emitter and Sound Receiver—II (Schallgeber und Schallempfänger), W. Hahnemann and H. Hecht. Physikalische Zeitschrift, vol. 20, no. 11, June 1, 1919, pp 245-251, 2 figs. Discusses use of electro-mechanical transformer as receiver.

Emulsions

Investigations Concerning Oil-Water Emulsion, Alex. W. McCoy, H. R. Shidel and E. A. Trager. Bul. Am. Inst Min. & Metallurgical Engrs., no. 152, Aug. 1919, pp. 1513-1537, 24 figs. Laboratory experiments conducted to determine compositions and properties of emulsified oil lead to conclusions that permanent B. S. is emulsion of very small water bubbles in oil having diameter generally less than 0.5 mm. Behavior of emulsion on heating is suggested as basis for division into two groups—(1) when water separates from oil rapidly with small amount of heating, and (2) when water can be removed by distillation.

Microphones

See Acoustics.

Theoretical Basis for the Construction of Microphones (Theoretische Grundlagen zur Konstruction zweckmassiger Mikrophone), Ph. Broemser. Telegraphen - u. Fernsprech - Technik, vol. 8, no. 1, Apr. 15, 1919, pp. 6-8. Formulæ given for number of vibrations and sensitivity show that it is possible to increase number of vibrations without reducing thereby sensitivity.

Slow-Speed Tests of Kingsbury Thrust Bearings

By H. A. S. Howarth,[1] Pittsburgh, Pa.

This paper presents operating and experimental data which show the wide range of application of the Kingsbury thrust bearing, and the author gives particulars of typical installations which have been in successful operation since 1911. These bearings have been applied to vertical and horizontal hydroelectric units as well as to horizontal steam turbines and centrifugal pumps, and to determine some of the service conditions, a series of slow-speed tests was recently made on a bearing having a total area of 76 sq. in. on its four shoes and a load of 10,000 lb. Details of these tests are given, and the results obtained indicate that the lower the speed at which the bearing is run continuously, the better the conditions of the bearing surfaces. Speeds as low as 0.38 r.p.m. have thus far been employed, using, however, only a light oil.

The Kingsbury thrust bearing in its simplest form consists of one or more pivoted segments or shoes against which the thrust collar presses as it rotates. The bearing faces are copiously supplied with oil so that perfect film lubrication takes place with its resulting low friction coefficient. This bearing was invented many years ago by Albert Kingsbury, of Pittsburgh, but it met with so much conservatism on the part of engineers and manufacturers that it was slow to be taken up. The author of this paper believes there are many engineers wrestling with thrust problems who will welcome data on the wide range of usefulness of this pivoted-segment type of thrust bearing. Whether the load be great or small, or the speed be high or low, it can be applied successfully. It is the object of this paper to present operating and experimental data to show the wide range of its application to date.

A Kingsbury thrust bearing was applied to a Morgan mill in 1911 to take the bevel-pinion thrust on the horizontal drive shaft. Its characteristics are as follows: load, 66,000 lb.; 70 r.p.m.; unit thrust load, 100 lb. per sq. in.; mean surface speed, 8.4 ft. per sec. The collar is of air-furnace iron and the pivoted shoes are babbitt-faced. It runs in machine oil. The heat of friction is dissipated by its connection with an oil-circulating system, but the bearing will lubricate itself automatically from an oil reservoir in its housing if the central-station system gets out of order. This bearing has been in successful operation ever since 1911, none of its parts has ever been replaced and today it is in first-class condition.

The next application of the bearing was in a plate-glass grinding and polishing machine in 1911. This bearing, of the vertical type, was placed below the lower end of the spindle. It was designed to carry a load of 160,000 lb. at 35 r.p.m. with a unit thrust of 980 lb. per sq. in. Its mean surface speed is 2.1 ft. per sec. On account of the high unit pressure and slow speed the collar was made of chilled iron and the shoes of bronze, and the oil used was very heavy. Its service requires alternate runs of two to three hours and stops of about one hour. A conservative estimate of the starts and stops of this machine to date is 15,000. This bearing is still in service and none of its parts has ever been replaced.

Following the above applications the Kingsbury thrust bearing began to be applied to vertical and horizontal hydroelectric units, to horizontal steam turbines and centrifugal pumps. During the war its use in these fields was greatly extended and it began to be employed to take propeller thrust. When our country entered the war the demand for turbine-driven ships advanced with a bound, which caused a similar increase in the demand for Kingsbury thrust bearings both for the turbines and for taking the propeller thrust.

The development of the Kingsbury thrust bearing has now reached such a stage that it is being used in steam turbines to take the whole steam thrust, no dummies whatever being required. One turbine thus equipped runs at 3600 r.p.m., the mean surface speed in the thrust bearing being 155 ft. per sec. This is the highest speed attained thus far, but there is no reason to believe it cannot be greatly exceeded. High surface speed is not always accompanied by high angular velocity. Tests are now being made that show the bearings will operate successfully at 15,000 r.p.m.

For *constant* low-speed operation the best operating example is the plate-glass-machine bearing described above, whose mean surface speed is 2.1 ft. per sec. Much lower speeds occur when the machine slows down to a stop. A mean operating surface speed of 2.1 ft. per sec. is not low for a heavy oil, however, even with a unit load of 1000 lb. per sq. in.

Hydroelectric units ordinarily run on light engine oils and the film thicknesses are, therefore, much less at any speed and load than would be the case if heavy oils were used. They have to start and stop under practically full thrust load, consequently that service may be considered as the most severe for thrust bearings. When one of these units slows down it passes gradually through the whole range of speeds from normal to the very low speed at which the oil film breaks in the thrust bearing. All this time the friction coefficient, and hence the torque required to turn the rotor, is reducing. When the film breaks the friction coefficient increases and the rotor is brought to rest.

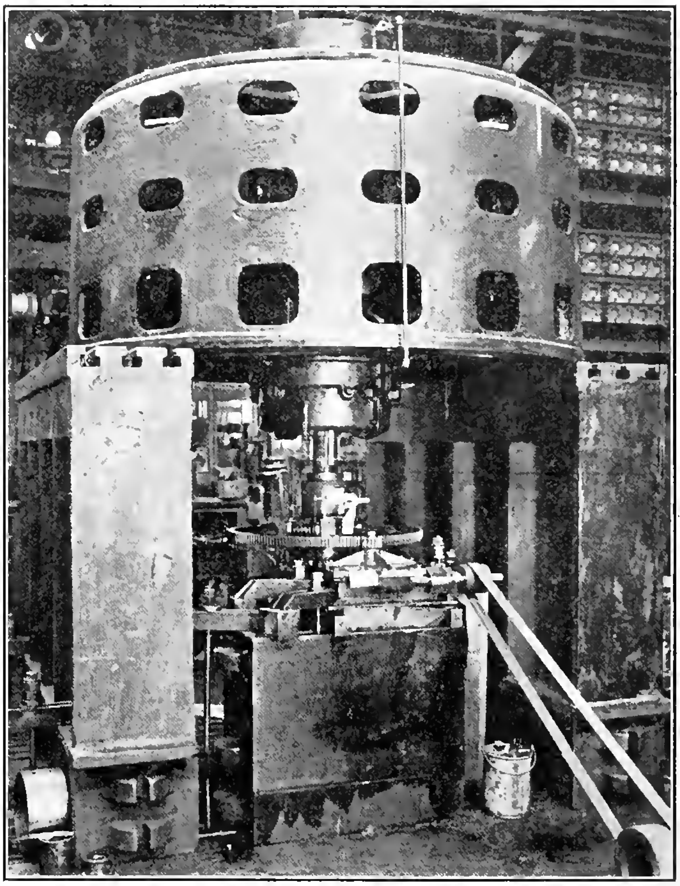

Fig. 1 View of Machine Employed in Testing Thrust Bearings at Slow Speeds

Consideration of these severe service conditions suggests the following questions: At what surface speed does the film break? What happens to the bearing if it continues to turn after the film breaks? Does the film break suddenly? These questions are of great importance. The slow-speed tests described later were made for the express purpose of answering them. An effort will be made

[1] Gen. Mgr. and Ch. Eng., Albert Kingsbury, Eng. Mem. Am. Soc. M. E.

Presented at the Annual Meeting, December 2 to 5, 1919, of The American Society of Mechanical Engineers. The paper is here printed in abstract form. Copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

to cover the field between film lubrication and so-called metallic friction.

It is known that, in a given bearing carrying a known load, the film thickness at a given speed is greater for a heavy oil than for a light one. Hence a heavy oil will sustain a given load at a lower speed than will a light oil. It may be assumed that the oil film breaks when it gets so thin that the high spots begin to rub. If the bearing surfaces are poorly fitted the film will break at a

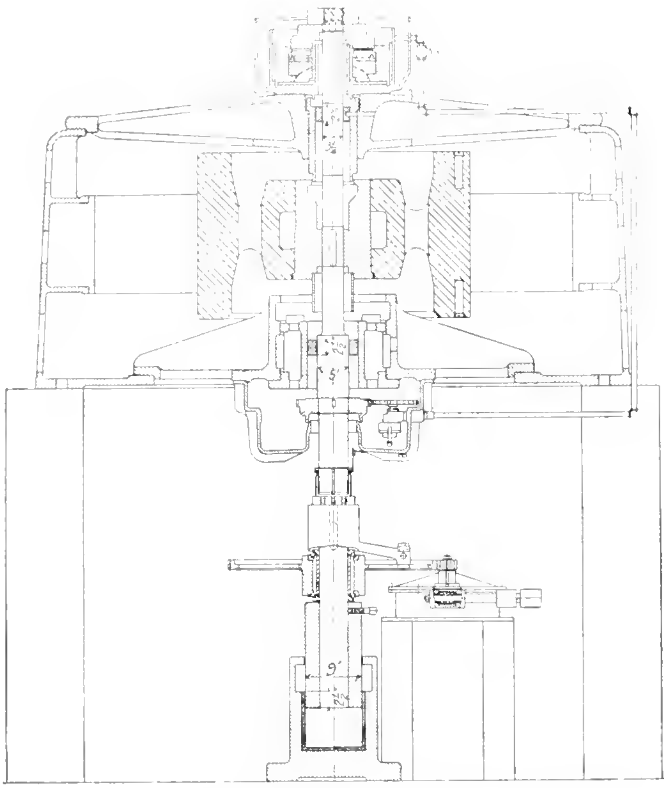

FIG. 2 VERTICAL SECTION OF THRUST-BEARING TESTING MACHINE SHOWN IN FIG. 1

higher speed than otherwise. When it is said that high spots rub on each other it is not meant that the metals come into contact with no oil between them. If the high spots are wet with oil, oil will persist in remaining between them. The local pressure may be enough to cause the softer of the two spots to be "ironed off" or crowded back out of the way. If the high spots are not of great magnitude the local heating will not be sufficient to make trouble and as soon as the high spots rub they will pass and cool. The softer high spot will recede on cooling and may even fall below the general surface. If the harder surface be perfectly flat it might iron off the soft high spots and make the soft face also flat. If the harder face is not perfectly flat the softer face will gradually conform to it as far as possible.

The machine used for the slow-speed tests to be described is shown in Figs. 1 to 4, inclusive. Power from a variable-speed motor is belted and geared down so as to produce constantly any desired low speed at the driving gear A which is mounted on ball bearings around the rotor shaft B, Fig. 3. A hub C is keyed to the shaft as shown in Fig. 4. It has arms D and E while the gear arm has a lug F. Between lug F and arm D are mounted two compression springs in a holder that is so arranged as not to bind when the springs are compressed. Angular movement between the hub and gear, by means of a suitable linkage, causes a corresponding axial motion of the ring-shaped indicator G that surrounds the shaft as Fig. 3. A fixed scale H is fastened to the machine frame. This can be graduated so that torque can be read directly. Since the load is constant the friction coefficient can be read directly on the scale if desired.

It will be noted in the section shown in Fig. 4 that two sprin[illegible] are used, a light one and a heavy one. When the driving [illegible] started its arm lug F moves and begins to compress the springs. The light one compresses first and then the heavy one also comes into action. When the compression of both becomes great enough, rotation begins and the springs expand as the coefficient of friction reduces from its starting values to its running value. The coefficient of running friction is so very low for a continuous film that the light spring will be compressed but little.

The following action was noted when the tests were begun: If the speed of rotation of the driving gear was not high enough to keep the shaft going fast enough to maintain a perfect film in the thrust bearing the high spots would rub and the coefficient increase, causing the shaft to stop turning. Then as the stiff spring compressed, the driving torque would become great enough to start the shaft turning again. Once the starting resistance was overcome

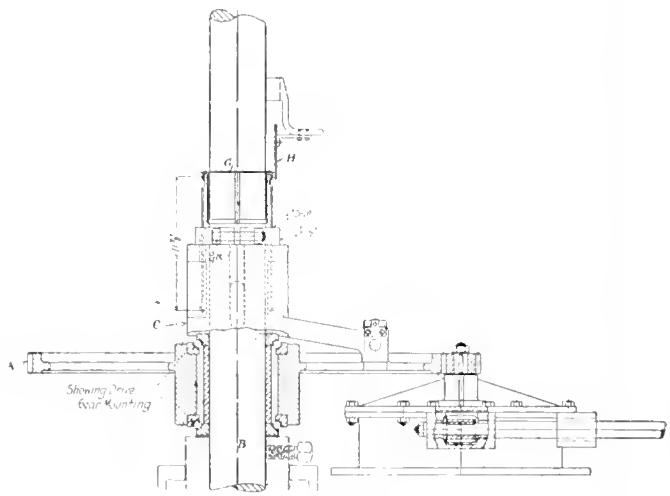

FIG. 3 DETAILS OF DRIVE-GEAR MOUNTING OF TESTING MACHINE SHOWN IN FIG. 2

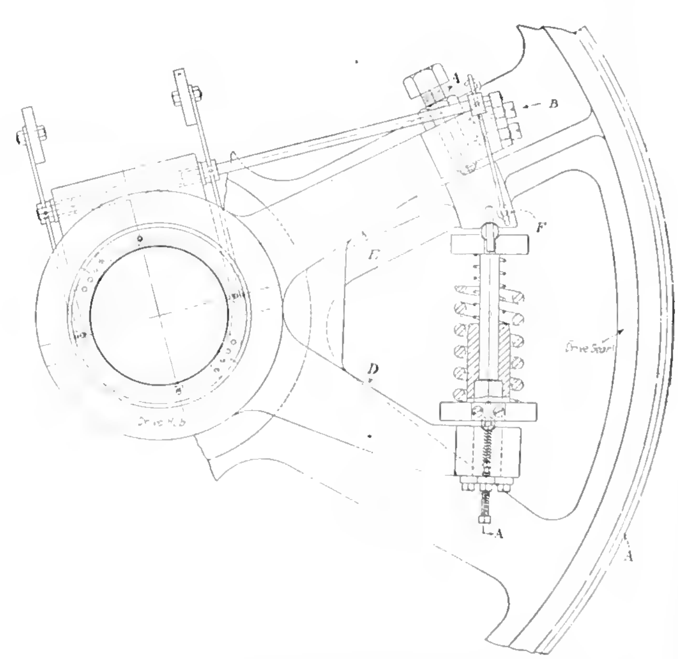

FIG. 4 PORTION OF DRIVE GEAR, SHOWING METHOD OF MOUNTING THE COMPRESSION SPRINGS

t[illegible] [illegible]ld be accelerated by the expansion of the stiff spring [illegible] up sufficiently to be driven by the light spring. [illegible] [illegible]ar would not be turning fast enough to keep [illegible] [illegible]ould then slow down till the film broke [illegible] would take place about every two seconds. [illegible] 10,000 lb. The thrust bearing has four shoes of

the form shown in Fig. 5, their total area being 76 sq. in. Hence the initial tests were run with a unit pressure of (10,000/76 =) 132 lb. per sq in., the intention being to decrease the area later to 38 sq. in. by taking out two shoes; then still more by reducing the total area of the remaining shoes to 19.53 sq. in., 13.33 sq. in., 10 sq. in., and finally to 5 sq. in.

Before making the tests the thrust bearing, which is shown in section by Fig. 6, was carefully inspected. The face of the cast-iron collar was in excellent condition, i.e., smooth and flat. The babbitt-faced shoes were then fitted to the collar face under load. This fitting process developed some interesting features. Not knowing at how low a speed the machine would run and have a perfect film, it was assumed that the high spots would rub at 2.8 r.p.m. The machine was run at this speed for 30 min. The friction was so high that the load came on the heavy spring. The shoes were then removed and the high spots scraped down slightly. The shoes were then put back and the bearing run at 2.9 r.p.m. for 15 min. They were then removed and scraped again, and run at 3 r.p.m. After the starting friction was overcome the load was carried on the light spring and the speed kept constant for 45 min. The spring compression gradually reduced from 9/16 to 3/8 in., showing that the friction was decreasing rapidly. This indicated that such high spots as interfered with each other at this speed were gradually being rubbed down. The results of this first test are plotted in Fig. 7. The shoes were inspected after this run and found to be in excellent condition.

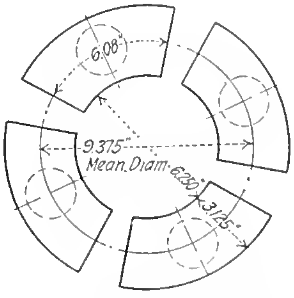

Fig. 5 Arrangement of Shoes in the Thrust Bearing Tested

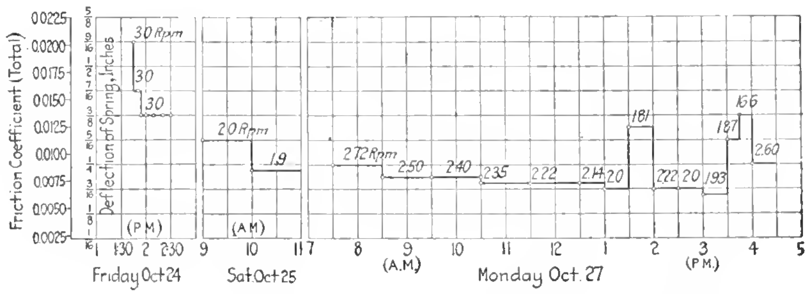

Figs. 7 to 9 Results of Tests of Thrust Bearing

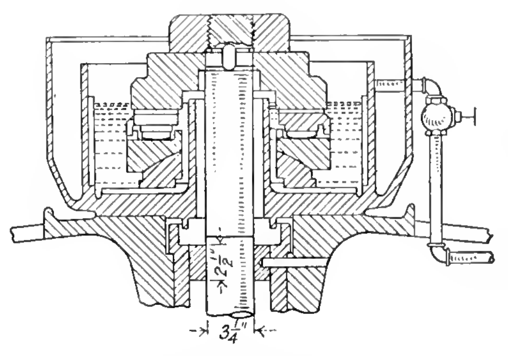

Fig. 6 Section through Thrust Bearing Employed in the Tests

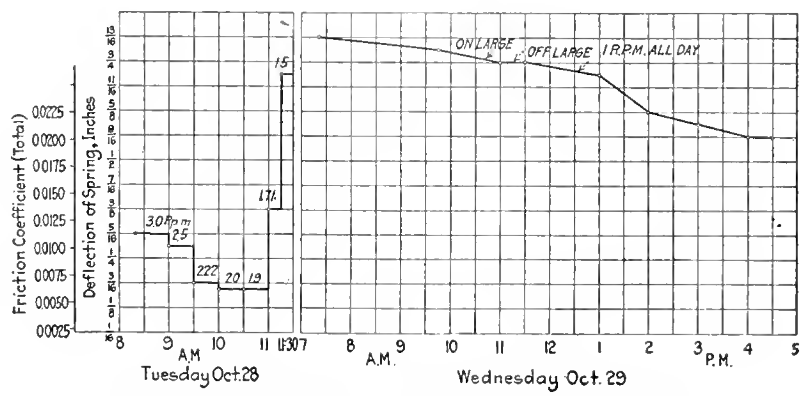

Figs. 10 and 11 Results of Tests of Thrust Bearing

The next test was run on Saturday, October 25, beginning with 2.86 r.p.m. The speed was then reduced to 2 r.p.m. (see Fig. 8) and the spring compression decreased to 5/16 in. It was expected that the compression would decrease with the speed so long as a good film was maintained. The machine was then run for an hour at 1.9 r.p.m., and the light-spring compression was 15/64 in., showing that the friction coefficient still continued to reduce. This run had to be stopped on account of quitting time.

Tests were continued on Monday, October 27, starting with 2.72 r.p.m. (see Fig. 9). The first run showed that the friction decreased until the speed was 2 r.p.m. When an attempt was made to run at 1.81 r.p.m., the friction increased considerably — about 100 per cent. It will be noted that with a speed as low as 1.66 r.p.m. the light spring still carried the load easily.

The results of Tuesday's tests correspond very closely with the previous ones (see Fig. 10). The speed was lowered at intervals until it reached 1.9 r.p.m., the friction coefficient likewise decreasing. When an attempt was made to run at 1.71 r.p.m., the spring compression increased more than 100 per cent. At 1.5 r.p.m. it increased to almost double its value at 1.71 r.p.m.

After the run on Tuesday the thrust bearing was inspected. It was found to be in excellent condition, the shoe faces having apparently worked in so as to be a much better fit to the collar. In view of this improvement it was decided to see what would happen if the machine were run constantly at 1 r.p.m. (see Fig. 11). At the beginning of the run the heavy spring was slightly compressed. At the end of four hours the load was beginning to be carried by the light spring alone. At the end of another four hours the compression of the light spring had reduced considerably, finally reaching 9/16 in. This compression remained constant for 30 min. As there was an evident improvement in the bearing surfaces, shown by the gradual reduction of the friction coefficient, it was decided to run the next day at various speeds and see whether the coefficient would reduce with the speed to a lower point than before.

On Thursday the machine was started up and run for 15-min. intervals at each speed beginning with 2.25 r.p.m. The minimum friction was obtained at 2 r.p.m. The coefficient remained constant, however, until the speed reached 1.71 r.p.m. It increased appreciably when the speed was reduced to 1.66 r.p.m. and continued to increase, though slowly, until the speed reached 1.5 r.p.m. The friction then remained constant until the speed was reduced to 1.39 r.p.m. At this point the machine was shut down.

It is evident from the foregoing that by running continuously at 1 r.p.m. the bearing surfaces improved so that the friction coefficients at speeds slightly above 1 r.p.m were less than they otherwise would have been.

The Hvid Engine and the Fuel Problem

By E. B. Blakely,[1] Chicago, Ill.

This paper describes a type of engine, the Hvid, which it is claimed has all the advantages and none of the disadvantages of the so-called Diesel type, and which is being produced in units as small as 1½ hp. It can be started cold, has no complicated air-compressor systems, and is so economical that it can compete with gasoline engines of the same size. The author outlines the operation of the engine, describing in detail the suction, compression, power and exhaust strokes and presenting a series of indicator cards. Fuel consumption is shown by means of curves obtained as the results of tests performed. The paper concludes with a discussion of the heat balance and torque characteristics of the engine.

It has been estimated that there are in use now in this country, burning gasoline, nearly 4,000,000 automobiles, 250,000 trucks, 500,000 motor boats, 75,000 tractors and 750,000 farm engines. Is it any wonder, therefore, that the demand for gasoline has increased?

The visible supply of crude oil is naturally diminishing and since the oil is becoming heavier all the time, the percentage of gasoline yield, now averaging 15 per cent, is lessening.

The supply of gasoline may be increased slightly by making use of the cracking processes, which would necessitate an increased cost of production, and also by blending high-test casing-head gasoline with kerosene, a process bound to be short-lived because our gas wells are rapidly giving out. It may also be conserved by increasing the thermal efficiency of the engines and by adapting them to burn kerosene and mixtures of gasoline and kerosene. The relief gained, however, would be but temporary at best. We are having trouble enough now in burning properly the present-day gasoline without trying to burn all sorts of mixtures which at the least would necessitate constant changing of carbureting adjustments and methods.

Much has been written and said during the past two or three years on the subject of using kerosene as fuel in conventional gasoline engines of both the slow- and high-speed types, and while undoubtedly much has been learned concerning the characteristics of kerosene under certain conditions, the burning of kerosene in gasoline engines, so far as the writer knows, has not been accomplished with complete success up to the present time. By complete success the writer means starting the engine on kerosene in atmospheric temperatures approximating 0 deg. fahr. and below (for these must be reckoned with) without preliminary heating of any sort and burning the kerosene so as to eliminate troublesome carbonization and complicated and unsightly apparatus, and obtain high economy.

In attempting to burn kerosene in modified gasoline engines we are confronted by the following basic difficulties: Kerosene and gasoline are chemically widely different substances, having nothing in common but the base from which they are derived. Their initial boiling points are wide apart, that of commercial gasoline being about 100 deg. fahr., while that of kerosene is about 330 deg. fahr. Their boiling ranges are also totally different, that of gasoline being 340 deg. fahr., while that of kerosene is about 200 deg. fahr. Gasoline-air mixtures will ignite spontaneously at approximately 680 deg. fahr. while similar mixtures of kerosene and air self-ignite at approximately 575 deg. fahr. Mixtures of gasoline and air form a permanent fixed gas, but mixtures of kerosene and air do not. Under these conditions a jet carburetor designed for vaporizing gasoline cannot be expected to vaporize kerosene. The best it can do is to atomize it.

In order to vaporize, as well as to prevent precipitation or condensation of the atomized kerosene in the combustion chamber it is necessary to heat the charge, and since the power output of the engine depends upon the amount of oxygen taken in and burned during each cycle, it is clear that the more the charge is heated the less oxygen we can get into the cylinder and the less power we can obtain. This forces us to a compromise between two conflicting conditions, the maintenance of the incoming charge at the lowest possible temperature which will vaporize the kerosene and the prevention of precipitation in the combustion chamber. This compromise might be satisfactorily effected in the case of an engine running at a constant speed and load, but in the case of an engine running at varying speeds and loads it is a very different compromise to make, because as the power demands on the engine vary, so must the total amount of heat added to the charge vary.

In order to obtain maximum power from any internal-combustion engine, regardless of the kind of fuel used, we must have maximum mean effective pressure, and since mean effective pressure depends largely upon compression pressure, we must use the highest compression pressure possible. This brings us again to a conflicting pair of conditions, because in order to prevent so-called preignition with its attendant disagreeable and harmful pounding, when burning kerosene, we are forced to use a relatively low compression pressure which lowers the mean effective pressure and also the power output.

In this connection may also be mentioned the so-called preignition knock which occurs when using too high a compression pressure with kerosene. This knock is not caused by preignition, as is generally supposed, but by small detonations after ignition has occurred and the piston has started downward. These detonations are due to the fact that kerosene is of a very complex chemical make-up and that after ignition has started the conditions are most favorable to cracking it. Under these conditions the kerosene breaks down into simpler combinations, some of which are highly detonating, others less so, and these compounds set one another off successively, according to their stability, but so rapidly as to produce a single knock.

Many engineers believe that if the problem of utilizing kerosene for fuel in these engines now burning gasoline could be solved, the whole fuel problem would be solved. It undoubtedly would help the situation immeasurably, but the true economic solution of the fuel problem lies not in trying to adapt some particular fraction of the distillation of crude oil to the engine, but in adapting the engine to the available fuel, whether it be crude oil just as it comes out of the ground, or some by-product of its distillation.

There have been numerous engines built in the last ten years, capable of running consistently on the various crude and fuel oils, as for instance the Diesel and so-called semi-Diesel engines, hot-bulb and surface-ignition engines. These, however, have been used mainly in marine work and in relatively large units. It is out of the question to consider making Diesel engines of much less than 100 hp. per cylinder, because of the complicated fuel-injecting mechanism and the high cost of production. The other types have the disadvantage of requiring external preheating before they can be started, and the torches used for this purpose are a source of constant danger. Electric preheating has been tried, but with little success.

Advantages of the Hvid Engine

Th[illegible] an engine, however, which has all the advantages of th[illegible]tioned types and none of the disadvantages. This [illegible]. It can be started cold on any liquid fuel which [illegible]gh a pipe. It has no complicated air-compressor [illegible]njecting the fuel, no hot bulbs or torches and runs with [illegible]nomy on a par with the Diesel engine. The Hvid engine [illegible] and is being produced in units as small as 1½ hp., and so

economically as to be able to compete with gasoline engines of the same size. Briefly enumerated, its chief advantages are:

a Mechanical simplicity
b Low fuel consumption at all loads
c Ability to start and run on any oil which will flow
d Low water-jacket losses
e No lubricating difficulties
f Constant compression
g Remarkable torque characteristics
h Absence of all electrical devices, hot bulbs and torches for ignition purposes
i Absence of all carbureting mechanism
j No carbon troubles.

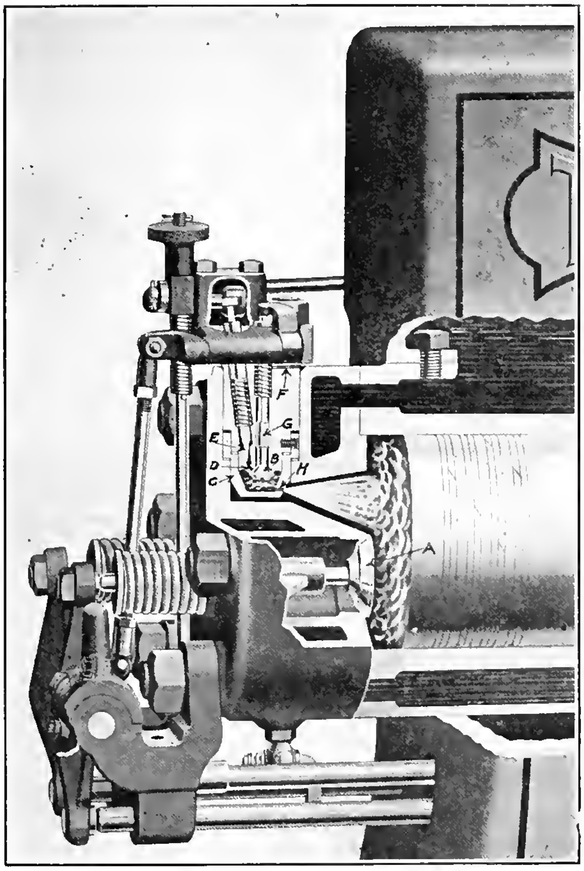

Fig. 1 Cutaway Section of 8-hp. Hvid-type Farm Engine

The Hvid engine is of conventional four-cycle type, embodying the usual inlet and exhaust valves, timed to open and close as in any four-cycle engine. The compression pressure is carried to between 425 and 475 lb. per sq. in., which heats the compressed air to between 900 and 1000 deg. fahr. In the cylinder head there is a fuel-admission valve terminating in a small steel cup by means of which a preliminary explosion is made to force the fuel into the combustion space. Referring to Fig. 1, the Hvid cycle is as follows:

Suction Stroke. During the suction stroke pure air is admitted to the cylinder through intake valve *A*. Fuel valve *B* is opened in synchronism with intake valve *A* and some fuel flows into cup *C* out of hole *D* which is uncovered by the opening of valve *B* (the fuel enters cup *C* partly by gravity and partly by inhalation). The amount of fuel admitted is controlled by the metering pin *E*, which in turn is controlled by the governor. At the same time that the fuel is being inhaled into the cup, a small amount of fresh air is also drawn through auxiliary air hole *F*, down past a fluted guide *G* into the cup *C*. At the end of the suction stroke, fuel valve *B* and air-intake valve *A* close, valve *B* sealing the fuel-admission hole *D*.

Compression Stroke. During this stroke all valves are closed and the air admitted to the cylinder on the suction stroke is compressed to about 420 lb. per sq. in., which raises its temperature to between 900 and 1000 deg. fahr. In other words, there is now a mass of highly heated air under high pressure in the combustion chamber and this rushes into cup *C* through small holes *H* near its bottom until the pressure in the cup is practically equal to the pressure in the combustion chamber. The conditions in the cup are now most favorable to "cracking" the oil, and as the oil cracks the lighter and more volatile components are detonated by the high temperature and the resultant high pressure within the cup forces the rest of the oil out into the air in the cylinder. The amount of fuel consumed in the cup per cycle is infinitesimal because there is only a very small amount of air present in the cup to support combustion.

Power Stroke. As the fuel in an atomized and vaporous state comes into contact with the heated air in the combustion space, very rapid combustion takes place and the pressure arising from it drives the piston.

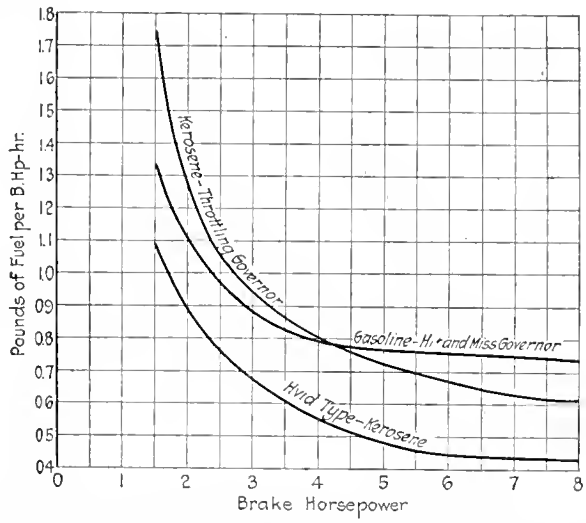

Fig. 2 Comparative Fuel-Consumption Curves of $5\frac{3}{4} \times 9$-in. Farm-Type Engines Operating on Different Principles

Exhaust Stroke. As in any four-cycle engine, the exhaust valve opens and the products of combustion are forced out by the piston.

Fuel Consumption

The fuel consumption of small Hvid-type engines is very good, being in general on a par with Diesel engines of large size. If

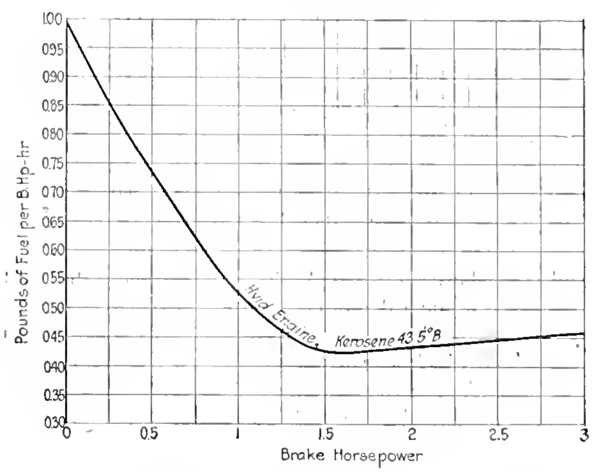

Fig. 3 Fuel-Consumption Curve of a $3 \times 4\frac{1}{2}$-in. Hvid Engine

Diesel engines could be economically constructed in units as small as Hvid engines can, it is doubtful whether they would compare at all favorably in thermal efficiency with the small Hvid units on account of the mechanical inefficiency of the air compressors

necessary to inject the fuel. In the comparative fuel-consumption curves shown in Fig. 2 the fuel economy of the Hvid engine as compared with two other types of the same size stands out very plainly, particularly at the lower fractional loads. The engine used in each case was $5\frac{3}{4}$ in. by 9 in., running 450 r.p.m., rated hp., 8.

The fuel-consumption curve of the small 3-in. by $4\frac{1}{2}$-in. Hvid engine shown in Fig. 3 is particularly interesting because this engine, running at 1100 r.p.m. normally, is the first relatively high-speed engine of this type built. Owing to the high speed, it was natural to suppose that trouble would be encountered with the time element necessary for the introduction of fuel into and ejection out of the cup; but it was found that this little engine could be run at speeds as high as 1500 r.p.m. without any apparent interference with the perfect operation of the Hvid principle.

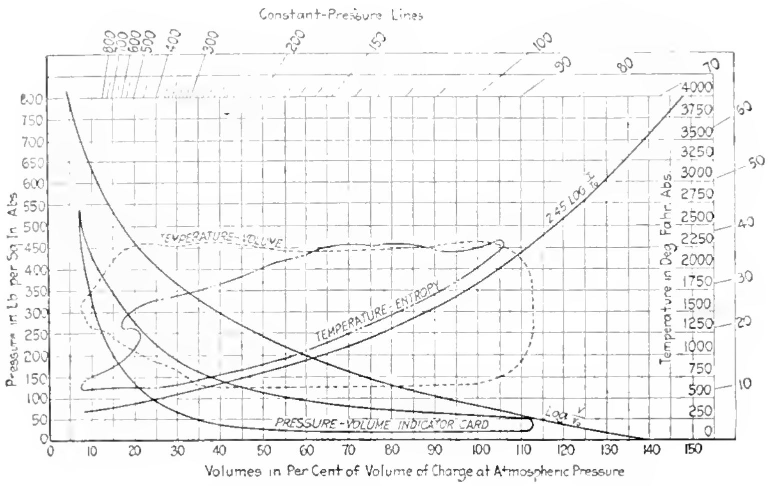

FIG. 4 VOLUME-TEMPERATURE DIAGRAM FOR A $5\frac{3}{4} \times$ 9-IN. SINGLE-CYLINDER HVID KEROSENE ENGINE

Entropy Diagram. The entropy diagram, shown in Fig. 4, was plotted from a pressure-volume indicator card taken from a $5\frac{3}{4}$-in. by 9-in. single-cylinder Hvid-type engine running at 450 r.p.m. and using kerosene as fuel. This diagram is submitted because it shows the general temperature characteristics, which are quite different from those in an explosive gasoline engine. It is interesting to note the low maximum temperatures, 2300 deg. fahr. abs., as compared with the maximum temperatures for gasoline engines, which frequently run as high as 3000 to 3500 deg. fahr. abs., and also, the sustained temperature in the Hvid engine throughout the working or expansion stroke. At first glance it might be argued that this sustained temperature would be harmful because of undue heat losses to the water jackets, but since the water-jacket losses are low and the thermal efficiency of th engine is remarkably good, the writer believes that combusti the Hvid engines takes place in the form of zone burning and the cylinder walls are more or less insulated from the high temperatures of combustion by a layer of air which is not burnt until near the end of the stroke.

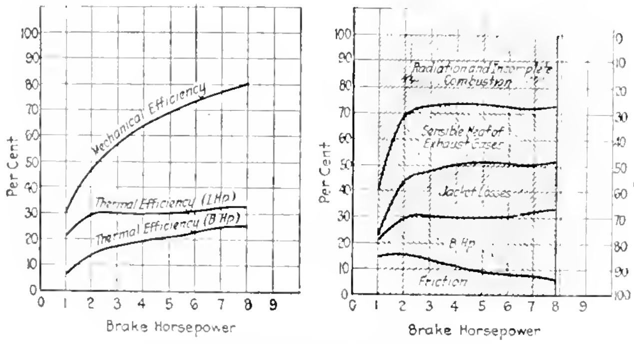

FIG. 5 HEAT BALANCE AND EFFICIENCY CURVES FOR $5\frac{3}{4} \times$ 9-IN. SINGLE-CYLINDER HVID ENGINE

Heat Balance. This test gives the mechanical efficiency and the thermal efficiency for both brake and indicated horsepower. The test was made upon a $5\frac{3}{4}$-in. by 9-in. single-cylinder Hvid engine which was flexibly connected to a Sprague electric cradle dynamometer by means of two "Spicer" universal joints. The engine was operated under various loads and speeds with various adjustments of fuel supply, compression and cup design. The final setting was made with a compression of 390 lb. per sq. in.

Test runs, curves for which are shown in Fig. 5, were conducted at various loads from a maximum to about one-eighth of maximum load, and readings were taken to determine the following:

1 Friction horsepower (electric dynamometer method)
2 Brake horsepower (torque and speed)
3 Jacket-water loss
4 Sensible heating in the exhaust (calorimeter method)
5 Loss due to radiation and incomplete combustion (by difference)
6 Fuel consumption (lb. per hour).

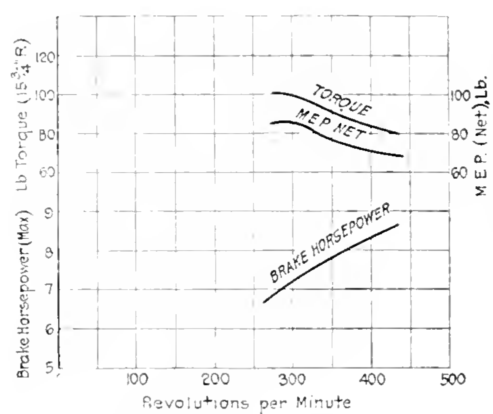

FIG. 6 BRAKE-HORSEPOWER AND TORQUE CURVES FOR A $5\frac{3}{4} \times$ 9-IN. SINGLE-CYLINDER HVID ENGINE

Items 1 and 2 are determined directly from dynamometer reading; items 3 and 4 are calculated from observed temperatures and weights; item 5 is determined by difference; and item 6 is obtained from direct measurements. The heat value of the fuel expressed in B.t.u. per lb. of kerosene is calculated from the following accepted formula: B.t.u. = 18,440 × 40 (deg. Baumé — 10) = 19,740 for the quality of fuel used in the test runs.

Torque. In Fig. 6 are shown some of the torque characteristics of the Hvid engine. When a gasoline engine of conventional design is overloaded so that the speed drops beyond a certain point its torque drops rapidly, because a certain velocity of air must be maintained through the carburetor to pick up and vaporize the fuel and carry it into the cylinder, but in a Hvid engine, since the introduction of fuel into the cup and into the cylinder is not dependent upon the velocity of the air taken in, as the speed drops, due to overload, more fuel is admitted than at normal speed, because the time element for the introduction of fuel is lengthened and the engine consequently shows remarkable "hanging on" characteristics.

Under these conditions it is very wasteful of fuel without a doubt, but there are certain conditions where this "bull dog" characteristi is desirable, even though it may be at the expense of fuel eco

on, the writer would say that while the Hvid engine s reached its ultimate state of development, it ssesses a number of wonderful characteristics which ract many internal-combustion engineers by the possi they hold out of helping to solve some of our fuel problems.

A New Type of Hydraulic-Turbine Runner

By FORREST NAGLER,[1] MILWAUKEE, WIS.

This paper is in the nature of a preliminary announcement describing the development of a new type of water-wheel runner which, on account of its greater speed and lower cost, is expected to largely supplant the well-known mixed-flow reaction (Francis) types of runners under low-head conditions. In order to provide a simple criterion of progress, but particularly to afford a more ready means of contrasting previous practice with the development described, the first part of the paper is devoted to an explanation of the term "characteristic speed" and its applications. This explanation, while in the nature of a repetition of much more extensive articles previously written, is thought to be desirable by reason of its peculiar adaptability to water-wheel analysis, and because it is not in as common use among engineers in general as it might be. A brief history of water-wheel development is likewise given, based on a consideration of characteristic speeds attained by successive types and during different periods of development. This history is brought up to date and includes the origin and development of the new type of runner. Finally a brief statement of the advantages and field of application of the new type is given, showing that by its use it is possible to build satisfactory machinery for heads down to one-half those previously found to be the limit, and for present head limits to go to over double the capacity of units previously used.

THE history of water-wheel development is practically covered by the developments of the last twenty or thirty years. This means that it has gone hand in hand with electrical development, which alone has made possible the utilization of large capacity units and high speeds. In the matter of speed, electrical-generator development has permitted of higher limits of r.p.m. than water-wheel designers have been able to reach under low- or medium-head and large-capacity conditions. On this account and because the limit of efficiency has long been so nearly reached, the greatest endeavors of runner designers have been directed toward increasing speed, and, as has been the case more or less with all lines of design, loyalty to precedent has largely interfered with any radical departures that might make for most rapid progress.

To permit of comparison between any two runners, or between the runners of any two periods of time, some common ground is necessary, some characteristic that can be expressed preferably in a single figure. Such a figure is available in what will be hereafter designated as *characteristic speed*. Because of its peculiar value in water-power work, though at the risk of repetition of more extensive articles already written, the original meaning and use of this term will be outlined briefly and explained by example.

To compare two water-wheel runners operating under different heads, developing different horsepowers, and running at different speeds, the first step would logically be to compute their power and speed performance under the same head. To do so, however, would leave varying horsepower, speed, and diameter, and so the second step would be one of the following:

A Recompute and compare their powers on the basis of their being so changed in dimensions as to have the same speed

B Recompute and compare their speeds on the basis of the same power.

Either method would give a positive indication of character expressed by a single figure. Basis *A* would give a *characteristic power* which serves to give the desired absolute basis of comparison, though on an exaggerated scale. This basis is used by Professor Zowski in *Engineering Record* of December 26, 1914, and as that article presents the most recently published data on high-speed runner development, comparisons given in the following paragraphs will be made on the same basis, making use of the same scales.

In general practice the speed comparison or *B* basis is made, and to make universal comparison possible the common head basis is taken as 1 ft. and the common power basis as 1 hp. Professor Zowski used a common speed of 50 r.p.m. in place of unity as that value is about the average unit speed of runners built for the Holyoke test and hence incurs the least recomputation or readjustment of mental conception as to size. The speed in r.p.m. resulting from such recomputation is the characteristic speed and is the characteristic which is used generally in hydraulic-turbine practice. This characteristic may be defined as follows:

> The characteristic speed of a runner is the speed in r.p.m which a model of that runner would have if operated under a head of 1 ft., this model to be reduced proportionally in all dimensions from the original until it will develop 1 hp. under 1 ft. head.

As an illustration of the universal application of the basis of comparison, Table 1 is given, which contains examples from actual installations; even figures, however, being used througbout. The final figure in each column is a direct indication of the character of the runner and comparison of these figures shows the relative speeds of the various types under any given condition of head and power. The universal application of this characteristic speed is evidenced by the fact that by its means the performance of any extremes of type may be compared. For example, an overshot wheel is shown to have about one-tenth the speed of the Fourneyron wheel, which was one of the types that superseded it. Similarly, modern wheels may attain from three to eight times the speed of the Fourneyron, and for that reason they have in turn displaced it.

TABLE 1 COMPARISON OF OLD- AND MODERN-TYPE HYDRAULIC TURBINES

Item	Old Types		Modern Types			
	Overshot Wheel	Fourneyron (Tremont) (Turbine)	Nagler: High Speed Low Head	Usual Mixed-Flow or Francis: Medium Speed	Usual Mixed-Flow or Francis: Low Speed Dbl. Run	Impulse (Pelton): Twin
Head in feet	14	14	14	200	400	2,000
Horsepower, total	50	180	500	40,000	20,000	20,000
Runner horsepower	50	180	500	40,000	10,000	10,000
Speed, r.p.m.	10	53	200	150	360	375
Runner diam., in.	144	40	72	130	72	96
Unit horsepower	0.95	3.44	9 55	14.14	1.25	0.11
Unit speed, r.p.m.	2.67	14.16	53.50	10.61	18	8.39
Characteristic diam., in.	148[1]	21.50	23.30	34 70	64.60	290
Characteristic speed, r p.m.	2 66	26.30	165	40	20	2.78

[1] Physically an impossibility under 1 ft. head as the diameter of an overshot wheel is fixed by the head and not by power or speed. Similarly the value of column 6, while not so positively a physical impossibility, is practically so.

To obtain the corresponding figure or characteristic speed in the metric system multiply by 4.46, which allows for the slight difference in metric horsepower and for head expressed in meters rather than in feet.

The last three columns of Table 1 are indicative of the field which exists for medium- or low-speed runners. They cover head conditions where mechanical features of strength, or hydraulic conditions governing wear, limit the desirability of attaining high speed. For example, for the conditions of column 4, higher speed is readily obtainable from the runner end and is very desirable from the standpoint of generator design. The medium-speed type of runner is used from considerations of life and strength of the runner, both of which would be decreased at higher speed according to the present state of the art. Similarly, the conditions of columns 5 and 6 are best met by low-speed types, the limiting feature

Presented at the Annual Meeting, New York, December 2 to 5, 1919, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. The paper is here printed in abstract form. Copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

being generator speed, although runner design would readily permit higher limits. Hereafter in this paper comments on application will be confined to the high-speed, low-head type of runner, primarily applicable to heads under 100 ft.

Historical

Historically, the progress in hydraulic-turbine building may be excellently illustrated by noting the increases in characteristic speed that have been effected. The earliest types of water wheels were the current wheels of the flat-paddle type, used for irrigation, of which there are records antedating the Christian era.[1] These developed into the various forms of overshot, undershot, and breast wheels prevalent during the first half of the nineteenth century, very infrequently reaching a capacity of 100 hp. Their characteristic speed varied up to a maximum of possibly 3, and, as a consequence of their application to such small heads, their r.p.m. was very low, averaging probably under 20.

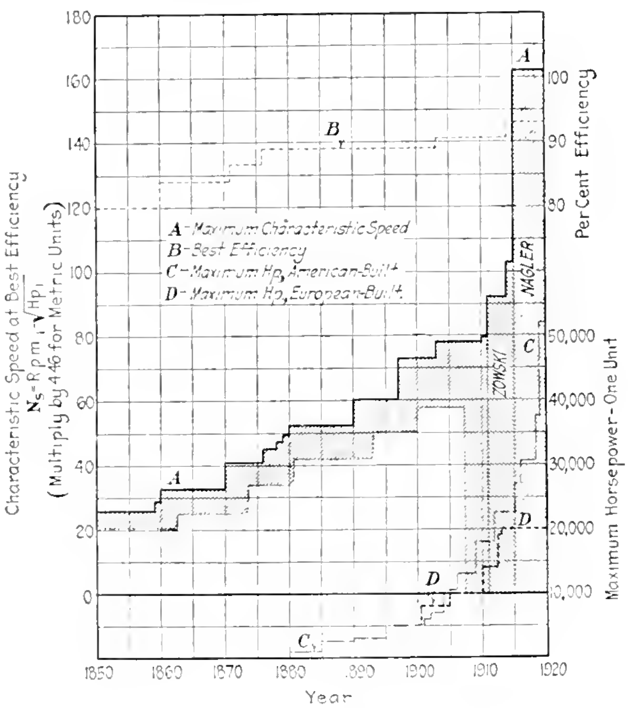

FIG. 1 GRAPHICAL REPRESENTATION OF THE DEVELOPMENT OF THE HYDRAULIC TURBINE

Lack of necessity for capacities beyond what could be absorbed by a millstone or saw and crudeness in power-transmitting machinery held capacities and speeds down to low limits. These limits began to be raised about 1825 and the turbine types of water wheel soon displaced their cumbersome predecessors. From about 1825 to 1840 two Frenchmen, Fourneyron and Jonval, developed two general types which were the forerunners of the turbine as it is known today. These are respectively the radial (outward)-flow and axial-flow types, and are still known by the names of their originators, both of whom, according to records, had exceptional knowledge of hydraulics. These types of wheels were developed both in Europe and America with efficiencies exceeding 80 per cent, but demands for speed and capacity were such as to limit specific speeds to between 20 and 40 and capacities to considerably under 1000 hp.

The next radical step is found in our present form of mixed-flow turbine, which resulted from successively increasing the capacity of the radial-inward-flow type of turbine until the buckets or vanes received the water radially and discharged it axially. This is the type of runner used for low-head work up to the present time, it being designated originally under various trade names such as Hercules, Sampson, Success, New American, and by the names of various designers. More generally it has been known as the reaction or Francis type, though strictly the latter name may not be applied to the mixed-flow runner as appropriately as to the pure radial-inward-flow type which Francis brought to a high state of perfection around 1870.

The mixed-flow runner which has been used in developing probably well over 90 per cent of all the water power produced in the world from medium to low heads has had most of its development and reached its highest state of perfection in America. This statement is based on the fact that record performances in size, efficiency, capacity, and head of hydraulic turbines have been made and held in America throughout the greater part of the period covering modern turbine development.

Fig. 1 has been prepared to illustrate graphically the history of hydraulic-turbine development as outlined above. These curves embody the most authentic data available and, while there may be particular points not entered or not enveloped by the lines shown, their form would be affected to a negligible extent by their inclusion. Curve *B* illustrates the extent to which practical limits of efficiency have been reached. That most rapid progress has dated from the nineties is very strikingly brought out by curve *A* of characteristic speed and curve *C* of turbine capacity. Both of these criteria of improvement go hand in hand with electrical development. Curve *A* further indicates that characteristic speed was advancing by only moderate amounts, although its improvement had been steady for a considerable period. It is this curve which points out the radical nature of the increases effected by the new type of runner forming the subject-matter of this article, its characteristic speed exceeding previous records by over 50 per cent at the outset. The increases made by Zowski in 1911 and in 1914 when characteristic speeds of approximately 90 and 102, respectively, were attained, were the subject of the most widespread comment among engineers and were the basis of great advance in the design of low-head, direct-connected units.

Since the speed of a runner is directly proportional to its characteristic speed, inspection of Curve *A* will indicate that under any given conditions this new type of runner will permit of speeds over 50 per cent in excess of those possible heretofore. The effect of such an increase will be instantly apparent to any one who is familiar with the extensive efforts made to increase electrical gen-

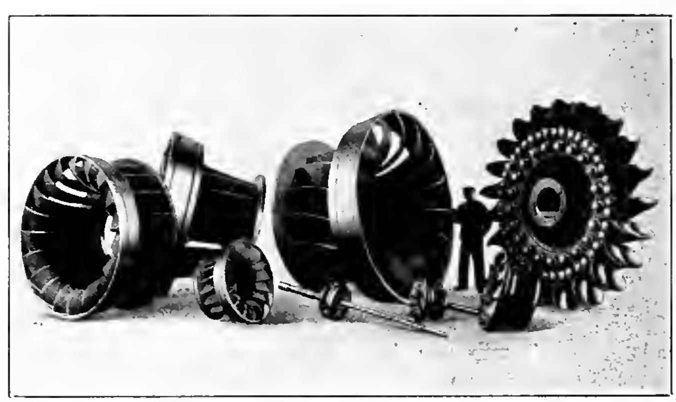

FIG. 2 TYPICAL GROUP OF MODERN MIXED-FLOW, REACTION (FRANCIS) RUNNERS CONTRASTED TO IMPULSE-TYPE WHEEL SHOWN ON THE RIGHT

These two types are the basis of practically all hydraulic-turbine development since about 1900, with the exception of the type of runner forming the subject-matter of the paper. Characteristic speeds are about 3 for the impulse wheel and from 25 to 95 for the reaction wheels.

between 50 and 60 revolutions per minute as contrasted to the 90 or 100 readily obtainable with the new type of development.

Development of the New Runner Type

In 1907 and 1908 the author was connected with some rather extensive field work, comprising erecting, experimentally improving and testing of some large-size axial-flow or screw pumps. This work concentrated all attention on a single type of hydraulic impeller for over a year, and it was only natural that impressions then formed should greatly influence his trend of thought in later work, which has been exclusively along hydraulic-turbine lines. At any event the effect was such that the accepted form of reaction (Francis) runner, illustrated typically in Fig. 2, then and still the basis of practically all low-head turbine design, seemed unnecessarily complicated and without logical justification from any hydraulic or mechanical standpoint. These ideas crystallized in 1913 when definite application of the axial-flow principle was shown as giving inherently less wetted surface, simpler passages and greater mechanical strength than the corresponding reaction runner having radial inlet and axial discharge.

To bring out the comparison most effectively the initial drawings showed the axial-flow runner sketched in on the outline of the reaction runner, using the same runner band and showing the additional advantage of being able to use either the usual radial inlet guide case or the straight axial case. Most, but not all, of subsequent commercial applications have been along the former lines, but, undoubtedly, the still greater simplicity effected by the latter, especially in horizontal settings, will bring it into prominence. Models were made with the least possible delay and theories checked

Fig. 3 One of the First Commercial Applications of the New "Suction" Type of Runner Designed in 1916[1]

[1] Two units were constructed for a rating of 100 hp., 8 ft. head, 225 r.p.m. At the left is shown a high-head Francis wheel having about one-eighth the characteristic speed of the new type of runner, the characteristic speed of the former being about 20.

out practically with actual runners. New lines of improvement naturally became evident during trials, but the original profiles were left fundamentally intact, with the result that the form of turbine runner shown in Fig. 3 was developed. Inspection of this figure reveals the fact that the entire design is based on a straight radial blade, which offers the absolute minimum of wetted surface and of bending moment on the root of the blade. It is by reason of these two fundamental advantages emphasized by the simplicity and inexpensiveness of the design that the author believes the new type of runner will supersede the mixed-flow or Francis type. Runners of practically the axial-flow type, but roughly conical in profile, may possess certain desirable features of strength or form of passage, but the measure of their advantage is largely indicated by the nearness with which they are found to approach the flat form.

Commercial installations of any considerable size were naturally approached with the greatest care, as it was difficult to anticipate what effects there might be due to the critical state of water resulting from the high velocities used. The initial small plants designed in 1916 operated without any difficulties with regulation such as might have been expected, nor did commercial operation show any noticeable difference from previous types.

Tests on models were verified by Holyoke tests in 1917, the initial design being used partly for commercial reasons and partly for historical purposes. Only one design of blade was tested, although two runners, one having three and the other four blades, were also given runs. A typical set of results of these initial tests will be found in Table 2 of the complete paper, and although they do not equal in efficiency later tests obtained on improved runners, the figures were nevertheless used in plotting some of the curves in Figs. 4 and 5. Comparisons are confined to speed and capacity

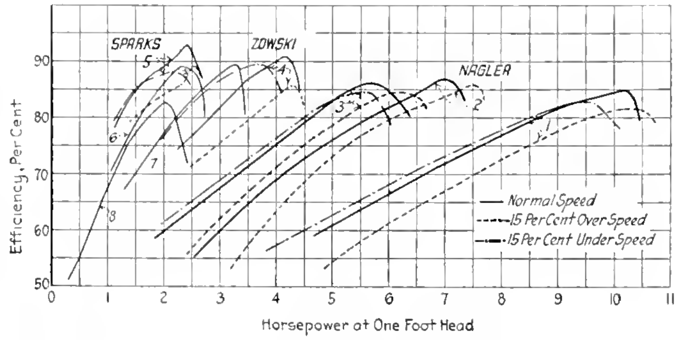

Fig. 4 Power-Efficiency Curves for Wheels Having a Normal Speed of 50 r.p.m.

for the purpose of this description and previous best results are accordingly also plotted in Figs. 4 and 5. The basis of these curves is taken directly from Professor Zowski's comparisons in *Engineering Record* of December 26, 1914, and it should be noted that they are plotted to show comparative powers on the basis of constant speed as outlined previously herein, although a common basis of 50 r.p.m rather than unity is used. This power basis exaggerates the comparison considerably over the characteristic-speed basis, but is retained to permit of direct reproduction of curves showing results typical of the state of runner development prior to the author's work.

Fig. 5 is a reproduction of the "equal efficiency" diagram of the December 26, 1914, *Engineering Record* article. The scale has been extended to permit of showing the relative location of the new point of best efficiency and the great flexibility inherent in the new form of runner. The diagram of runner No. 3 is shown at the right on repeated abscissæ in order to avoid too much overlap of diagram and consequent confusion. The ordinates remain the same. The shape of the "efficiency hills" is somewhat different from that of the mixed-flow runner, although perhaps not as much so as might be expected from the great difference in runner forms. That the guide cases (gates) were of the same design for both forms may be somewhat responsible for the runner not showing greater diversity in characteristics.

Fig. 5 presents an excellent basis for showing the contrasting speed characteristics of runners. Obviously their having been recomputed to 50 r.p.m. causes all the highest efficiency areas to lie on the same vertical line. This simplifies comparison in that the horizontal width of the equal-efficiency areas indicates flexibility of the runner or its ability to maintain good efficiency under varying speed or head, the latter being the variation encountered in commercial application. The position of the highest efficiency area on the vertical ordinate indicates whether it is of a high-capacity or low-capacity type or similarly whether it is a high- or low-speed runner. Its suitability for low-head work is determined largely by its vertical position.

Commercial Advantages

Up to date seventeen commercial runners of this type, varying from 80 to nearly 1000 hp. in capacity, have been built or are building for a total of nine plants. Nine of these have been tested out thoroughly in place with an actual showing of characteristic speeds often over 200 (in the metric system 900) under abnormal low-head conditions when synchronous speed was maintained during high water.

Numerous and sometimes unexpected advantages have been found to result from the simple and open form of runner. For example, a runner may be taken out and another substituted for

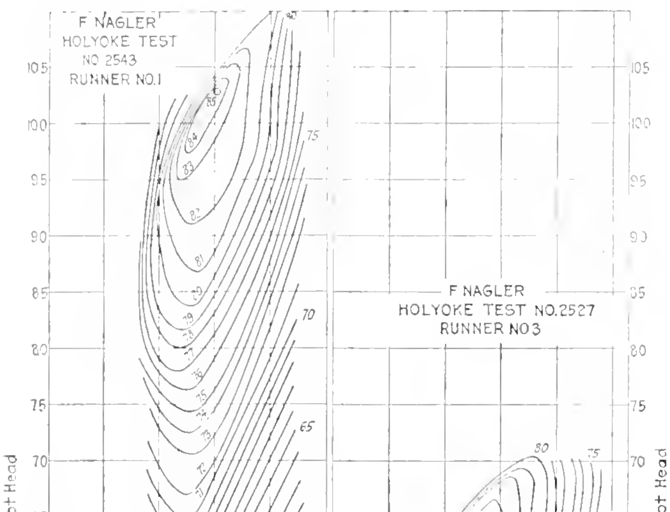

Fig. 5 Comparison of the Zowski and Nagler Tests

capacity variation under flood conditions or for test purposes without removing any other turbine parts except two or three guide vanes. In two plants this was made use of to install a high-capacity runner for obtaining more power during flood periods. Likewise these higher-capacity runners were made by using the original core boxes, which means that blade angles were unchanged, the result being accomplished simply by using a different number.

The greatest mechanical advantage arises from the fact that the runner cannot clog up with sticks, blocks, leaves, or other debris, a feature which the author's experience with the average low-head installation would indicate should result in several per cent more power the year around.

The primary advantages which were anticipated and which have proven out in practice are as follows:

a Lower generator cost due to an increased speed of 50 per cent and over above previous practice. This saving varies from 15 to 35 per cent of the generator cost, depending on its size and speed

b Lower turbine cost due to simpler runner. This averages around 10 per cent, the runner being about one-third the weight of the corresponding mixed-flow type and much easier to build, either solid or with separate blades

c Smaller generator diameter, which in turn means a smaller power house

d Higher generator efficiency due to better design possible with the higher speed. This is seldom less than 2 per cent gain and may conservatively be stated to vary from $1\frac{1}{2}$ to 3 per cent

e Greater turbine flexibility, which permits the plant to give more power under flood conditions when the head is greatly reduced. This runner has an overspeed of about 100 per cent as contrasted to perhaps 60 to 75 per cent for previous types. This means that its efficiency and consequently its power will not become zero until the head has been reduced to about one-quarter normal as contrasted to four-tenths or one-third normal for reaction types. This advantage lies not solely at the extreme limit of minimum head, but at all abnormal heads or speeds, as the efficiency is less affected than with the other types. (See Fig. 4, showing abnormal-speed curves.)

At the present time efficiencies equaling the records of reaction (Francis) wheels have not been reached, but they are being approached rapidly and with the inherent advantage of better generator efficiency, equivalent combined results for the unit are only a matter of short time. Fundamentally the axial-flow runner should give greater efficiency than the mixed-flow purely from considerations of wetted surface and hydraulic friction, to say nothing of the simpler form permitting of greater accuracy of construction and more correct design.

Type of Runner

As to the nature of this new type of runner, it may be said that from direction of flow it is undoubtedly a pure Jonval type, although his runner consisted of a narrow row of blades on the periphery of a comparatively large disk, and his characteristic speeds seldom exceeded 20 or 30 as contrasted to the present 100 to 200. Furthermore the Jonval type was a pure reaction wheel, which infers jets issuing from orifices or channels, these being noticeably lacking in the runners of Fig. 3.

Professor Baudisch in some of his mathematical studies on the design of high-speed axial-flow runners has introduced a type name which translated literally is "suction jet," the conclusions from his calculations being that in order to produce extraordinarily high characteristic speed it is essential to run into certain underpressure conditions such as result when velocities greater than $\sqrt{2gH}$ are produced in the throat of a diffusing nozzle discharging under a head of H feet. The term "suction turbine" impresses the writer as being quite appropriate, but from another reason which may be outlined as follows: Underpressure is not essential to high characteristic speed, though it may frequently occur. The primary essential to high characteristic speed (125 to 200) is a reduction of hydraulic friction and harmful centrifugal forces. Neglecting friction and possibly blade thickness, there are no mathematical or hydraulic laws that will prevent doubling or quadrupling any particular characteristic speed by simply flattening the blade angles. A direct analogy to this is the well-known illustration of relative velocities evidenced in the sail of an ice boat. The practical effect of so doing with a given profile is to lengthen the blade so that the friction on the increased wetted surface reduces efficiency and speed or results in constriction of passage. In the author's design these effects are counteracted by cutting out blades, the effect of which is not manifested in the reduction of power that might be expected. On the contrary the discharge is increased *without* reduction of efficiency.

Investigation of thrust and power shows that the force on each

blade exceeds the product of blade area and the total apparent head, which can only mean that in such cases there is less than atmospheric pressure on the back side of the blade aside from that due to draft head. This is strictly analogous to the distribution of the total force on the wings of an airplane, less than half of which is pressure from below, the remainder being suction on the upper surface. As such suction action is in evidence primarily with these high speeds, the author believes the term "suction" to be peculiarly applicable to this form of turbine runner.

It may be of interest to engineers who have studied runners to note the high coefficients obtained with this type of design. At normal speed the runner has a peripheral coefficient ranging as high at 2.00 as contrasted to the usual 80 to 85 per cent. Similarly at runaway speed the peripheral coefficient is around 4.00 or a speed four times as fast as the full spouting velocity ($\sqrt{2gH}$) of the driving water. At Holyoke it was very unexpectedly necessary to remove the brake pulley in order to safely measure runaway speed. This high limit is quite at variance with the usual trend of decreasing runaway speed as the characteristic speed increases. The lowest-speed runners or the impulse type have the high overspeed of about 100 per cent, a result which reaction (Francis) runners approach less and less closely as their characteristic speed increases from 10 to 100.

It is difficult in practice to secure these high characteristic speeds

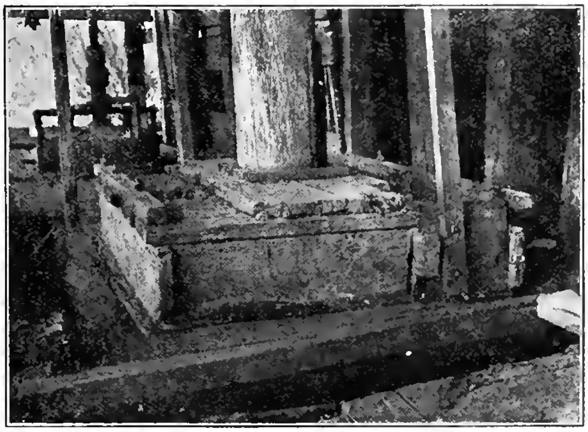

Fig. 6 An Early Type of Turbine

without correspondingly high velocities of the water at the runner discharge. Such high exit velocities running from $0.50 \times \sqrt{2gH}$ up to $0.80 \sqrt{2gH}$ would incur tremendous efficiency losses were no draft tube or diffuser used. On low heads and large capacities a long, straight tube is usually uncommercial on account of the excessive excavation involved and some form of a radial-outward-flow type is practically necessary. White's "Hydraucone Regainer" is the most perfect commercial solution of this diffuser problem yet found for general conditions, and practically all of the installations using the author's runner have been furnished with this hydraucone built either of steel or concrete.

Conclusions

In conclusion it is probably well to outline a few of the possibilities resulting from the development of this runner. In pointing these out it is realized fully that such features as the limit of application to higher heads and possibilities of pitting can only be determined by practice.

In low-head plants where all large power is to be developed it is desirable to use units as large as are feasible. Practical limits, however, are set by generator speed and by size of parts which may cause difficulties in manufacturing, transportation, or in placing these out it is realized fully that such features as the limit of limit is raised by the new design in that for any given generator speed more than double the power can be developed per unit than with the mixed-flow types of reaction wheel.

More general though equally significant illustrations of the extent to which the new type of runner may increase possibilities of hydroelectric development are afforded by the consideration of the following: With any given limit of minimum generator speed and for any given power, the new type of runner will permit turbines to operate under heads one-half as high as those required by the mixed-flow (Francis) runners of prior practice. Similarly, for large powers such units can be developed with low runner cost and without transportation difficulties. As an illustration, this design is the basis of some contemplated units of 800 hp. each under 9 ft.

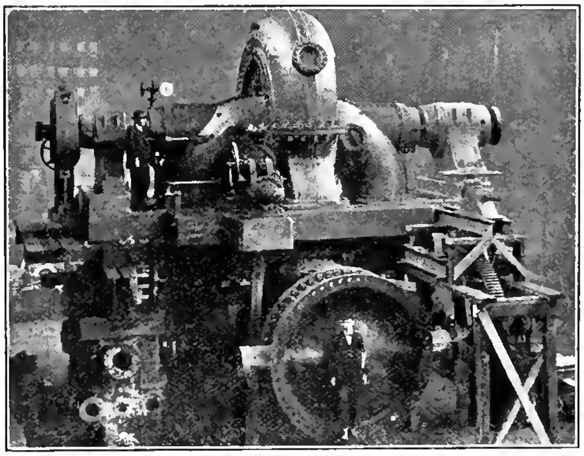

Fig. 7 A 25,000-Hp. Double-Discharge Type of Steel Spiral-Cased Francis Turbine Operating Under a Head of 485 Ft.

head at 90 r.p.m., a design which, it may be said, incidentally eliminates all gates on the turbine and effects all regulation from gates which form part of the power house on the discharge side of the turbine.

Probably the most novel application is to horizontal plants where it is necessary to replace old turbines but desirable to retain the electrical equipment. This has been done practically, a single high-speed runner replacing an old quadruple turbine and giving the same speed and more power with the same head.

Applying an axial-flow guide case with two 45-deg. bends in the draft tube gives as simple flow as possible with any arrangement and contrasts very favorably with the four 90-deg. bends given to the water with a radial-guide-case setting of a horizontal unit. This arrangement and, when floods are prevalent, the single vertical setting using a hydraucone regainer are probably the most advantageous forms of hydraulic-turbine settings that can be devised.

To a generation of engineers whose practical connection with water power has been based almost exclusively on the use of one type of turbine the author's statements as to the short period of time covering real progress may seem somewhat overdrawn. However, one need only look back a comparatively short time to perceive that modern water wheels are young compared to other forms of prime movers. This was never brought to the author's attention more forcefully than by consideration of the views shown in Figs. 6 and 7. The former is reproduced from a photograph presented to the author by William G. Fargo, of Jackson, Mich., and shows a single vertical open-flume turbine having about an 18-in. *wooden* shaft, which was squared at its lower end to receive the four flat paddles forming the runner. Water was admitted through crude "rabbit trap" gates diagonally opposite each other. This wheel was in operation under about 9 ft. head driving a millstone up to a very few years ago, less than fifteen if memory serves correctly. Fig. 7 shows one of the most extreme types using a mixed-flow reaction or Francis runner. This turbine, if not actually in operation at the same time as that shown in Fig. 6, missed being so by but a very few years. That two such extremes so nearly overlap in period of time is the best evidence the author can offer to the effect that the field of hydraulic-turbine design still offers tremendous opportunities for improvement.

Air Pumps for Condensing Equipment

By FRANK R. WHEELER,[1] CHICAGO, ILL.

This paper is devoted to a consideration of past and current practice in air-pump design and selection. After presenting a classification of air pumps the author proceeds to describe briefly the features of each type, stating their limitations and respective advantages and disadvantages. Special attention is given to the steam-jet ejector type of pump, whose advantages are stated to be: extreme simplicity, reliability and flexibility, stability, minimum space and weight, low steam consumption and high efficiency; and furthermore that it requires no maintenance or attention. The author concludes his paper by discussing the selection of an air pump of proper size and capacity for a given condenser installation, and accompanying this discussion are illustrative calculations with references to charts.

THE past few years have brought about decided changes in three component parts of a steam power plant: (*a*) The steam turbine has replaced prime movers of the reciprocating type; (*b*) mechanical stokers of fuel have increased boiler efficiency and ratings; (*c*) improved condensing equipment is now used which will maintain vacua of 29.5 in. referred to a 30-in. barometer under operating conditions and with proper water temperatures. The improvement in condensing equipment is primarily due to the better designs of air pumps adopted and to the radical changes and innovations that have been introduced since 1914, and the following review, dealing with past and current practice in air-pump design and selection, is submitted in the hope that it will prove of interest.

Air pumps may be classified as follows:

- Displacement
  - Wet-vacuum pumps, handling liquid and vapor
    - Simple, 3-valve decks
    - Edwards
    - Rotrex
    - Mullan
  - Dry-vacuum pumps
    - Simple
    - Two-stage
- Impulse
  - Rotary
    - Leblanc
    - A.E.G.
    - Roturbo
    - Thyssen
    - Weir
  - Ejectors
    - Water
      - Koerting
      - Kinetic
      - Müller
      - Radojet
    - Steam
      - Evacter
      - Leblanc
      - Briguet
      - Occluder

As most of these types are well known to engineers, but little attention will be given to the older designs.

Displacement Pumps

Wet-Vacuum Pumps. "Wet"-air pumps have proven their merit for more purposes and duties than is often realized, and are still excellent pumps for units up to 1500 kw. For larger units, however, it is necessary that the rotative speed be reduced, in which event they become both cumbersome and expensive and take up a large amount of space. The volumetric efficiency of these pumps varies from 60 per cent at 3 in. partial air pressure to 18 per cent at 0.5 in. partial air pressure, and since they handle both the water of condensation and vapors, at high vacuum the partial air pressure soon becomes very low unless the condensate is refrigerated by flooding the lower banks of tubes in a surface condenser.

Dry-Vacuum Pumps. The next development was the separating of the handling of condensate and vapors, introducing what is commonly known as the "dry-air" pump. Wet-vacuum pumps of the type previously described were first used with a small quantity of water admitted for sealing purposes, a separate pump being provided to remove the condensate. Later the dry-vacuum pump made with small clearances and handling air only appeared, and this type has the same general advantages as the "wet" pumps, but with better volumetric efficiencies. With improvements like flash ports, introduced by Wellner, to momentarily connect the clearance space at the end of the compression stroke with the vacuum side of the piston, both suction and discharge valves being closed, and using two-stage pumps with double and single cylinders, this type has held its own in the demands for high vacuum and increased sizes. And, except for its complications, the number of moving parts, maintenance, size, space requirements, etc., its use cannot be criticized.

The increase in the size of turbines coming into general use, however, together with the continuous demand for higher vacuum, called for dry air pumps of cumbersome size and excessive cost, and the solution of this problem seemed to point to an ejector air pump of some form, using water as the motive fluid.

Hydraulic-Entrainment Air Pumps

In 1862, Christian Schiels, of Oldham, England, invented a hydraulic-entrainment air pump which expelled the air from a condenser by combining or entraining it with hurling water in its passage through a fan or centrifugal pump. The necessary water pressure was provided by means of a high-speed rotary device and this, together with the relatively small space required and ability to maintain a high vacuum, offered such desirable features that, when the demand had exceeded the limitations of the dry-air pump, development came very rapidly. These pumps took two general forms: In one the air is entrained in the same chamber containing the rotating element. In the other the entrainment or compression of the air is performed in a part of the apparatus entirely separate from that producing the pressure of the hurling or entraining water. These pumps follow the simple ejector principle, using single or multiple jets of water, discharging into a combining cone or diffuser and entraining the air due to the high velocity of the water jets. Under favorable conditions this type will be found satisfactory, its limitations being the amount of water that must be pumped and the necessity of keeping the nozzles thoroughly clean; for the pump must have water, and as it has very definite limitations in its air-handling capacity, it becomes very unstable when called upon to handle air in excess of the designed quantity.

These water ejectors are occasionally used in series with some form of a steam jet which acts as a booster, and they usually take their water supply from a small centrifugal pump connected in parallel with the circulating system.

The hydraulic-entrainment type of pump has given complete satisfaction in performing the function demanded of an air pump, i.e., removing air and vapors from the condensing chamber and maintaining as low pressure as is consistent with circulating-water temperatures. But against the many advantages and satisfactory performances must be balanced the disadvantages. Hydraulic air pumps, using water as their working medium, are subject to erosion, and on account of the necessarily small passages, or sharp edges of vanes, presented to the water, must have clear, clean water or the falling off in capacity and efficiency is very rapid. In

[1] Dist. Mgr. C. H. Wheeler Mfg. Co.

Presented at the Annual Meeting, New York, December 1919, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. The paper is here printed in abstract form. Copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

most cases these essential requirements necessitate a tank for the hurling water, screens, and incidental attention thereto. And on account of the simplicity of the apparatus when compared with the rotary dry-vacuum pump, the admitted high power consumption has been accepted as a necessary evil and provision made to equalize the heat balance by providing electric drive for other auxiliaries.

Steam-Jet Ejector Air Pumps

The ejector principle is an old one, the use of steam as a medium and applied as a vacuum pump having been patented in England in 1868, but for high-vacuum service the ejector pump has not been in general commercial use in this country until the last three years. It is now, however, a definite engineering and commercial success, one manufacturer having actually delivered ejector pumps to serve over 4,000,000 hp. of prime movers.

Before outlining the development of the ejector air pump, the reason for its adoption may be considered by reviewing the advantages claimed for it, namely,

a Extreme simplicity
b No maintenance or attention
c Reliability and flexibility
d Stability
e Minimum space and weight
f Low-steam consumption, high efficiency.

The first advantage enumerated, while the most important, may be passed over as obvious. The second advantage results from the fact that there are no moving parts to wear out; and, because there are no moving parts to oil or adjust, the only attention required is that of opening and closing the valves controlling the pump.

The third advantage claimed is one that will carry the most weight with engineers in charge of power production, because with them continuity of service is of first importance. As is well known and shown later, the air leakage varies greatly and provision must be made for leakages largely in excess of those expected with good operation. With other types of air pumps than those being considered, particularly rotary dry-vacuum pumps, it is usual to provide a pump large enough for maximum requirements and operate at reduced speed or displacement. This has the serious objection of making the entire unit dependent on a single-air pump operating inefficiently. With ejector-type pumps, on account of their small size, weight and space requirements (no foundations being required), the total estimated air-removal capacity can be provided by two or more units, one or more of which can be operated as required, thereby providing maximum efficiency and insurance against shutdown. And the size of units can be so selected that one only is sufficient with a tight condensing system. Another desirable feature is that the necessity of using a second pump is an indication that unusual air leaks exist, and a third advantage is the maximum steam economy resulting from only as many pumps being used as are actually required. The adoption of ejector air pumps by the navies of the United States and France, and the United States Emergency Fleet Corporation supports this claim.

The fifth claim is clearly demonstrated by the following comparative figures for weight and floor space required by three types of pumps for use with a 7500-kw. surface condenser:

Type of pipe	Floor Space	Weight, lb.
Rotary dry vacuum	10 ft. × 22 ft.	31 000
Hydraulic	5 ft. × 10 ft.	6,300
Ejector	1 ft. × 1 ft.	450

As a general rule, for plants of ordinary size (excluding units of 20,000 kw. and over, where better results are obtainable) it may be said that with ejectors without intercondensers less than 1 per cent of the total steam consumption is required for surface condensers, and from 2½ to 3 per cent for jet condensers; for intercondenser ejectors the percentages are approximately one-half these values.

One of the early developments of the ejector using steam jets in series for high vacuum was by Leblanc for his refrigeration system. He was able to obtain an absolute pressure of 0.05 in. Hg, and later applied his design to air pumps for condensers with marked success. The general design is shown in Fig. 1.

This ejector has a single nozzle in the first stage which entrains the air and compresses it in the diffuser, from which it is discharged into a mixing chamber where it comes in contact with the steam from a large number of nozzles of the second stage, the steam and air from the first stage being entrained and compressed to atmospheric or discharge pressure in the second diffuser.

It is well known that ordinary single-stage ejectors work best and are most stable when the compression ratio is approximately one to seven, and it is for this reason that two stages are always employed in steam-ejector air pumps. The ratios of compression in the two stages should be kept as nearly equal as possible, although for maximum economy over varying loads it is found in practice that the best results will be obtained by making the ratio

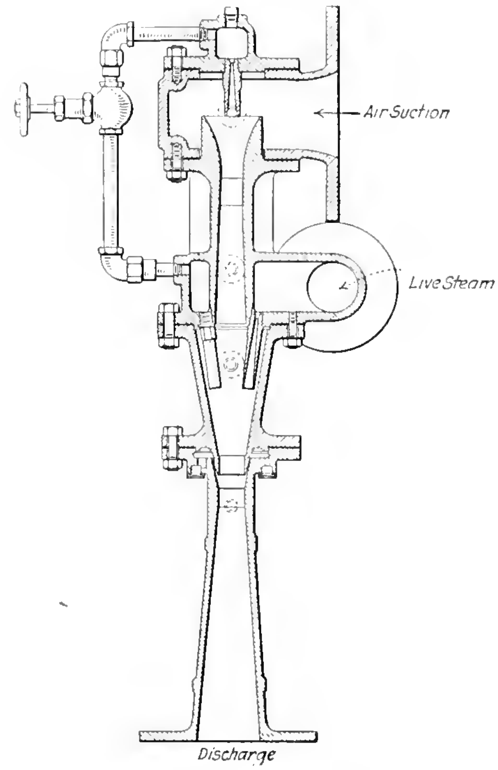

Fig. 1 Sectional View of Leblanc Ejector

of compression in the first stage equal to or greater than that in the second stage.

As has been mentioned before, hydraulic air pumps operate almost entirely by use of the kinetic energy of the motive fluid. The entrained water vapor, carried over with the air, condenses on coming in contact with the water and uncondensable vapors are entrained, either between sheets of, or with small globules, of water and compressed by kinetic energy in the diffuser.

The action in a steam ejector is somewhat different, where there is a fluid to be compressed, moving at a very low velocity, which must be acted upon by steam issuing from nozzles at velocities varying from about 3000 to 3500 ft. per sec. It is quite evident, then, that the operating steam must entrain the air by friction, and also that a maximum entraining surface of the operating steam is of prime importance.

This means that either a number of small cylindrical nozzles must be used, or some special form of nozzle be substituted to give a greater superficial area per unit of steam used. This is of most importance in the second stage, where 70 per cent or more of the steam is used, and may be accomplished in any one of three ways. The first method, that of using a large number of small

nozzles, is objectionable, on account of the difficulty of obtaining effective entrainment with the nozzles in the center of the group. And where the nozzles are placed concentrically or surrounding the first stage diffuser, only half of the exposed steam area is effective.

In the second method a concentric steam nozzle is employed. This nozzle is sensitive to pressure fluctuations and exposes only a small portion of its superficial steam area to contact with the air.

In the third method, using a single steam nozzle in which an adjustable nozzle point spreads out the jet and causes it to flow radially as a thin sheet of steam, the air is entrained on both sides of the sheet and compressed in a radial diffuser surrounding the nozzle. This is the general form of the Radojet air pump illustrated in Fig. 2.

Referring to Fig. 2, steam is admitted from the boiler to the strainer cage A, a part being passed through the pipe B and strainer S to the first-stage nozzle chamber C. The steam expands in the nozzles D and passes across the suction chamber E at a velocity of approximately 3000 ft. per sec., entrains the air and the vapors from the condenser and compresses them in the diffuser F to a higher absolute pressure. The mixture of steam and entrained vapors passes into a double passage G so arranged as to come into contact with both sides of the sheet of steam, and issues radially from the second-stage nozzle. Steam is simultaneously delivered through strainer S_1 and nozzle throat H to contact with the nozzle point J, which spreads the steam radially into a thin sheet of steam issuing at a high velocity and passing across the mixing chamber G, entraining the commingled air and steam (or the air only, where an intercondenser is used) and carrying them into the annular diffuser K, where the mixture is compressed to atmospheric or discharge pressure and then discharged through the volute and opening L.

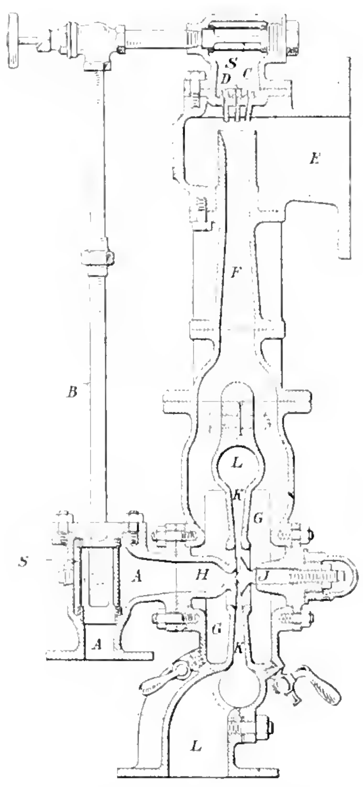

FIG. 2 SECTIONAL VIEW OF RADOJET AIR PUMP

From 70 to 90 per cent of the total steam used passes through the second-stage nozzle. The thin sheet of steam issuing radially from the adjustable nozzle point J, by having both sides of the sheet in contact with the air to be entrained, exposes the maximum surface possible for entrainment and secures for this design the highest efficiency and economy. The nozzle point J being adjustable, permits of varying the cross-section of the nozzle passage and changing the expansion ratio of the steam. This is a factory adjustment and made to secure the maximum efficiency of each individual pump. The first-stage nozzles and both diffusers are made of bronze and the second-stage "Radojet" of special steel. The parts described show absolutely no wear or erosive effect in service.

Ejectors with and without intercondensers are now made by practically all of the condenser companies.

SELECTION OF AIR-PUMP CAPACITIES AND SIZES

The selection of air-pump capacities and sizes has always been shrouded with considerable mystery and the methods to employ should be given more publicity. Air is admitted to the condensing chamber in three ways:

a From leaks in the system, under vacuum

b From entrained air in the boiler feedwater carried over with the steam, and

c From entrained air in the injection water (in jet or barometric condensers only).

The size of air pumps to use with surface condensers, where only *a* and *b* in the preceding paragraph apply, will be considered first. The early air pumps were of the wet type, and textbooks and handbooks of not many years ago gave a rule that the displacement of the air pump should be a function of the low-pressure cylinder displacement. And on this basis, or on the proportions of a successful installation, most air-pump sizes were then selected. Later a rule making the displacement a function of the volume of condensed steam was very generally used and proved to be very satisfactory. This called for ratios of swept displacement of the air-pump cylinder to the volume of condensate of:

20: 1 for 26 in. vacuum	40: 1 for 28 in. vacuum
30: 1 for 27 in. vacuum	53: 1 for 29 in. vacuum

For rotary dry-vacuum pumps of good design the ratio of displacement to volume of condensate for 28 in. vacuum seldom exceeds 35 to 1.

The introduction of ejector pumps using water or steam required that some other method of selection be used. And the adoption of ejector- and entrainment-type air pumps and the general use of large units also called for a more accurate method of selection of sizes. For a number of years experiments and investigations have been made on the effect of air leakage on vacuum heat transfer, etc., all of which have indicated that the presence of only a small amount of air has a very detrimental effect. The relative coefficient of heat transfer as referred to steam was shown by Josse[1] to be 1 to 700. This caused the large operators to introduce periodic tests of their condensers for air leakage, which was accomplished by discharging the rotary dry-vacuum pump into a gasometer.

These periodic tests showed some unexpected results: That a 30,000-kw. unit need not necessarily have a greater air leakage than a 20,000-kw. unit, and that it was possible to keep air leakage to extremely low quantities, dependent on (*a*) the care exercised in installing the condensing equipment and (*b*) on the care in operation, or rather the willingness of the operating engineer to go after small leaks. That a system can be made practically airtight can be demonstrated by shutting down the air pump while the unit is under load, Fig. 3 showing results as reported on a 10,000-kw. unit at the Boston Elevated Station. Here a drop of only 0.30 in. Hg in 30 min. indicates that there was very little entrained air in the steam and practically no air leakage.

The purchaser of a condensing equipment insists that the manufacturer guarantee the vacuum, but with this inquiry, in which he specifies the amount of steam to be condensed, water temperature, etc., he neglects to state how much air he intends shall be allowed to leak into the system. And the writer contends that this is almost as important a factor as the quantity of steam. For this reason the condenser manufacturer is compelled to do a great deal of "educated guessing." We know that with the ordinary system,

[1] *Engineering* (London), vol. 85, 1908.

using open feedwater heaters, the amount of air mechanically entrained in the feedwater is reduced to 1 per cent or less. Orrok[1] showed reductions of entrained air from 4.325 per cent in raw water to 0.9319 per cent in the heater. The air quantity from this source is in direct proportion to the quantity of steam condensed. Leakage through glands, joints, connections, and the materials of which the condenser and the low-pressure stages of the turbines are made, is a function of its size and tightness. Assuming the same care in manufacture and makeup, then size also is a function of quantity of steam condensed and we may assume total air leakage as a factor of the quantity of steam condensed.

In arriving at our figures there are some very uncertain factors to be taken into consideration: Shall we assume the best operation possible, weekly tests for leaks, etc., or the operation of a shiftless attendant satisfied with a spring gage? Inasmuch as the manufacturer is interested in the prosperity of his customer, he assumes the former, and to be sure of his own guarantee, provides for the latter. It is generally known that under good operative conditions the speed of a rotative dry vacuum pump can be cut to one-half its rating, and that there are other times when the full capacity is needed. It is therefore excellent practice to supply air pumps of capacity in excess of the anticipated requirements.

Calculation of Dry-Air Leakage in Surface-Condensing Equipment

Based on a *tight system and first-class operation,* the amount of *dry*-air leakage to be expected with surface-condensing equipment is shown in Fig. 4. It should be noted that this is dry air and is less than the capacity to be provided by the air pump, because, in passing through the condenser this air becomes saturated and the air pump must remove with the air an amount of water vapor dependent on the pressure and temperature of the mixture.

It will also be noted that the air-leakage curves in the figure are indicated in pounds of air per hour. This is done because a pound of air is a definite thing — a cubic foot of air must be specified as to temperature and pressure to have a definite meaning. To those accustomed to thinking in terms of cubic feet the approximate

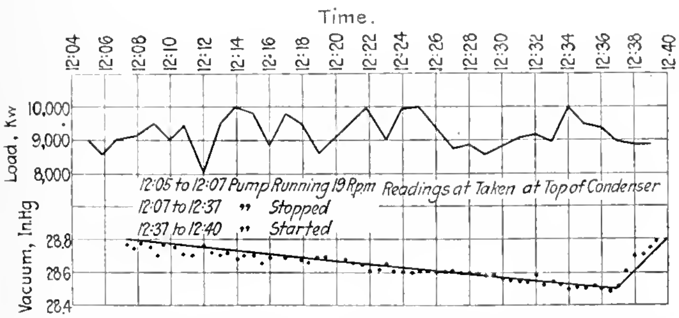

Fig. 3 Curves Showing Effect of Shutting Down the Air Pump While Unit is Under Load
(10,000 kw. unit at Boston Elevated Station)

relation of 4.5 lb. of air per hour to 1 cu. ft. of air per min. at 70 deg. fahr. and atmospheric pressure, will be of some assistance.

According to Dalton's Law, the total pressure in the condenser is the sum of the partial vapor pressure, corresponding to the temperature of the mixture, as taken from the steam tables, and the partial air pressure due to the air or other gas present in the condenser. The volume of the air is directly proportional to its absolute temperature and inversely proportional to its pressure; therefore, if the mixture of air and water vapor in a condenser is cooled, the total pressure, or vacuum, remaining the same, the vapor pressure is reduced and the partial air pressure increased, with corresponding changes in volume.

For example, 1 lb. of a mixture of air and water vapor at 80 deg. fahr, and 2 in. absolute pressure, as extracted from a condenser, would be composed of 0.595 lb. of air and 0.405 lb. of water vapor. Let this mixture be taken from a colder part of the condenser so that its temperature is reduced to 70 deg. fahr., and the relative weights will be changed to 0.724 lb. of air and 0.276 lb. of water vapor; or, to do the same effective work an air pump with a displacement only 0.595/0.724 or, approximately, four-fifths as large would be required. The problem may also be considered as the determination of the total weight of saturated mixture that must be removed from a condenser to extract 1 lb. of dry air, and Fig. 5 has accordingly been plotted to show the weight of water vapor that must be removed from a chamber containing saturated air and vapor to remove 1 lb. of dry air at different temperatures and pressures. These factors must be used in conjunction with Fig. 4.

For example, assume a 10,000-kw. surface condenser condensing

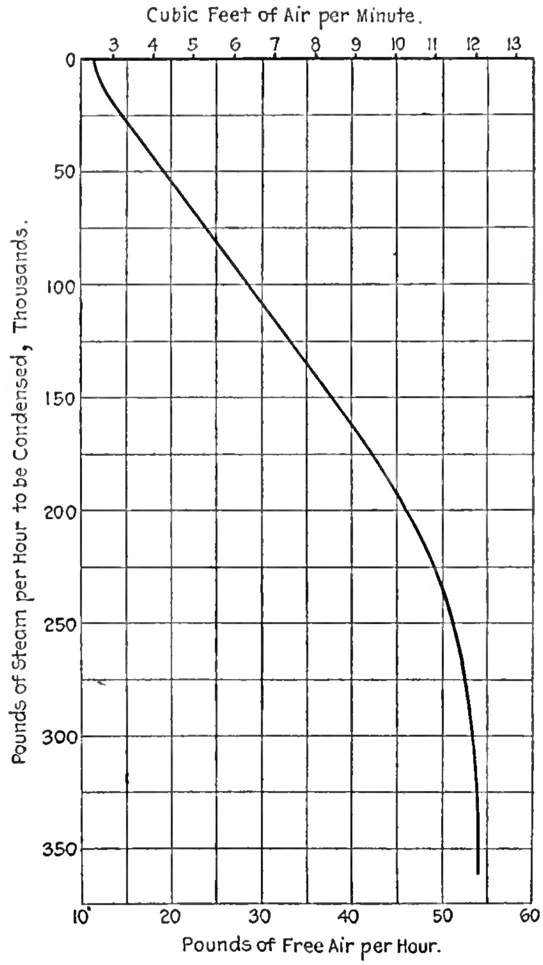

Fig. 4 Estimated Quantity of Air to be Removed from Surface Condenser with Tight System and Good Operation

140,000 lb. of steam per hour, with circulating water temperatures of 60 deg. in and 74 deg. out, a vacuum of 1.5 in. abs. being maintained.

From Fig. 4 it is seen that the expected dry-air leakage with a *tight system and with good operation* is 36 lb. per hour. Under these conditions and with good design the temperature of the mixture going into the air pump should not exceed a mean of the circulating-water temperatures, or 67 deg. with a vacuum of 1.5 in. abs., as Fig. 5 shows that in order to remove 1 lb. of air it is necessary to remove 0.5 lb. of water vapor. Therefore, the air pump must have a capacity of 1.5 x 36 or 54 lb. per hour of a mixture of air and vapor at a pressure of 1.5 in. abs. to take care of a leakage of 36 lb. of dry air. Now this capacity is selected on the assumption of *a tight system* and good operation, and does not provide for emergencies. The usual way to provide for emergencies, unusual operating conditions and excessive air leaks is to select a larger

[1] Trans.Am.Soc.M.E., 1912.

pump and operate at reduced capacities, but the better way by far is to select two pumps of minimum size as indicated from capacity curves. There are several good reasons for this: A spare pump is provided as an insurance against shutdown; maximum economy of power is obtained; and the necessity of the use of both pumps is an automatic indication of excessive air leakage. The steam ejector being so small and not requiring foundations, lends itself most admirably to this selection and can be used in two or as many more units as are desirable, to provide for fractional loads and maximum economy.

Selection of Air Pumps for Jet and Barometric Condensers

In selecting an air pump for a jet or barometric condenser, capacity must also be provided for the entrained air and gases which enter with the injection water and immediately expand to the pressure being maintained in the condenser. Here we have a very uncertain item, for cold water will hold more air than hot water, and water flowing over leaves and decayed vegetable matter absorbs CO_2. The air content will be different in the water of a spray pond or a still lake, or of a slow-moving river or a mountain stream, and will vary under ordinary conditions from 1 to 5 per cent by volume. The quantity of air admitted into the condensing system with the injection water is greatly in excess of that entering with the steam and air leaks, and a considerable quantity of air

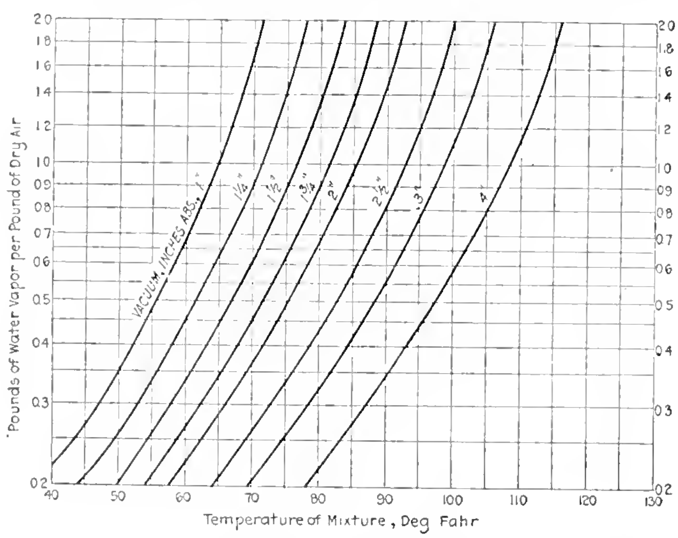

Fig. 5 Chart Showing Weight of Water Vapor That Must Be Removed from a Chamber Containing Wet Air and Vapor to Remove One Pound of Dry Air at Different Temperatures and Pressures

passes out of the system through the water-removal pump or down the tail pipe by entrainment. This latter quantity is sometimes as large as 40 per cent of the total and seldom less that 20 per cent. It is therefore assumed that the air admitted with steam and by leaks in the system passes off with the injection water, and air-pump capacity is provided only for the air entering with the injection water. Taking all these variations into consideration, *dry-air-removal* capacity for either a low-level jet or barometric condenser should be provided as shown in Fig. 6, using as before the factors from Fig. 5.

In this case it is advisable to select two or more pumps so that the total capacity is that obtained from the curve. The ejector pump lends itself to the best advantage in this selection and provides flexibility and economy when the air entrained in the injection water is not as great as anticipated.

To illustrate the selection of an air pump for a low-level jet condenser, assume a 7500-kw. unit condensing 110,000 lb. of steam per hour and maintaining a pressure of 2 in. abs. when supplied with 9000 gal. of injection water per min. at 70 deg. fahr. Fig. 6 shows that we can expect to remove 12 x 9 or 108 lb. of air per hour from the condenser. Assuming the mixture going to the air pump has a temperature of 75 deg., it is seen from Fig. 5 that with this temperature and a pressure of 2 in. abs., it is necessary to remove 0.49 lb. of water vapor in order to remove 1 lb. of air. Therefore, the air pump must have a displacement of 1.49 x 108, or approximately 160 lb. of mixture per hour at 2 in. abs. To provide this capacity in a single unit would require inefficient operation at partial loads, or when the air leakage and content in injection water is not as great as provided for. To use two or more units is also better practice, as then the entire equipment is not dependent on a single air pump.

Most steam-ejector air pumps have their nozzles designed for a fixed initial and back pressure, a pressure-regulating valve being installed in the steam supply line to automatically take care of boiler fluctuations. The maximum back pressure usually specified is 0.5 lb. gage, but this may be increased to a maximum of 3 lb. by increasing the initial steam pressure at some sacrifice in steam economy. Ordinarily, steam-ejector air pumps should be exhausted under water into a surge or feed tank so that the entire heat in the

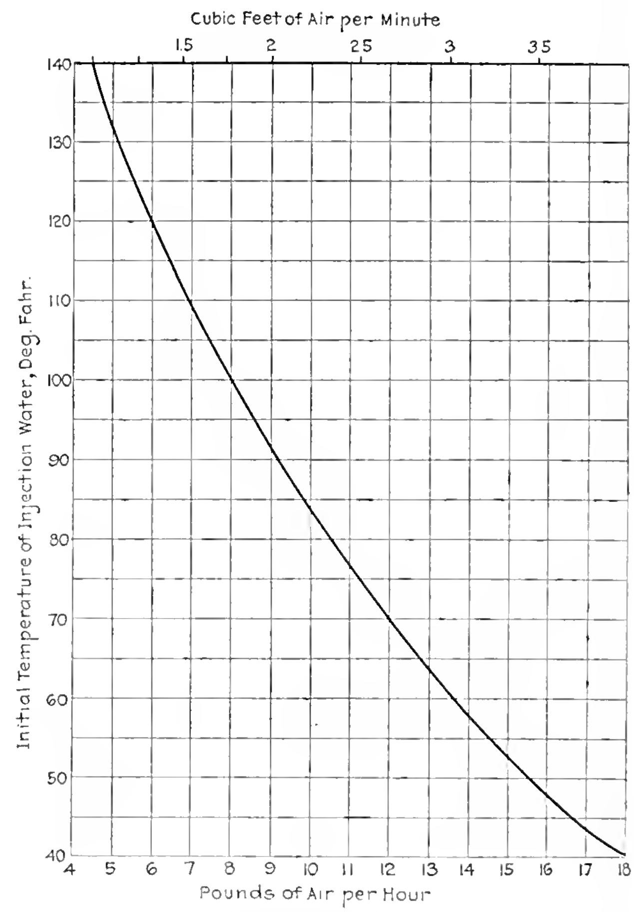

Fig. 6 Estimated Quantity of Air to be Removed from Jet or Barometric Condenser per 1000 Gal. per Min. of Injection Water

steam and air can be utilized, and the entrained air passed off through a vent. The exhaust can be into an open feedwater heater without detrimental effect, provided the heater is thoroughly vented, and also can be piped to any reasonable distance, provided pipe sizes are so selected as not to produce excessive back pressure. If the exhaust discharge is above the air-pump exhaust opening a manometer trap should be provided at the lowest point of the exhaust line, and of such length as to balance the predetermined back pressure. And a check valve should always be installed in the exhaust line from each ejector.

There is nothing to get out of order, to oil, or adjust about this type of pump, and if the screens and nozzles are inspected and cleaned occasionally the owner of a condenser equipped with steam air ejectors can be excused for exclaiming, "Why didn't some one think of this before?"

Appraisal and Valuation Methods

By DAVID H. RAY,[1] PASADENA, CAL.

This paper brings out the need of the engineer's entering the appraisal field in the full capacity which his training and experience warrant. He is likely to be more familiar with the cost and value of materials, machines and structures than the lawyer or accountant, who in the past have been the only ones considered competent to direct this work.

The author shows how the variables affecting values depend on labor, material and an aleatory factor to cover the general risk of the business, with particular reference to marketing. He also defines the terms used in appraisal work and points out the desirability of giving a value to a machine as a unit, of the grouping of similar tools, and of the use of symbols in the form of numbers and letters in tagging the materials to be appraised.

THAT appraisal and valuation work is fundamentally a matter of fair dealing and that, granted experienced technical ability and honest intent, a sensible method or procedure would produce rapid and accurate results, has long been the belief of the writer. This opinion was put to the test in recent work for the United States Government and the judgment confirmed that the difficulties of appraisal work are largely matters of honesty of purpose and of method, or, as the British call it, "procedure."

Method is born of time and consistent effort, and proven method slowly builds precedent into procedure. As in many other lines of effort, we may properly review, for a moment, European experience.

Britain, with her far-flung commercial and industrial interests, has developed methods which by custom and usage have arisen to the dignity of semi-legal and legalized procedure. The English and Scottish Law has come to provide for the certification of qualified appraisers and valuators. While the employment of such appraisers and valuators is not compulsory, a settlement out of court being entirely legal, yet should the matter come to court, the license, charter or qualification of the appraiser or valuator immediately comes into question. A qualified person may carry out appraisals or valuations without a license, but cannot enforce payment for services in the absence of private contract.

British Methods of Appraisal

The larger private appraisals of industrial plants are usually handled by firms of "chartered accountants," while the "compulsory appraisals," on complaint of a rate payer, are provided for by statutory law and by the appointment of an "official appraiser." Boards of trade have jurisdiction in matters of rates and tolls and follow the statutory procedure sanctioned by the British Parliament.

In effect, British procedure under the guidance of the lawyers and accountants has somewhat limited appraisal work to men of recognized integrity and of technical experience in values, defined the method and channel of action, and by usage and customs fixed to some extent the fees for such services. The British, therefore, have a class of professional appraisers, valuers or valuators; in America this function has, in considerable part, fallen to the lot of the engineer.

The engineer is likely to be more familiar with materials, machines, and structures and their cost and value than the lawyer or accountant, but is usually less accustomed to function in a systematic channel of procedure or to be interested in the reasons therefor. Commercial and business practice rather expects and requires this formality, with the result that the engineer usually finds himself serving subordinate to a lawyer or accountant. It is believed that this is neither necessary nor beneficial, and that an engineer might without professional detriment act in the full capacity.

The British system is rather weighted down with technicalities of a legal and an accounting character which are detrimental to rapid and equitable settlements. This appears to be due to the overpredominance of the lawyer and accountant in the development of the British procedure. Had the British engineering societies taken this matter in hand, as there is now the opportunity for the American national engineering societies to do, a simpler, more direct, rapid, and equitable type of procedure might, through custom, have come into use.

Accounting versus Engineering Methods in Appraisal Work

An illustration of the functioning of the legal type of mind and the accountant type of mind in appraisal work is shown in the photograph reproduced in Fig. 1, which pictures an appraisal in which nothing loose escaped being tagged. A spare screw the size of an anise seed was put in an envelope and two tags filled out in detail and attached; it was then inventoried and appraised by two men and listed and carried forward as a separate item. In the case of a set of ten small stamping or numbering punches in a wooden box, a tag was made out for each number and one for the box. Every one of the three dozen clamps shown on top of the shelf at the right of Fig. 1 had its own individual tag and appraisal valuation, signed and certified to by the initials of two men. Every jot and tittle of the law was carried out. Thirty thousand tags were printed to appraise this one plant and were but half enough.

Fig. 1 Complex Method of Inventorying, Where an Individual Tag is Placed on Every Article

In this plant every machine was stripped to the casting, chucks, spindles, collets, tool rests, and holders being taken off the lathes and tool centers, dividing heads and table equipment removed from the milling machines; in fact, all operative parts were taken off, collected, put in groups of a kind in another building, checked and listed. That it was neither possible readily to put this machinery back into production nor to show a prospective purchaser the available parts of the machines or their condition, made no difference; accounting was vindicated and sense sacrificed to system.

Neither of these methods would have been suggested or chosen by an engineer engaged to determine value. No engineer would spend fifty times the cost of a screw in tagging it, nor make out

[1] U. S. Appraisal Officer, N. Y. Dist. A.S.A.P., 1918-1919; member representing U. S. A. on various boards of appraisal; member of the Faculty of Throop College of Technology.

Presented at the Annual Meeting, December 2 to 5, 1919, of The American Society of Mechanical Engineers. The paper is here printed in abstract form. Copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

thirty-six tags for three dozen identical simple tools in the same condition of wear. Nor would he think of making a collection of all the similar parts in a machine shop, for his sense of value would tell him a machine must be considered as a unit, as a going functioning entity for operation or for sale. It is true that parts are interchangeable, but when adjustments must be made to thousandths of an inch, a considerable loss of time and expense is involved in an indiscriminate shuffle of similar parts.

The topic of appraisal and valuation methods is particularly opportune because of the considerable amount of appraisal and valuation work in connection with the settlement of war contracts and because of the expected growth of American commercial and industrial interests abroad; and the present study of appraisal and valuation methods is offered as a contribution to the subject, with the conviction that valuation is essentially an engineering function, and that it is the duty of the engineer to develop, guide and control method and procedure.

Classification of Appraisals

Procedure and reports must necessarily depend in part on the purpose of the valuation. Appraisals may be classified as follows:

Private Appraisals and Valuations in connection with
- *a* Sale, Rent, Mortgage or Bond Issue
- *b* Absorption or Business Combination
- *c* Reorganization
- *d* Liquidation, Insolvency, Letters Testamentary
- *e* Insurance, Private Damage Claims.

Public Appraisals and Valuations in connection with
- *a* Taxation — federal, state, local; Custom Duties
- *b* Condemnation Procedures, Public Damage Claims
- *c* Regulation of Rates, Charges, Tolls
- *d* Public-Ownership Negotiations
- *e* Alien Property
- *f* Mobilization and Demobilization of War Industry
- *g* Material Disposal.

The method of studying and valuing assets commonly calls for a broad division into
- *a* Tangible or physical, such as real estate, structures, appurtenances, equipment and tools
- *b* Intangible or non-physical, such as organization-effectiveness, experienced management, good-will, franchises, patents, etc.[1]

With so many elements, each with possibilities of variation, it should be realized at once that value is by no means a constant quantity but is, in the nature of the case, fluid and variable.

Determination of Value

Whatever the purpose of an appraisal, the writer would emphasize this fluidity of values, and more especially the continuity of values. One of the chief difficulties of appraisers, appraisal boards and commissions is that they do not keep on the path of value — they stray off, get lost in a fog of terms. They then try to locate themselves by assuming an unreal hypothetical "base," a "rate base" or "taxing base," "return base," "capitalization base," etc. Such a "base" in value is an illusion and a snare. In the nature of the case, base connotes permanence, an absolute fixed reference point. Value as the function of numerous variables is continually changing. The correct method is to follow the changes by studying their cause and reason.

The road of value might be said to begin with cost and end with price. It flows along, up or down, broadening or narrowing perhaps, but it is continuous. The mathematical ideal for tracing any flowing value is Newton's method of fluxions or formulæ of flow. It is not proposed to develop by the calculus an exact formula for fluctuating value, but it is desired to emphasize that the variations in value are continual and are best considered in relation to the causes of which they are a function. As a general method, therefore, the value at any time between cost and selling price may be determined, and is best determined for practical purposes by percentage allowances and adjustments for changing conditions.

Value flows from (actual) cost to (fair selling) price and is a function of numerous variables. It is believed that if the principal economic variables are allowed and adjusted for by percentages, value can be traced and determined at any point desired with reasonable accuracy and a fair market value close'y approximated.

The line of flow of value may be pictured graphically as the compound of a number of variables. The three main variables, labor, material and an aleatory factor which covers the general risks of the business with particular reference to marketing, may be plotted separately and then compounded. A composite of these indicates the normal value of an article. The interest return on capital is commonly expected and admitted to be a constant and not a variable factor.

Normal or natural value is therefore determined by cost of production to a considerable extent. Beginning with the simplest case of value, an article composed of a labor and a material element has a value of the actual cost of the material and the actual cost of the labor including overhead, combined with the aleatory element of market conditions as indicated graphically in Fig. 2. The first two lines indicate the tangible or physical value. The aleatory variable combined with these gives an indication of value in exchange or market value. The heavier line drawn normal or perpendicular to the fluctuations of the latter gives the line of "normal" or "*fair* market value."

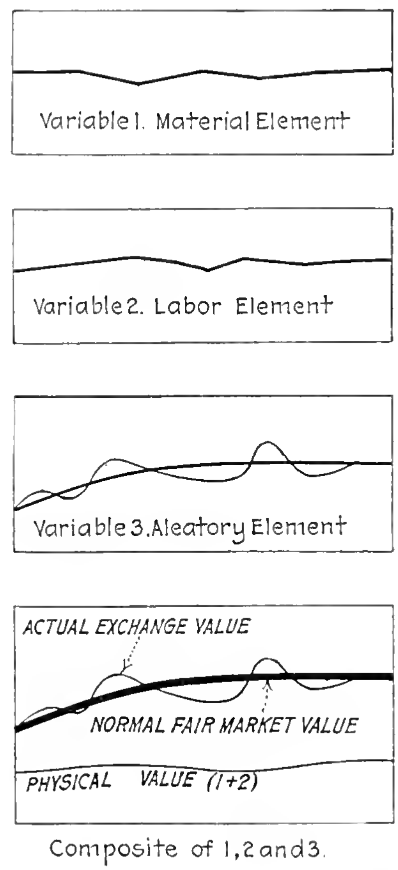

Fig. 2 Lines of Flow in Value of an Article

Commodity Values

Normal values of freely produced commodities tend to be equal to their expenses of production. Any price which yields a greater or less return is unstable. The law of supply and demand operates to oscillate value above or below normal. But as price is a function of quantity demand, the departures from normal are usually not excessive. Other things remaining constant, the quantity demanded increases as price falls, and conversely, the quantity demanded

[1] Development and promotion expenses, advertising early losses in establishing the business as a going concern, are properly allowed for under this heading.

decreases as price rises. "Demand Schedules," i.e., lists of quantities called for and corresponding prices, are usually available for various commodities. "Supply Schedules" give the response to range of price by indicating offerings at various prices. Variation of quantity demand rests ultimately on the principle of marginal utility. The equilibrium between supply and demand schedules, when reduced to graphs, will be indicated by the intersection of the demand and supply curves. Potential supply affects demand-price value nearly as much as actual supply.

While values of constituent labor and material do fluctuate, the changes are usually slow, late and easily discounted. The element or factor varying the most widely is the aleatory element. However, even this does not depart on the average very largely from a normal value. A line of flow of value over any period would then run about as shown in Fig. 3 for the composite for these three major elements.

Industrial-plant Values

Passing now from a simple commodity to an industrial plant, a similar flow of values from actual cost to selling price holds. That the line is by no means straight is the commonplace of commercial experience. Value goes up or down, oscillating sensitively with broad economic opportunity or depression. The law of supply and demand governs. Naturally utility is a big factor, which is not the case in commodity appraisals. Prospects, the law of diminishing return and that of increasing return are elements in the aleatory factor.

A line of flow of value for an industrial plant is the combination of physical value and aleatory value. If the plant is liquidating, the value is practically all in the physical or tangible value. There is little difficulty in determining physical value as it is largely a matter of honesty of purpose and assiduity.

The Aleatory Element

The determination of the aleatory element is difficult because it is composed of many variables which change from day to day, such as the quality of management, experience, ability, skill of the organization, labor conditions, the general demand and supply of raw material and the demand and for supply of the product. The obvious thing to do is to study and fix the major variable elements by careful investigation, comparison, and study, form a judgment, and value and appraise accordingly.

Manifestly the skill and ability of business men and managers should be directed to holding steady the aleatory elements if they take their responsibility honestly and seriously, but the scandal of business is the advantage taken of such opportunity by corporation officers to advance private interests and their own fortunes.

This is one of the factors that has brought on regulation by public-service or public-utility boards. Speculative fortunes, misnamed "profits," have been unfairly acquired by monopoly or jobbery. It has been proposed and attempted to prevent this and enforce fair dealing by a mechanical fixing of rates, wages and salaries. The result, however, has been that life and enthusiasm were crushed out of management and a legitimate element of going-concern value, in ignorance or in vindictiveness, was destroyed. Naturally, the uniform complaint of such regulation is that it "hits value." The *reductio ad absurdum* of regulation would be to fix all the economic variables which wou'd bring value to a fixed base, a condition of stagnation. The essence of the public service or utility difficulty is not so much a question of valuation as it is of ethical responsibility and criminal prosecution of evil corporate activities.

A true appraisal of the aleatory element in an undertaking of any size is bound to be what is known mathematically as an instantaneous value, a value for the ability and integrity of the men involved and the conditions of the moment. Character, fair dealing, trend of supply and demand, etc., can be allowed for as business assets, but they are in the nature of the case speculative and the value is as instantaneous as a stock quotation. Price as the ultimate test of value proves this by its variations and fluctuations.

A stock quotation is a price estimation of a share in a concern under the pressure of supply and demand for the share. It does not indicate, except vaguely, the value of the whole, but may, if full information is available, give the trend of the estimation of the speculative variable. A comparative range of stock quotations is useful but not conclusive.

In connection with the appraisal of war industrial plants which in many cases were going out of business or liquidating, leaving for appraisal merely the physical value and a small speculative opportunity, this matter was thrown into sharp relief. The importance of the elements of organization, management, supply and demand for raw material and products as factors in market value were strikingly evident. At least 50 per cent of the value of a producing concern is in these elements and value will rise or fall as they vary.

Problems of Demobilization of War Industrial Plants

On the signing of the armistice on November 11, 1918, our country faced two big problems:

a The demobilization of the war personnel

b The demobilization of the war material, or the demobilization of the war industrial plants.

In connection with the demobilization and readjustment of war industrial plants to peace service, the writer, as District Appraisal Officer, Finance Division, Bureau of Aircraft Production, New York District, faced the problem of obtaining rapidly appraisal

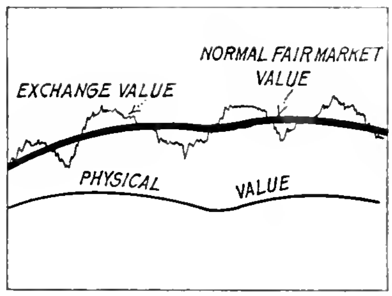

Fig. 3 Lines of Flow in Value of a Plant

valuations for a great mass of war utilities varying all the way from isolated lots of chemicals, coal, textiles or containers to entire industrial plants.

The industrial plants were in some cases "taken over"; in others they had been built entirely *de novo* for war service; while in still other cases they were assembled out of heterogeneous existing buildings, adapted or enlarged to meet the emergency. While some of the latter were entirely completed and went into production, the armistice found some but three-fourths done and which had never gone into production at all. The problem presented itself, therefore, of determining equitable valuations rapidly for the settlement of claims and the restoration of the industrial life of the country to peace channels promptly and without economic shock.

A considerable force of appraisal engineers or appraisal experts was assembled and organized for this special work and a number of engineers were at once assigned to collect, tabulate, and systematize all available data and statistics on prices and wages, and finally to bring the data down to readily usable shape in the form of tabulations, charts and graphs.

This was done for the various materials, such as chemicals, metals, textiles, paints, coal, etc. Also for the usual structural materials of engineering and for machinery. As an exhibit of method, several such charts or graphs for building materials and wages are given in the complete paper. Such information indicating the current variation in values is the first requisite in the equipment of an appraisal office.

At the same time an endeavor was made to gage the future and forecast prices by a study of the trend of the markets and the

economic factors affecting them. No sudden decided general slump in prices or wages was observed in the first six months after the armistice; probably for the reason that demobilization was in general carefully and judiciously managed and also because the normal production in many lines of activity had been interrupted or suspended and was below the demand.

With reference to statistics as a basis for valuation, the general run of unchecked statistics are probably not of great reliability. Indeed, all statistics not tested or checked back to the daily market quotations for material, and to daily wage rates or payrolls for labor, should be used with caution. This applies with equal force to Government statistics. The imprimatur of a Government seal lends often a fictitious importance which may or may not be sustained by checking against hard facts. The empire that depended most on statistics during the war in formulating policies in vital matters, time and time again found its painstakingly classified "reports" unreliable and came to one foolish decision after another. The changing personnel of bureaus subject to politics is

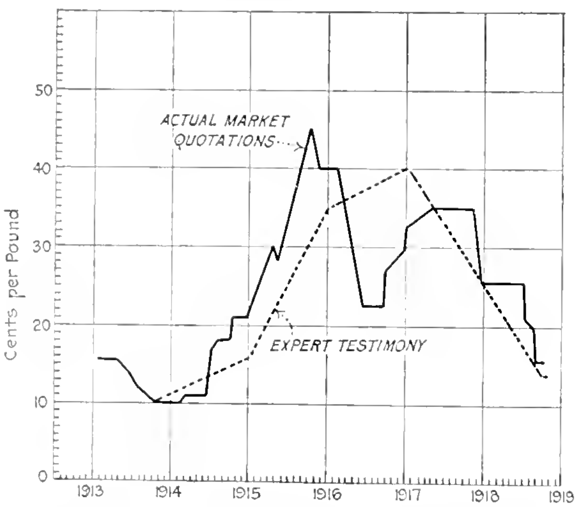

FIG. 4 CHART SHOWING COMPARISON BETWEEN MARKET QUOTATIONS AND EXPERT TESTIMONY ON PAST PRICES OF AN IMPORTANT WAR CHEMICAL

more than likely to be casual and careless in work steadily calling for the highest accuracy and faithfulness to fact.

IMPORTANCE OF DAILY MARKET QUOTATIONS

As for expert testimony on past prices, the experience of the writer in checking such testimony given before a Government appraisal board on which he represented the United States, against the actual daily market prices of a certain indispensable and important war chemical, is shown in Fig. 4. When the facts of market value are a matter of daily record at first hand, it is well to have recourse to them rather than to expert testimony.

Curves and graphs, however, must be plotted and used with sense, for daily market values tend to indicate the extremes of prices, much as a differential thermometer indicates extremes of temperature. It is manifestly inaccurate to judge the temperature of a day by the extremes indicated for a moment by a differential thermometer at, say 1 a.m. and 2 p.m. The limit of variation is defined, and division and allocation will give an accurate average value.

With reference to method of determining fundamental values, therefore, recourse should be had to actual daily market quotations and payrolls rather than to testimony, compilations or unchecked statistics. The facts should be obtained in each instance, and obtained at first hand.

DEFINITIONS OF APPRAISAL TERMS

The terms commonly used in appraisal work should be defined explicitly for the sake of uniformity and clearness in both field operations and in office reports. A memorandum of definitions developed by the writer and used for such purpose in U. S. Government work is given below.

MEMORANDUM FOR APPRAISAL EXPERTS BY DISTRICT APPRAISAL OFFICER

1 An appraisal is a valuation by an authorized person, of definite date. It is a mature, studied judgment, not merely an opinion.

2 A valuation is an estimation of worth, the act of setting a price after mature consideration.

3 Price is the money equivalent for which an article can be exchanged in a current market.

4 Appraisal is therefore the estimation of money equivalent or exchange value in the current market made by an authorized person at a definite time and place.

5 It is only valuation in exchange, and *not utility*, which is, in general, of interest to the appraiser.

6 Careful distinction must be drawn between cost and present value; cost is essentially a past price or value, market value is related to present price.

7 There is no constant uniform relation between a past cost price and a present value price, but the first is useful in arriving at a fair, reasonable estimation of the second, and should be obtained as a basis of departure.

8 In general, an investment should at all times remain unimpaired and this is provided for in larger matters by "amortization," i. e., by an allowance against the gradual dying of a tool, equipment or entire plant, or capital.

9 Amortization is provision for the recovery or the conservation of capital. The principle of the conservation of capital is in the public interest. It is to the effect that the cost of a tool or plant is a proper charge on production pro rata, that a workman or working concern should not use up its tools without an allowance to recover or replace them, and indeed cannot do so, survive and serve.

10 Physical depreciation is the decrease in worth, due to wear, tear, and use. It is the percentage *used* up.

11 Physical amortization is the percentage of value extinguished or "charged off" by reason of decrease in effectiveness, or serviceability for production. It is the shrinkage of value by reason of age or passage of time.

12 Appreciation is increase in value due to economic causes.

13 Scrap value is the value as old material or the fair market price after deducting the cost of removal — perhaps 10 per cent of cost.

14 Salvage valuation in contradistinction to scrap value means the value below which an item will not be depreciated as a going, functioning article or machine — perhaps 25 per cent of original or reproduction cost.

15 In making a valuation of an industrial property account may properly be taken of:

- *a* Original actual costs and year of purchase
- *b* Probable remaining life or usefulness, item by item
- *c* Obsolescence and percentage of inserviceability for efficient production
- *d* Present average market price and conditions
- *e* Any annual write-off made in accounting.

These to be used as a basis of an appraisal, i. e., an estimation of money equivalent at going prices in the current market, singly, and finally as an entity at a definite time and place.

16 A "Fair Value" is that which fair and reasonable men would say ought to be attached to a property under all the circumstances of a particular case; it is an estimation of what under all the facts and circumstances of the case is a just and equitable amount.

17 Fair Market Value is an estimation of the reasonable value obtainable by a prudent, solvent seller from a prudent, willing buyer, both under the necessity of making an exchange in a reasonably brief period of time. It is not immediate-forced-sale or auction-sacrifice-sale value.

18 Fair Market Value is for all practical purposes the actual cost less the physical depreciation or *used-up* percentage, less the physical amortization or a *shrinkage* percentage of decrease in effectiveness for service, with an adjustment to transfer this value to market value.

19 Physical Value: Actual cost less physical depreciation less physical amortization. Fair Market Value: Actual cost less physical depreciation less physical amortization, with an adjustment to present market conditions; or

20 P.V. = A.C. - P.D. - P.Am.
F.M.V. = A.C. - P.D. - P.Am. - M.Adj.

21 Fundamental Diagram (Normal) (Fig. 5)

22 Fundamental Diagram (War) (Fig. 6)

As the basis of any appraisal of physical assets for any one of the twelve kinds of appraisals mentioned in an earlier paragraph, a listing or inventory is necessary. In the appraisal of small lots

of supplies the process is simple. Accuracy in enumeration and in giving a brief identification description is what is required.

PERCENTAGE METHOD OF PLANT APPRAISAL

In the case of the appraisal of an entire plant, however, some systematic method must be devised and strictly adhered to. In general, the plan of attack will be to divide the inventory work into sections as follows:

a Buildings and appurtenances
b Raw materials and supplies or stock
c Goods in process
d Finished products.

Sections *b*, *c* and *d* as a rule call for a straight commercial inventory or stock taking and present no unusual difficulties. Any convenient system of listing and checking that prevents duplication or omission will serve. Section *a*, however, which usually comprises a large percentage of the value, calls for the best skill of the engineer, and is therefore usually handled under sub-classes or symbols. A scheme of symbols and sub-classes that was found serviceable in War Department work is given in the complete paper.

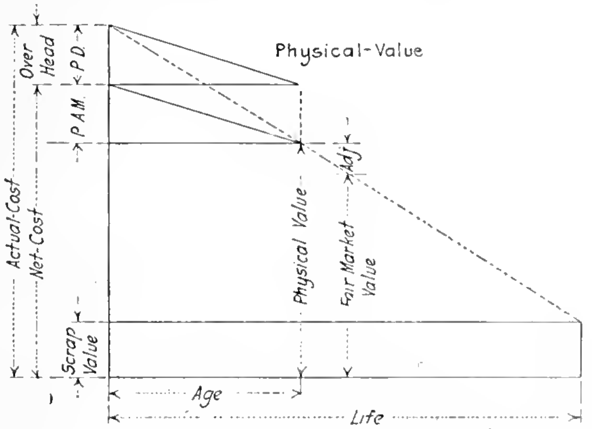

FIG. 5 FUNDAMENTAL DIAGRAM (NORMAL)

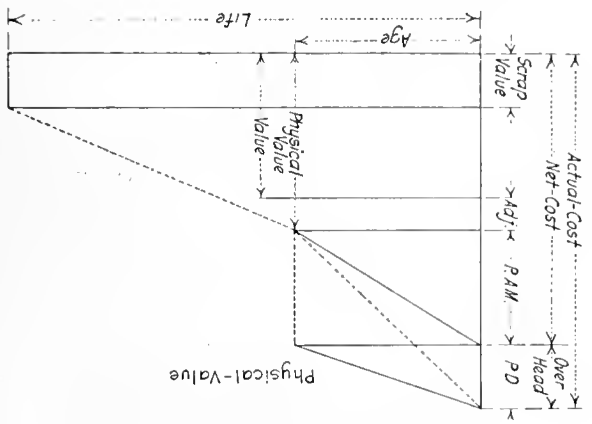

FIG. 6 FUNDAMENTAL DIAGRAM (WAR)

When a plant is to be liquidated and sold either by item or as a unit, it is sometimes desirable in inventorying to leave a numbered tag of identification on the article and to take a carbon copy for listing by symbol on the appraisal sheets. Any permanent identification number stamped on the article or machine should be given as a check in the disposal of the material.

The value of any item as a separate, isolated article may well be different from that for the article considered as a part of an entire functioning plant. Therefore appraisal values set upon tags at the time of tagging must, after being listed by symbol, be reviewed both as a check and as an adjustment to the department or plant as a unit. Judgment and experience must be the guide in these matters.

As a check upon this and as a means of very rapid approximate appraisal, a set of sheets adapted to the formula 20 given in the preceding memorandum were devised with six columns, namely,

1 Physical Depreciation
2 Physical Amortization
3 The Sum of 1 and 2, or the Write-Off
4 The Balance of Value
5 The Market Adjustment
6 The Fair Market Value.

The arrangement of one of these sheets is shown in the complete paper.

If either the approximate cost of the segregation under the symbol or its percentage of the total cost is known, it is then possible by allocation to determine a value and an estimated fair market value for an entire department, or for an entire plant. It should be remembered that an appraisal is not as a rule an outright sale or settlement, but is an estimation and calculation, or a judgment, as a basis for action.

The sub-divisions under the symbols will be numerous and the individual items almost infinite in number; therefore handling an appraisal by itemizing and appraising each individual article, item by item, is long, tedious, and expensive.

The entire matter can, however, be handled on a percentage basis quite rapidly if actual costs are known or determined. If the percentage of physical depreciation by group or even by article is carefully determined and fixed, and the group or article given its proper relative "weight" or approximate percentage-cost importance, it is possible quickly to integrate article physical-depreciation by allocation to group physical-depreciation, and then integrate to sub-symbol and finally to find a value for physical depreciation by symbol and finally for the entire plant.

By this method it is believed that the small errors average, or balance out, disappearing in the successive integrations much as second differentials do in calculus.

ADVANTAGE OF THE PERCENTAGE METHOD

As depreciation and amortization are after all a matter of ratio or percentage, the dollar sign need not appear anywhere in the process of appraisal except at the beginning in the determination of relative weight and at the end in determining fair market value in money.

An additional advantage is believed to be that this method concentrates attention on relativity of value rather than on actual prices, mention of which leads to endless detail discussion and lost motion, and distracts attention from the end to be achieved. The only way in which the ultimate object and purpose can be kept constantly in view is by using weighted percentages and integrating. Experience indicated that the effect of discussing individual money prices was to differentiate rather than to integrate valuation.

Column 5 need not be carried out for each symbol, as it is more than likely that the adjustment for the speculative factor will be practically uniform for an entire symbol, or even for an entire plant. This adjustment percentage must be carefully studied so as to allow for any variable factors favorable or unfavorable, which appreciably affect or enter into value. They should be determined separately by comparison with all available data and given their proper weight in the final integration.

As a check on the more laborious detailed method of appraisal by itemized priced inventory, or as a rapid appraisal where time is a vital factor, it is believed that this method has the advantage of constantly viewing the process as a whole; also the additional advantage that the errors due to its approximations are averaged out by integration and are less than the inevitable errors in the close, near-sighted, detail-price appraisal. Therefore it is not only more expeditious but also more accurate.

The flexibility under rapidly changing markets is apparent. By this method an appraisal by percentage of a large war plant was finished and reported on in ten days. An appraisal on the individual item tag system had been going on for months, with no prospect of its being completed in a year or being in any close connection with prevailing prices at the time of completion of the appraisal, in spite of the amount of time and money expended upon it.

In this percentage method the basis on which the percentage is to be taken must be most carefully checked and determined. The advantages of actual cost, taken in this method as the basis, are believed to be as follows: Actual cost is (1) a past value; it is (2) a definite, absolute figure; it can be (3) closely approximated even if not a matter of record; it can be (4) more accurately determined by reference to records of past material quotations, wages, and payrolls than any other possible "base"; it is (5) logical to adjust this past value to present value, and (6) in doing so the trend of value is necessarily brought under consideration. In connection with war contracts, whether fixed-sum of cost-plus, the actual cost was usually available.

Table 1 shows an allocation of physical depreciation by symbol

TABLE 1 TYPICAL TABULATION OF ALLOCATION BY SYMBOL OF PHYSICAL DEPRECIATION

Symbol	Percentage of Total Actual Cost. (P)	Depreciation by Symbol. (D)	$P \times D$
1	(Laud constant value	by contract)	.....
2	62.97	10 25	646.0
3	7.74	19.83	153.0
4	1.81	13.00	23.6
5	3 56	10 00	35.6
6	4.59	15.00	69.0
7	0.11	40.00	4.4
8	1.52	24.70	37.0
9	2.84	20.00	57 0
10	5 99	20.50	123.0
11	0.19	12.00	2.2
12	2.18	13.60	30.0
13	0.22	25.00	6.2
14	2.20	16.00	35.2
15	(Drawings)	0	.....
16	0.18	90.00	16.2
17	3.78	58.80	222.0
18	0.12	80.00	9.6
		(Average = 14.70)	1470.0

built up from integration of the sub-symbols. In an exactly similar manner the physical amortization can be tabulated and determined.

Divisions of the Speculative Factor

Exact agreement by an appraisal board, without arbitration, has been achieved on physical valuation by this percentage method. The speculative factor is the one on which differences largely occur, but the method has the advantage of concentrating and confining discussion to that topic. This factor may be considered broadly under two headings:

a Going-concern speculative factor
b Liquidation speculative factor.

Under heading *a* the elements contributing value are:

1 Effectiveness of organization
2 Experienced management
3 Good-will, sound advertised reputation
4 Standard product, standard service
5 Patents, franchises, etc.
6 Sound business policy; financial (credit) strength and connection.

These intangibles must be rated by their past and prospective performances, by comparison with similar cases, and judgment taken. In a sense they represent common-stock capital, as against the preferred-stock capital of the physical values, and must be judged by results achieved or reasonably to be expected. In the nature of the case they are speculative and not subject to exact definition. The test is neither so-called "efficiency" nor even production. It is the maintenance and prospective improvement of an evenly balanced, healthy, profitable business life.

A rating or appraisal of this element calls for the most intelligent and careful conservative study of the main elements listed above, and an honest judgment on them individually, and finally as a whole. The capitalizing of these elements on the basis of dividend returns or profit is not a proper procedure, unless it is clearly indicated as a common stock capital or marked clearly as an instantaneous valuation of the conditions of the date which is given. The Supreme Court of Maine has gone on record to the effect that "the capitalization of income even at reasonable rates cannot be adopted as a sufficient or satisfactory test of value."

The Prevention of Value Fluctuation

The necessity of the hour is a balance wheel to business that will decrease the speculative element and prevent wide or violent fluctuations of value. During the past two years there has been a world-wide advance in prices. This is due rather to a fall in the value of gold, or money, rather than to a simultaneous rise in the value of everything else. One very practical suggestion to steady business is the plan of Prof. Irving Fisher, of Yale, for stabilizing the dollar in purchasing power. He says: "With each change in the purchasing power of money (in other words, with each change in the price level) some people lose what properly belongs to them and others gain what does not properly belong to them. Our sense of 'social justice' is offended." These fluctuations cheat the small savings-bank depositor as well as the wealthier bondholder, conduce to social unrest, distrust, and discontent, and produce industrial instability and crises. In a word, they make fair dealing in the conduct of business difficult for those of good intent, and enable those who study values as a pure speculation or gamble to profit without production.

Even the conservative must unwillingly, even unconsciously, become involved when our unit of measuring values shifts 50 per cent in a few years and constantly varies. To capita'ize income to a rate base under these circumstances is unreasonable, unfair, and unjust.

The remedy of legal regulation or restriction aggravates matters by working against effectiveness of organization and against good management by removing the incentive. Price and rate fixing are less important than value and dollar fixing. The former seem in practice to operate on some minds to decrease the importance or even eliminate necessity of good-will. Indeed, the statement has been made in a court of law that under monopoly there is no "good-will." Government control and regulation are a species of monopoly and do not foster good-will. A decline in good-will results in a lower appraisal valuation.

Patents and franchises (if not in perpetuity) have a value which is limited by the life of the patent and the circumstances. These matters are speculative and must be appraised accordingly. They are best considered as individual elements, given their proper weighted importance and integrated as physical value can be integrated.

The Final Value

The combination of the integration of physical value and integration of speculative values gives a final value which should check against capitalized interest or dividend return in the light of all the circumstances of the case. In this way a value may be obtained which is a real basis for production profits and dividends, which will also justify unusual dividends on the basis of efficient organization and management. Let it be said that there should be no objection or complaint against large dividends or profits if large and efficient service has been rendered. The sooner this idea is accepted, the better for every one.

With reference to the procedure in the appraisals for various purposes classified earlier in the paper, the general methods indicated will naturally be varied in detail and emphasis laid according to the special requirements, and the report will stress and elaborate circumstances accordingly. Supply and demand schedules would naturally be of importance in an appraisal for absorption or combination, but of little moment in a matter of liquidation. In material disposal they would be vital, but in a taxation appraisal of much less moment; the exigencies of the case will vary the methods and procedure outlined in the paper.

There will shortly be under the American flag 1731 oil-burning steamers, nearly 10,000,000 deadweight tons. Fuel stations are being established so that these ships may make a world circuit without fueling at other than American-owned stations.

Investigation of Strains in Rolling of Metal

By ALFRED MUSSO,[1] NEW YORK, N. Y.

This paper is a discussion of one of the most important problems incidental to rolling-mill operation. In such mills, while raw stock is being transformed, a certain amount of material is wasted, and to determine the factors involved in this waste, the author asks and answers this question: "What is the most convenient length and width of the piece of metal to be rolled in order to produce a finished article of certain definite dimensions so that the waste of material may be reduced to a minimum?" The answer, which forms the body of the paper, is based on data secured as a result of actual investigation.

When a piece of metal is put through the rolls in a rolling mill, its linear dimensions are strained and the whole piece itself is deformed; in other words, the thickness of the piece becomes smaller while its length and width are increased. These strains are the effect of the pressure which the rolls exert on the piece, and as introductory to our specific subject we will first consider the behavior of a piece of metal under compression.

Let $ABCD$ (Fig. 1) be the cross-section of a piece of metal as subjected to the pressures P and P_1 normal to the faces shown in cross-section as AB and CD. When the compression is carried beyond the elastic limit of the material, the two faces AB and CD

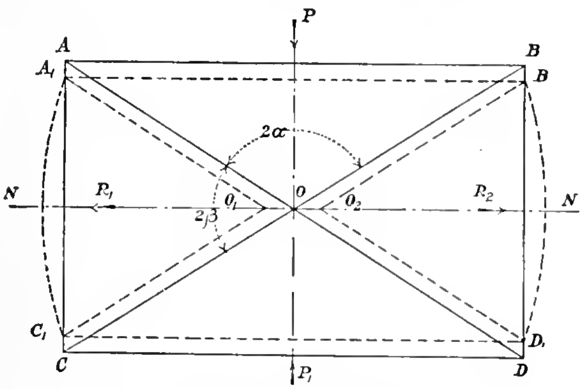

Fig. 1 Cross-Section of a Piece of Metal Subjected to Pressures P and P_1

will come closer together as shown by the dotted lines A_1B_1 and C_1D_1, while the two sides faces AC and BD will bulge outward as shown by the dotted curved lines A_1C_1 and B_1D_1, and if the forces P and P_1 are still increased the piece will ultimately fail by shearing along its diagonals.

The ultimate behavior of the failing piece is influenced by the structure of the metal itself. In fact, experience shows that ductile metals possessing a homogeneous structure, such as copper, aluminum, etc., will become plastic and flatten down to a disk, while fibrous metals, such as steel, wrought iron, etc., where strength across the grain is much lower than with the grain, are not susceptible of any plastic state at all and will ultimately fail by splitting sideways. As it is beyond our present scope, however, to discuss this subject of the failure of metals under compression, it is sufficient for our purpose to regard the piece as shown by Fig. 1 as divided into six pyramids having as a common vertex its pressure center O, and as bases its six faces.

It is obvious that while the compressive forces P and P_1 are tending to telescope into each other along the pressure line PP_1 of the upper and the lower pyramids, the other four pyramids will be pushed outside by the expulsive forces R_1 and R_2 consequently set up by the aforesaid pressures P and P_1. The value of the expulsive forces evidently depends on the two angles AOB and AOC, ordinarily known as *pressure angle* and *expulsion angle*, respectively. We will now apply the foregoing considerations to the rolling-mill process, and begin our investigation of the effects of the roll pressure at any point of the surface of the piece being rolled.

Let Fig. 2 represent a cross-section of a rolling mill through the rolls. NN_1 is the piece of metal going through the rolls C and C_1. Inasmuch as the pressure is exerted radially we may consider it at any point, say at A, which is the initial point of the contact arc AMB. The pressure P may be resolved into two components, one normal to the piece and the other parallel to its surface, as follows:

$$n = P \cos b, \text{ normal component}$$
$$m = P \sin b, \text{ parallel component}$$

where b = angle ACB, known as the *approach angle*. The direc-

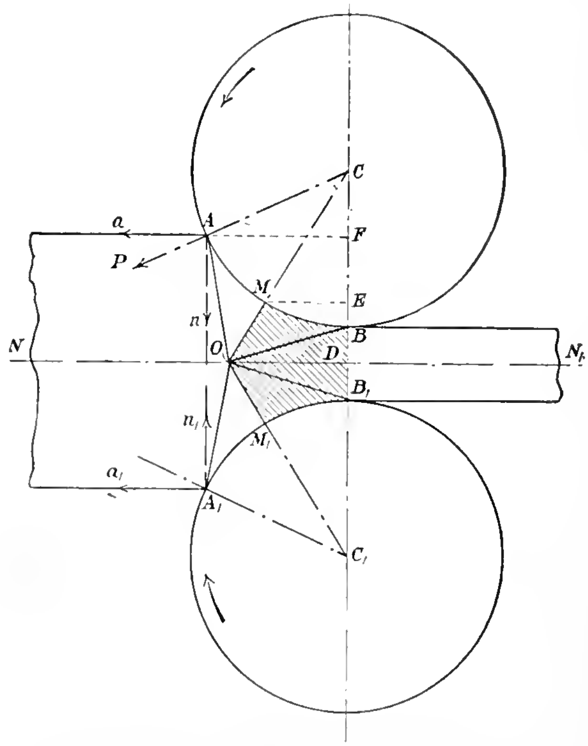

Fig. 2 Cross-Section of a Rolling Mill through the Rolls and Piece of Metal Being Rolled

tions of the components clearly show that while n is the force which actually compresses the piece, m is the component of the pressure which hinders the piece from entering the rolls, and unless n is larger than m, the rolls will not grip the piece.

The useful limit of b is easily found from the relation $n > m$, from which $b <$ 45 deg. The actual value of b for metals is given by $\tan b = c$, the coefficient of friction between roll and piece, but for metals $c = 0.577$ (approx.), therefore $b = \tan^{-1} 0.577 =$ 30 deg., which, according to actual practice, is the maximum value of the approach angle for which the rolls will grip the piece.

Let us now deal with the effect of the pressure on the whole arc of contact AB. We may consider the pressure as applied to the middle point M and the whole piece represented in cross-section by ABB_1A_1 will be divided into pressure pyramids with a common vertex at O. In accordance with previous remarks concerning the behavior of a piece under compression, we deduce that the part of the piece bounded by the contact arcs and shown shaded in the figure is pushed outward by the rolls in the direction of the pass, consequently it is the one we must consider in looking for the elonga-

[1] Gen. Mgr., The Coast Coaling & Engrg. Co. Assoc.-Mem.Am.Soc.M.E.

Presented at the Annual Meeting, December 2 to 5, 1919, of The American Society of Mechanical Engineers. The paper is here printed in abstract form. Copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

tion of the piece. Obviously, when the piece has gone through the rolls, the shaded area $OMBB_1M_1$ will have been transformed into a rectangle, its height being equal to the pass and its base longer than the average base of the original expelled part.

Determination of Elongation. In the complete paper an expression is derived for the shaded area $OMBB_1M_1$, which, as previously noted, must be equal to the area of a rectangle of height b and base of length l, where p = pass (BB_1). The value of l is given by the equation:

$$l = \frac{1}{p}\left(\frac{(2r+p)^2(t-p)}{8r \sin b} - \frac{3.14r^2}{360} b\right) \quad [1]$$

and the value of the average base l_0 of the shaded area by

$$l_0 = \tfrac{1}{2}\left(\frac{(2r+p)\,(t-p)}{4\,r \sin\, b} + r \sin \frac{b}{2}\right) \quad [2]$$

in which r is the radius of the roll and t the original thickness of the piece (AA_1).

The elongation e of the piece will evidently be $l - l_0$, and referring e thus found to the total length of the piece gripped by the rolls, we will have the elongation per unit length e_1. Also, the total length of the piece gripped by the rolls is (Fig. 2) $AF = r \sin b$, whence the percentage elongation e_2 will be

$$e_2 = \frac{100\,e}{r \sin b} \quad [3]$$

Equation [3], besides showing the elongation obtained by rolling a piece of metal, furnishes also other valuable information, namely, a check on the safety of the rolling operation, by comparing the e_2 with the tensile-strength test of the material in question. In the event that the value of e_2 is too large for safely straining the piece, or should it happen to be too conservative, it will always be possible to readjust the pass of the rolling mill to suit, because e is a function of b.

In order to find the side spread (s) of the piece caused by the roll pressure, we will refer to Fig. 3, which is a longitudinal cross-section through the rolls. Let CC' and C_1C_1 be the axes of the rolls, $AA_1 = t$ the original thickness of the piece and $BB_1 = p$ the pass. In this case, since the expulsion angles AOA_1 are equal for both sides of the piece, the total spread will be twice the spread of one side.

By reasoning the same as in the case of Fig. 1, we can easily see the amount of side spread is given by the shaded areas, namely, AOA_1 and B_1O_1B. In this case the shaded area is given by the difference of the areas of the triangles AOA_1 and BO_1B_1, which depend upon the value of the pressure angle a because angle $DAO = a/2$. In the complete paper it is shown that

$$\frac{a}{2} = \tan^{-1}\left[\frac{(r+\frac{p}{2})\tan\frac{b}{2}}{\frac{p}{2}}\right] - \frac{b}{2} \quad [4]$$

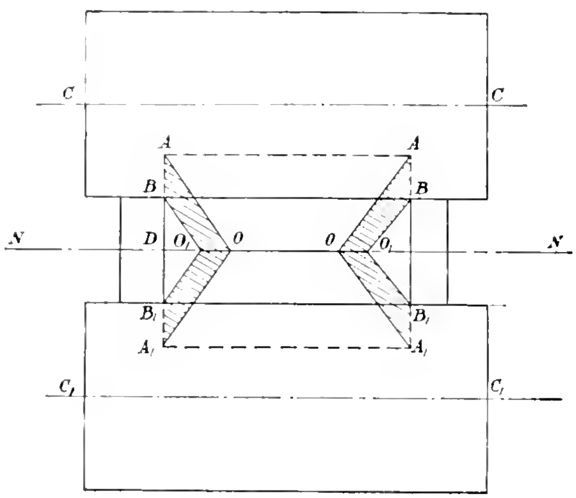

Fig. 3 Longitudinal Cross-Section of a Rolling Mill through the Rolls

It should be noted that the pressure angle is also a function of the approach angle b, and once the value of the pressure angle has been calculated it is easy to find (Fig. 3) the area of the shaded portion, which divided by the pass will give the amount of the side spread at each side of the piece, namely,

$$s = \frac{(t^2 - p^2)}{p} \tan \frac{a}{2} \quad [5]$$

If w is the width of the piece, the total spread per unit of width will be $2s_1 = 2s/w$, and the percentage spread

$$2s_2 = \frac{200\,s}{w} \quad [6]$$

Equation [6] shows that the side spread is independent of the width of the piece, but it depends entirely on the values of the original thickness t and the pass p.

In conclusion the author wishes to present a practical application of the foregoing formulæ by solving the following problem: In the cold-rolling operation a strip of 0.20 per cent carbon steel is put through a 10-in. mill. The strip before rolling is 2 in. wide and 0.065 in. thick. The pass is 0.050 in. Find the percentage elongation and side spread.

The first step is to find the approach angle. The fundamental equation of a rolling mill is

$$t = p + 2r\ (1 - \cos\ b)$$

Substituting and solving, it is found that b = 3 deg. 8 min.. Also, from the above data and Equation [4], $a/2$ = 78 deg. 7 min.

We can now dispose our data as follows:

Roll radius, $r = 5$ in.
Original thickness, $t = 0.065$ in.
Pass, $p = 0.050$ in.
Width of strip, $w = 2$ in.
Approach, b = 3 deg. 8 min. = 3.133 deg.
$\sin b = 0.05466$
$\cos b = 0.9985$
$\sin \frac{b}{2} = 0.02734$
$\tan \frac{a}{2} = 4.75219$

The elongation, using Equations [1], [2] and [3] is found to be 0.06275 in., or in percentage, $e_2 = \frac{6.275}{5 \times 0.05466} = 24.6$ per cent of the original length of the piece gripped by the rolls.

The side spread on either side, from Equation [5] is $s = 0.164$ in., and the percentage spread from Equation [6] is 16.4 per cent.

The result thus obtained evidently shows that the percentage spread is inversely proportional to w, the width of the piece. Now, because of the fact that in rolling-mill practice we are interested only in obtaining the highest possible value of the elongation e, the best economic operative conditions will be furthered by using a strip as wide as possible consistent with the dimensions of the rolls, the power of the mill and above all the degree of uniformity desired in the thickness of the finished strip.

Wage Payment

By A. L. DeLEEUW,[1] NEW YORK, N. Y.

This paper discusses the various items entering into the present relations between employer and employee. The author first calls attention to some of the terms which are most commonly used but of which there is no clear understanding of their meaning. Among these are "capital, labor, right to organize, collective bargaining and wage." He discusses each of these and then takes up the subject of the various systems of payment in existence at the present time. These are straight wages, piece-work system, various systems of bonus payment, premium payment, and combinations of these systems. In conclusion he states that in his opinion the real cause of the present-day unrest lies in the fact that the wage system now in use is not based on knowledge and justice, but only on guesswork and on the fear felt by both employer and employee that the one may "do" the other.

UNREST among the laboring classes has taken on such proportions and is so widespread that it is timely to discuss the various items which enter into the present relations between employer and employee. Many times one or both parties in the conflict try to befuddle the third party, the general public, by statements which are misleading or which are couched in such words as will hide that which is not true. It is well recognized that where two parties have a difference of opinion the first step should be to find some common ground from which to start, and that then the second step should be to define clearly and precisely the chief terms which enter into the controversy. We read practically every day about war between "capital" and "labor," about the demand of the laboring man for the "right to organize," and of his right to insist on "collective bargaining," and yet these three terms, which are perhaps used in every controversy that comes up, are not only not defined but they are actually misleading in themselves.

If war between capital and labor means anything at all, it must mean war between capitalists and laboring men. Capital is the result of past labor used progressively. Without capital, civilization is unthinkable. Capital is the tool with which the laboring man works. There can no more be war between labor and capital than between the laboring man and his tools. There are a large number of people who actually believe and act upon the idea that capital must be destroyed in order to give the laboring man his own. The fault lies with the capitalists or to the present system of control of capital, not with *capital itself*.

In late years the control of capital has been more and more centralized, or, in other words, in the hands of fewer individuals. And though it is well recognized that this condition has its advantages in many ways, yet the dangers to which such centralized control may well lead have caused it to be regarded with suspicion and enmity. Capital being the tool with which labor must work, it is but natural that labor should look with suspicion on an attempt to corner the tool supply. For this reason we may naturally expect that labor will insist upon a better control of their tools, namely, capital.

It has been pointed out many times recently that there are really three parties, not considering the general public, which have a right to be heard in this controversy, namely, capital, labor and management. It seems to the author that this merely leads to complication without any compensating features. Management and labor are both labor, but of different kinds. If at times they clash, it is not due to unavoidable conditions, but merely to defects in one or the other.

Another term quite familiar to all of us is the "right to organize." The writer does not believe that there is an appreciable percentage of employers who would deny their employees the right to organize; for instance, for a baseball team, or a brass band, or sick benefits. On the other hand, nobody would blame the employers for denying their employees the right to organize for the purpose of burning down the plant, or sabotage in the shops, or blowing up the works of his competitors — however beneficial this might be to him in a business way, or for many other purposes. It follows, then, that the "right to organize" must be further defined or at least limited in its scope before we can judge as to the real right of the employee to organize. If the purpose for which the employee wishes to organize is legal and proper, the third party, the general public, will naturally concede this right, and quite as naturally inquire as to whether the employer has really denied this right to his employee.

The facts in most cases where this right to organize has been brought to the foreground, are these: A labor organization, acting within its rights, succeeds in gathering into its union part of the employees of a certain establishment. The employer, fearing that this activity may lead to a strike, attempts to keep the other employees from joining the union; in other words, he tries to organize them with him, instead of with the union. He also acts within his rights and cannot be said to have denied his employees the right to organize. It is doubtful whether in late years there have been many cases where the employer has denied the employee the right to join the union, even if he was not in favor if it. When undesirable conditions or relations existed between employer and employee, or perhaps when union activities led to a strike, it was quite customary to make a demand on the part of the men for the right to organize, — yet this right had seldom been denied; but, put in this way, the general public would get the impression that all kinds of organizations of the employee are taboo. What is really meant by the "right to organize" is that the employer shall give, not to *his men*, but to *some labor union*, the right to come into his shop and organize his men into a union; which is very different from the idea which the expression "the right to organize" conveys.

Another term which is misleading, even more so than those mentioned before, is "collective bargaining." In collective bargaining it is supposed that some or all of the employees have delegated the right to bargain for them to some attorney or business agent. In practically all cases this business agent is their union, and this union is, according to the term used, supposed to bargain with the employer. As a matter of fact, however, there is no bargaining, and, under the present conditions, there can be no bargaining. There have been cases where the men were entitled to all they asked for, and possibly more; there have been cases where the men were not entitled to as much as they asked for, but the method of bargaining has never been employed, and, in the writer's opinion, *could not* have been employed, to settle the differences, because the essential feature of bargaining, which is a process of readjustment of the value of the object of barter in the minds of the two parties concerned, is lacking. The issue has been brought to a conclusion by strikes, or threats of strikes, which is no more a method of bargaining than when a man points a gun at his debtor in order to collect a bill.

In order that there shall be true bargaining, there must be an object to be sold, an object to be given in barter therefor, and an attempt of buyer and seller to modify each other's conception as to the value of what they are offering. In offering labor and demanding money we have no measure nor can we estimate its value by personal observation, as we can in purchasing a house, except after the labor is done, which is long after the so-called bargaining took place, long after the price was set. It is true that labor is sold by the hour, but the hour is a measure of time, not of labor.

At the present time labor is not sold by measure, but a workman sells his time. *This inability to strike a bargain because the value of the product to be sold is entirely unknown, is, in the writer's*

[1] Consulting Engineer. Mem.Am.Soc.M.E.

Presented at the Annual Meeting, December 2 to 5, 1919, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. The paper is here printed in abstract form. Copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

opinion, one of the greatest difficulties to be overcome before there can be an equitable adjustment of the differences between employer and employee. The fact that labor is sold by the hour is equally unjust to both parties. Sometimes the employer suffers, sometimes the employee. In all cases it is a source of curtailment of production, and this leads at once to a discussion of wage system.

"Wage" is defined as remuneration for work done, and also as remuneration for time given. The second definition seems to be defective. In the first place, when money is paid for time given, it is called "salary." In the second place, and this objection is more serious, time alone is not bought or paid for. There are many occupations in which the employee must wait until something turns up for him to do, and then he is supposed to do it. Besides time and labor there enters into such cases the requirement of physical presence.

There are cases where, practically speaking, time alone is sold. Such is the case, for instance, with a stationary watchman. Even in such an extreme case something more than time is paid for: the man's watchfulness and faithfulness. In other cases time and labor are paid for: for instance, with a machinist's helper, or a blacksmith's helper. In still other cases time and skill are paid for: for instance, the man running a large planer or boring mill. The writer cannot think of any case where wages or salary are paid for time alone.

In the great majority of cases it is labor that is wanted, or rather the results of labor, and not time. The great problem is to find a measure for this labor, in order to obtain an equitable way of paying for it. In even the simplest operations of labor there are so many factors which modify the result that it is difficult to establish a unit of measurement. In some of the more complex work it has been possible to subdivide the operations to such an extent as to set a fixed time for a given operation. But even in the very simple operations some factors enter which will cause trouble at times — trouble with the machine, breakages, replacement of tools, and the like.

In a large portion of work there is a combination of time, physical presence, labor, skill, knowledge, judgment, and probably other factors which are hard to define, such as reliability, steadiness, enthusiasm, loyalty, ambition, and whatnot. To make up a formula which would embody all these elements and from which a man's value could be calculated is, of course, impossible. The impossibility of a mathematical solution shows the necessity for the development of a compromise system.

There are various systems of payment in existence at the present day — there are straight wages, piece-work system, various systems of bonus payment, premium payment, and combinations of these systems.

The wage system considers nothing but time and physical presence. A man is selected for a certain task because he or some one else claims that he is fit for that task. If his work is satisfactory he is retained; if not, he is dismissed. Both employer and employee have made a guess. The employee knows exactly what he will get, and guesses at what he will have to deliver. The employer knows exactly what he must deliver, and guesses at what he will get.

With the piece-work system the employer knows exactly what he will get for his money, but the employee makes a guess as to how much he can reasonably do; he has no control over the conditions which will enable him to do, or prevent him from doing, as much as he is expected to.

There are various kinds of bonus systems. The employee may earn his regular wages and get a bonus at stated intervals if his work exceeds the expectations of his employer; or he may be working under the task-and-bonus plan, in which case there is less guessing and more of an attempt at a definite bargain. If the employer is in earnest with such a system, and sees to it that it is possible for the employee to fulfill his task, then this system approaches quite closely to true bargaining.

The premium system is an attempt at gaining the interest of the employee by making him invent improvements in the method of working and sharing the profits with him; but unless the time originally set was carefully studied, and unless all conditions of machinery, tools, existing knowledge, and so on, remain unchanged, this system also will lead to controversies and injustices.

To sum up, the pure wage system is no bargaining in any sense of the word; the piece-work system is only bargaining if employer and employee have reached an agreement, and if there is some mechanism by which this agreement can be changed as soon as conditions change; the pure bonus system is nothing else but a wage system with a kind of profit-sharing plan; the task-and-bonus system, if properly worked out, and if accompanied by complete instructions to the employee, is a perfect bargain, but must be constantly revised as conditions change. However, this system carries with it the necessary mechanism to effect these changes.

Labor unions are fighting organizations, the army with which the laboring man fights the employer. If fighting has given them, if not all, at least a large portion of what they desired, it is but natural that they should consider war the best means of reaching their ends. The unions, so far, have not offered any constructive suggestion, and this cannot be expected from a fighting organization. Furthermore, it is to the personal interest of union leaders to hold to this system. It may be taken for granted that there have been, and are, many unselfish union leaders, but this does not offset the general tendency of the system to perpetuate itself as a fighting organization.

Another reason why the attempt of the employer to put labor on a contract basis has not been well received by the labor unions, lies in the historical fact that on account of occasional scarcity of work it became one of the principles of the union to take measure to insure that whatever work was available should be sufficient to keep the union men in employment. The three chief means used to accomplish this were: first, to prevent anybody but union men from working at the trade; second, to limit the number of apprentices, or in general, newcomers in the union; third, to limit the output per man. The second item has not been strictly adhered to, because it was found that by limiting the number of men in the union the number of men outside the union was increased, thus decreasing the relative fighting strength of the union. The first item has been strictly adhered to, but has often been denied by the union, probably for the purpose of satisfying public opinion. The third item is still generally adhered to, but is mostly camouflaged.

Taking the aims of organized labor to be:

1 Proper share of the proceeds of labor
2 Reasonable working conditions and working hours
3 Right to organize
4 Collective bargaining,

the writer believes that these aims could all be accomplished without strife if the last item, collective bargaining, were put into actual practice instead of being a mere catchword.

If employers and employees together would put as the first item in their catechism the truth that the world must produce more in order to have more, if employer and employee together would try to find an equitable way of estimating the value of work done, if both would subscribe to the truth that no permanent gain can be made by wearing out a man's capacity for work nor by allowing him to work less than he should for the good of the world at large, if then employers and employees together would organize a Bureau of Research for defining the conditions under which various classes of work should take place, and if, finally, an attempt were made by both employers and employees to classify men according to their natural or acquired ability, there would be very little reason left why a union should be a fighting organization.

Up to the present time the unions have acted entirely through their business agents, who sometimes had, and more often had not, a clear idea of the problems involved in the trade they represented. Whatever knowledge they might have had was not permitted to come to the foreground. It seems to the writer that the time has come for the unions to take the first step along the lines of considering union activities as a legitimate business, and legitimate business cannot shut its eyes to facts, however disagreeable to contemplate they may be. It is his belief that the crux of the solution lies in the establishment of a proper wage system, and that in order to establish such a system the engineer must come to the assistance of labor in order to find standards of value for work done. Though it is not likely that there will ever be a time when

COMBUSTION OF HEAVIER FUELS IN CONSTANT-VOLUME-TYPE AND SUPERINDUCTION-TYPE ENGINES

By LEON CAMMEN,[1] NEW YORK, N. Y.

Well-recognized liquid-fuel conditions make it imperative to prepare for the demand for engines capable of running on fuel heavier than gasoline, such as paraffin gas oil and similar products. The cardinal element governing the design of such engines is the rate of combustion of the fuel-air mixture, and since oil-air mixtures have a much lower basic rate of combustion than gasoline, conditions have to be created in the cylinder which will accelerate the combustion. One method of doing this, suggested in the paper, is by the use of superinduction, and an installation is described showing its application, and formulae for power output are deduced. The design of kerosene engines and the carburation of kerosene and similar fuels are discussed in some detail.

THE demand for gasoline is so great that it becomes imperative to look for other fuel supplies, either heavier oils of petroleum base or such fuels as gasoline, benzol, etc. The present paper considers mainly the combustion of kerosene and still heavier fuels in engines of the constant-volume type, that is, engines such as are at present used in motor cars, tractors and aeroplanes.

The conventional motor-car or aeroplane engine of today has reached such a state of development when operating on gasoline or equivalent easily vaporizable fuels that only small improvements may be expected from a further refinement of design. In fact, it is doubtful if the time devoted to its perfection would be well spent in view of the fact that what the world needs mainly today is not a better gasoline engine but an engine that will work better on a fuel costing about one-half to one-third what gasoline costs or is likely to cost in a couple of years.

The first effort to meet this situation was made in the direction of adapting the conventional engine to the use of kerosene, which proved, however, to be a much more difficult proposition than was expected at the start.

Two methods, singly or in various combinations, have been resorted to by designers of kerosene engines in order to make it possible to burn that fuel. The first and most obvious method has been to preheat the fuel, but this apparently leads to the break-up of the higher hydrocarbons present in kerosene and the evolution of free hydrogen and possibly formation of acetylene or acetylides. The presence of free hydrogen leads, however, to a very high acceleration of the rate of combustion of the mixture and creates the phenomenon generally known under the name of "kerosene knock."

The other way in which the solution of the problem of burning kerosene has been attempted has been by means of the extremely fine atomization of the fuel. There have been two considerations underlying this idea.

The first was to burn kerosene with air, not as a mixture of gases but somewhat in the same manner in which explosions of coal and grain dust take place; that is, converting the kerosene into such a fine "powder" or fog as to insure a very intimate contact between it and the air. The other consideration was the desire to vaporize the kerosene at a point far below its end point of distillation. If the kerosene is very finely broken up and heated to about 225 deg. the vapor tension between the extremely small drops and air is sufficient to vaporize the fuel.

Tests made by the present writer, however, have indicated that to secure this result the atomization of the kerosene must be very fine indeed, a condition not easily secured because of the high average viscosity of kerosene and the greater toughness of the surface skin. It proved possible to vaporize kerosene in conventional carburetors by using a large number (300 and more) of extremely small jets (1/8 in. deep and shaped as a semicircle 0.003 to 0.004 in. in diameter). Later tests have brought out a rather interesting fact, namely, that this arrangement of a large number of very small jets which gave good results on kerosene proved to be very poor for use with gasoline.

But even atomizing kerosene finely at the nozzle of the carburetor seems to be only half the battle and a number of other conditions must be satisfied before it is possible to obtain successful results.

The first question is that of delivering the atomized mixture to the engine cylinder which employs proper manifolding not only outside of the cylinder block casting but inside of it as well. Since a kerosene-air mixture carries the fuel largely in a state of a fog or very fine drops, any bends, loci of turbulence or cold places are apt to cause condensation of the kerosene.

In other words, kerosene-engine manifolds have to represent the nearest possible approach to a straight-line flow with the minimum of changes of direction and have to be designed from end to end with an eye to some relation like the Fanning formula. To take care of these conditions a design has been evolved, or rather adapted, in which the carburetor sits right at the cylinder head, the manifold is cast into the cylinder head and the mixture flows in an absolutely straight line from the mixing chamber of the carburetor to the valves; the only abrupt turn being at the valves, where the temperature conditions are such that condensation need not be feared.

Furthermore, the temperature in the manifold should be strictly controlled, it being desired to bring the kerosene-air mixture to a temperature of approximately 225 deg. without, however, exceeding it, and also without using an exhaust-gas heater which would involve a large frictional resistance to the flow of the mixture with attendant condensation. Because of this the entire work of preheating the kerosene-air mixture was thrown on the manifold itself by placing the manifold in the cylinder head, which latter has no jacket, while the walls of the cylinder are liquid-cooled. The head, therefore, is cooled partly by radiation and partly by the flow of gases through the manifold, and it has been found that with kerosene as fuel and an outlet-jacket-liquid temperature of about 210 deg. fahr. the temperature of the head is in the neighborhood of 350 deg. fahr., which is just that required to raise the temperature of the mixture flowing to about 225 deg. fahr. This resulted in a good mixture being delivered in good shape to the cylinder, and all that remained to be done was to burn it there properly, a problem easier stated than solved.

A large number of tests by the writer, confirmed by similar tests made by the Office of the Director of Military Aeronautics, War Department, have shown that the amount of crankcase dilution is directly related to the temperature of the engine and is much greater in a cold engine than in a warm one. Also, numerous tests have shown that in order to properly burn kerosene the cylinder-wall temperature has to be under good control and somewhat higher than for gasoline engines; the main reason for this being that, other things being equal, the rate of combustion of kerosene-air mixtures is considerably lower than that of gasoline-air mixtures, which may be expressed otherwise by saying that the *basic* rate of combustion of kerosene-air mixtures is lower than that of gasoline-air mixtures.

In fact, it would appear that the entire design of an engine should be built around the rate of combustion of the fuel-air mixture used in driving the engine. This factor was of course unconsciously taken into consideration by the early designers of gasoline engines, but the proportions derived from their practice have been, still unconsciously in the vast majority of cases, applied to kerosene engines. It becomes therefore of prime importance to determine by what factors the rate of combustion in an engine

[1] Associate Editor, MECHANICAL ENGINEERING.

Presented at the Annual Meeting of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS, New York, December 2 to 5, 1919. The paper is here printed in abstract form and copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

cylinder is governed, apart from the physical properties of the explosive mixture itself. The most important factor governing the rate of combustion in the cylinder of an internal-combustion engine is the temperature of the mixture, and because of this it becomes important to determine what affects the temperature of the mixture in the cylinder of an engine of the constant-volume type during the course of combustion.

In the first place, of course, the temperature of the mixture is materially affected by the temperature of the cylinder walls, which means temperature of the cooling fluid.

The next factor affecting the rate of combustion of the mixture is the compression available, which means, however, a good deal more than the "compression ratio," which is often alone taken into consideration.

The compression ratio, as such, determines only the upper limit of compression, that is, the compression pressure at maximum filling of the cylinder; but at partly open throttle there is a partial filling of the cylinder and a different final compression pressure. Hence a different final temperature of the charge. In other words, the final compression pressure depends not only on the compression ratio but also on the volumetric efficiency of the engine during the given cycle.

Therefore, if a kerosene-air mixture ignites well at, say, 500 deg. fahr. and if this temperature is produced by the compression in a given engine at maximum filling of the cylinder, at full throttle, at half throttle or half filling the compression pressure will be roughly one-half and the temperature of the mixture will be lower in accordance with well-known laws. But if combustion in a kerosene-air mixture proceeds at a certain suitable rate when this mixture is at an initial temperature of 500 deg., a much lower rate of combustion will be maintained when the temperature is, say, 375 deg., and the point may be, and actually is, reached when explosive combustion does not take place at all.

In common parlance this is described by saying that the engine "lacks flexibility" or "does not idle well."

This trouble is fundamental and does not depend on the design of a carburetor. There are only two ways to overcome it. One is by varying the temperature of the induced charge, making it colder at full throttle and warming it up at low throttle, which is, however, only a crude solution of the problem and does not meet all conditions that are encountered. Another method of meeting the same conditions would be to use a variable-stroke engine of such a construction that the full stroke is used in connection with wide-open throttle and a reduced stroke when the throttle is partly closed. It is very doubtful whether such an engine can be built with a mechanically operable piston, but its equivalent may be obtained in a somewhat roundabout way by using one of the variations of the superinduction principle. Thus, a design of engine is shown where the bottom of the cylinder is covered with a cushion of either air or inert gas when the engine is operating at low throttle.

Further consideration of the subject, especially with regard to fuels used heavier than kerosene, such as paraffin gas oil, having also lower rates of combustion, indicates, however, that compression pressure determines not so much the actual rate of combustion of the charge as the initiation of the combustion, while the actual rate of combustion at each instant depends on the expansion pressure obtaining at the preceding instant during the process of combustion. But the expansion pressure may be raised by ramming into the cylinder a greater charge than it will take when supplied with air at atmospheric pressure, which brings us to a point where we may consider what is known as a "superinduced" engine.

To sum up what has been said above, it may be stated that because of the low basic rates of combustion of the lower grades of fuel (from kerosene down to paraffin gas oil) it is hardly possible that the conventional motor may be made to handle them with the same flexibility as it does gasoline, and if lower grades of fuel are to be burned in our automotive engines these latter will have to undergo a much more thorough change in design than a makeshift adaptation, namely, a change that will bring about a high rate of combustion in a charge consisting of a fuel having a low basic rate of combustion. This condition can be accomplished by superinduction, and so far no other means have been indicated to produce the same result.

It may be stated in this connection that work which stops at enabling us to burn only kerosene will not relieve the present serious fuel situation for any appreciable length of time, because the supplies of kerosene cannot be easily increased to an extent sufficient to meet the demands of the automotive industries. Furthermore, the difference between the cost of gasoline and that of kerosene is not large now and would become still smaller if a large demand were created for kerosene. On the other hand, such fuels as paraffin gas oil with a heat content of about 140,000 B.t.u. per gal. sell for about 6.5 cents per gal. as compared with 23 cents for a gallon of gasoline having a heat content of about 125,000 B.t.u. per gal. It is therefore to these cheaper and far more plentiful fuels that we must look for a relief of the impending fuel shortage.

Briefly, superinduction may be defined as a method of operating an engine of the constant-volume type so that the pressure in the cylinder at the beginning of compression is higher than the atmospheric pressure.

The complete paper, after giving a brief account of the work done in this direction, describes an unconventional type of engine with two carburetors. The main carburetor feeding a conveniently located inlet valve is supplied with atmospheric air. The auxiliary carburetor feeding an inlet valve located at the bottom of the cylinder and uncovered by the piston at the end of the induction stroke is supplied with air delivered at a pressure of, say, 30 lb. abs. The operation is as follows: The main inlet valve opens as in conventional engines, but when the filling of the cylinder from the main inlet valve has been very nearly completed and a pressure of about 12 lb. abs. prevails, the auxiliary valve opens and the charge delivered therefrom raises the pressure at the beginning of the compression stroke to a value in the neighborhood, say, of 25 lb. abs.

In order to produce a balanced operation of the auxiliary carburetor the same pressure (i.e., 30 lb. abs.) is maintained in the carburetor inlet, the carburetor float chamber and the fuel tank, two fuel tanks being used — one for gasoline for the main carburetor and another for the auxiliary carburetor.

Furthermore, since there is a greater difference of pressure between the float chamber and the inlet manifold in the auxiliary carburetor than would have been in a conventional carburetor, a better atomization of the fuel is secured which makes it possible to use oils heavier than kerosene, such as, for example, paraffin gas oil. Moreover, while the compression pressure is roughly the same as in the conventional engine, the expansion pressure is a good deal higher, which makes it possible to secure a higher rate of combustion with paraffin gas oil as compared with what it would have been with conventional expansion pressures.

As regards the process of ignition, the top layer of the charge, which is mainly a gasoline-air mixture, is ignited first and by its combustion brings about conditions which permit an explosive combustion of the paraffin gas oil-air mixture, thus securing practically the same flexibility with the new fuel as with straight gasoline in conventional-type engines.

In the original article formulæ are given for computing the power output of superinduction engines of the type described, from which it appears that a four-cylinder 3.5 x 5 engine running at 1800 r.p.m. is capable of delivering 78.6 hp. as compared with 32.5 hp. for an engine of the conventional type. This means that the superinduction engine not only consumes a cheaper and more plentiful fuel, but that it is far more powerful than the conventional engines.

The basic idea of the paper is that the high-speed, high-efficiency fuel-oil engine that will take the place of the present extremely efficient gasoline engine such as is used in all our automotive equipment, has to be designed with a far clearer understanding of the processes of combustion than is evidenced by the engine of today. In other words, the good fuel-oil engine of tomorrow will have to be first and last a better engine intrinsically than anything we have today.

E. F. C. Water-Tube Boiler for Wood Ships

By F. W. DEAN,[1] BOSTON, MASS., and HENRY KREISINGER,[2] PITTSBURGH, PA.

The following paper describes and reports tests upon the standardized water-tube marine boiler designed by the United States Shipping Board, Emergency Fleet Corporation. In view of the large number of boilers needed (1352 ordered), the scarcity of steel and the desire to secure competitive prices, the water-tube type was adopted instead of the Scotch marine type, making it possible to have the boilers constructed in inland shops throughout the country, and effecting a reduction in the weight of steel of more than 9,000,000 lb. for the total order. The boilers had a grate area of 65.54 sq. ft., heating surface of 2500 sq. ft. and a commercial horsepower of 435 on the basis of the marine rating of 6 lb. of water to a square foot of heating surface per hour. Part 2 of the paper gives details of an investigation made by Mr. Henry Kreisinger of the Bureau of Mines on the mixtures of air and combustible in the boiler furnaces and of the temperature of the gases.

PART 1 DESCRIPTION OF BOILER AND RESULTS OF EVAPORATIVE TESTS

By F. W. Dean

In 1917 the Emergency Fleet Corporation embarked upon a program of building a great fleet of wood ships for the purpose of quickly meeting a great emergency. Wood was selected, not only for accelerating delivery, but for reducing the demand for steel which was needed for steel merchant and naval vessels.

At first it was intended to build 1000 wood ships of 3500 tons deadweight capacity each, and each ship would require two boilers containing about 2500 sq. ft. of heating surface each. The problem of securing 2000 good-sized boilers was a serious one and naturally caused careful consideration of the relative merits of water-tube and Scotch boilers. The natural inclination was to use Scotch boilers, but the boiler-making capacity of the country on the sea coast, or on waters tributary thereto, was insufficient to produce them in a reasonable time, to say nothing of the capacity of the mills of the country to produce the steel and steel plates required if Scotch boilers were used.

It was decided to use water-tube boilers, as the weight of steel in one of these boilers, with casing, is 41,200 lb., while for the equivalent Scotch boiler it is 110,000 lb. The saving of steel for the 1352 boilers finally ordered was thus more than 9,000,000 lb.

Furthermore, the adoption of the water-tube type rendered most of the boiler shops of the country available at such inland places as Battle Creek, Mich., Chattanooga, Tenn., and Allentown, Pa. All told, they were built by 19 different contractors.

Still further the competition coming from the adoption of the water-tube type, taking into consideration prices asked by some of the regular makers of marine water-tube boilers, resulted in a saving which is estimated to have been about $7,000,000 for the requirements of the program. While the Emergency Fleet Corporation has been accused of extravagance, credit for this piece of economy should be given to it, and this is due to the engineering department.

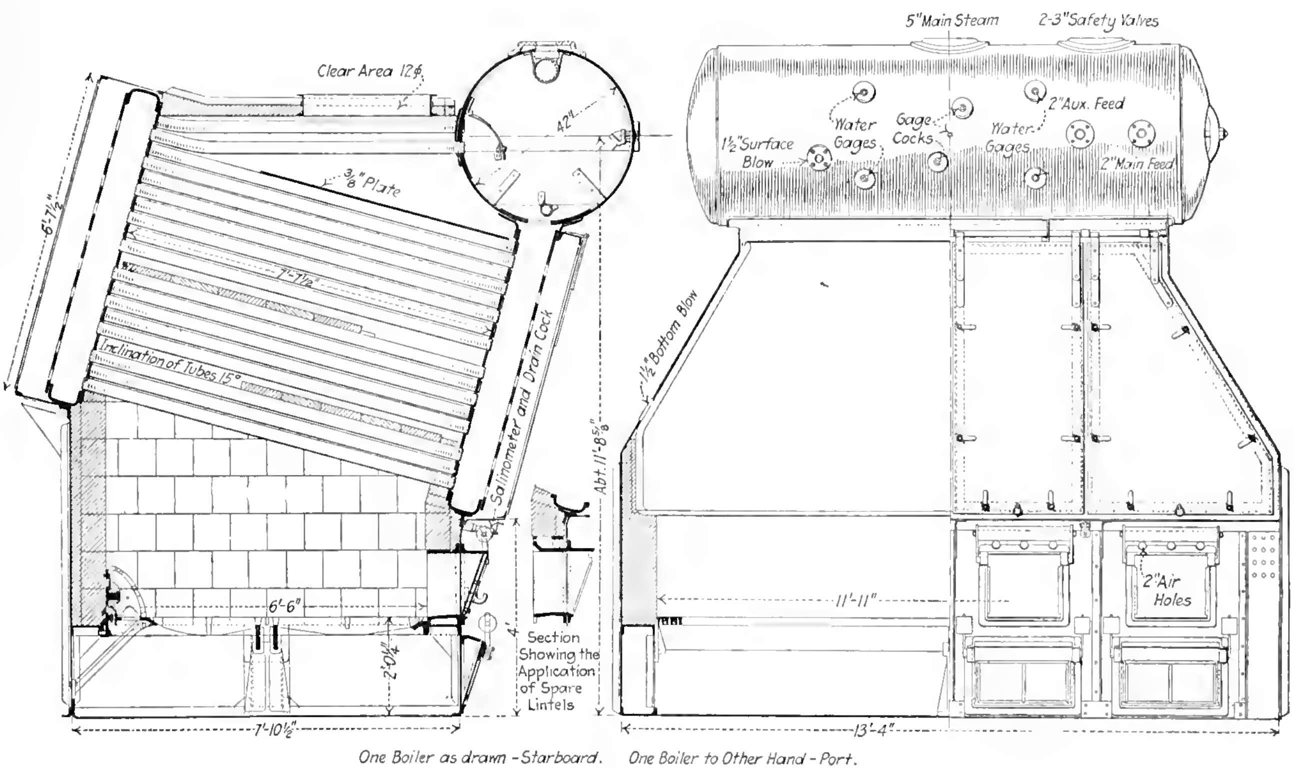

Fig. 1 Three-Pass Standard Water-Tube Marine Boiler for Wood Ships

A great advantage of the design made by the Emergency Fleet Corporation came from the fact that all of the boilers for the wood ships using the first 706 boilers were alike and differed only slightly from the later orders of 646 which were all alike. The differences in the design came from changing the number of baffles from three to four and in using Key handhole caps instead of plugs with copper ferrules.

Presented at the Annual Meeting, New York, December 1919, of The American Society of Mechanical Engineers. The paper is here printed in abstract form. Copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

Description of the Boiler

The boiler as first designed is shown in Fig. 1, and as later modified in Fig. 2. It consists of two headers, each composed of two plates, known as tube and handhole plates, connected at the edges by channel-shaped pieces, the two headers being connected by tubes which furnish most of the heating surface and form means of fastening the headers together. The front header is surmounted by a steam drum which is riveted to both the drum and header. Holes in the bottom of the drum within the limits of the saddle furnish the means of connecting the interior of the drum and header, and two rows of so-called circulating tubes connect the upper part of the back header with the drum and serve to conduct the steam to it.

The header plates are stayed together by means of hollow iron staybolts, the holes being $^3/_4$ in. in diameter. The handholes in the first 706 boilers were closed by means of tapered plugs surrounded by thin copper ferrules. The plugs had a threaded shank secured by a yoke and nut as is usual for handhole plates. It was soon recognized, however, that the Key cap is better and the 646 boilers afterward ordered were provided with them.

The drum was made with the longitudinal joint where the circulating tubes enter, there being here an inside and an outside strap. The tubes pass through the shell and both straps, but the holes in the shell are larger than the tubes and the expanding occurs only in the straps. The drum is reinforced at the bottom by means of an inside strap in order to make up for the plate section cut away by the holes already referred to.

The tubes are seamless hot-rolled steel. The baffles are of the longitudinal type, of which the first boiler tested had three, forming three passes as shown in Fig. 1. After some testing it was decided that it was best to place the lowest baffle on the lowest row of tubes in order to render the second and third rows of tubes more active as heating surface. In the first design these tubes did little good except such portions of them as extended across the first pass. When this change was being made it was seen that there was room for four passes and accordingly four baffles were inserted. This rendered the boiler somewhat more efficient, especially at the higher powers, and made the efficiency curve flatter than in the case of three passes.

In the three-pass boiler the upper baffle was of steel plate and the others of tiles, but in the four-pass boiler the two upper baffles were of steel and the indications are that the others might be of steel if the tubes were sufficiently near together to touch the baffles on both sides and thus conduct the heat from them into the water. In the four-pass boiler tested the baffle next to the lowest was made of steel, and although it merely rested on the tubes it stood the service. The outer end of the lowest baffle of this boiler was made of steel and although it was in contact with tubes on the bottom only it stood the service fairly well. Experience with steel baffles in a Foster boiler tested at Burlington, Iowa, showed that they stood so well that they were adopted in all positions in this boiler. By using steel baffles in the four-pass boiler, 34 more tubes can be put in. The four-pass boiler is shown in Fig. 2.

In the drum of the standard boiler there is the usual deflector plate which prevents the steam, as it comes through the circulating tubes, from passing across the drum and compels it to pass to the ends. This deflector was removed for a time and no difference in the behavior of the boiler could be observed except that the water as it appeared in the glasses was livelier. In a seaway other advantages might appear.

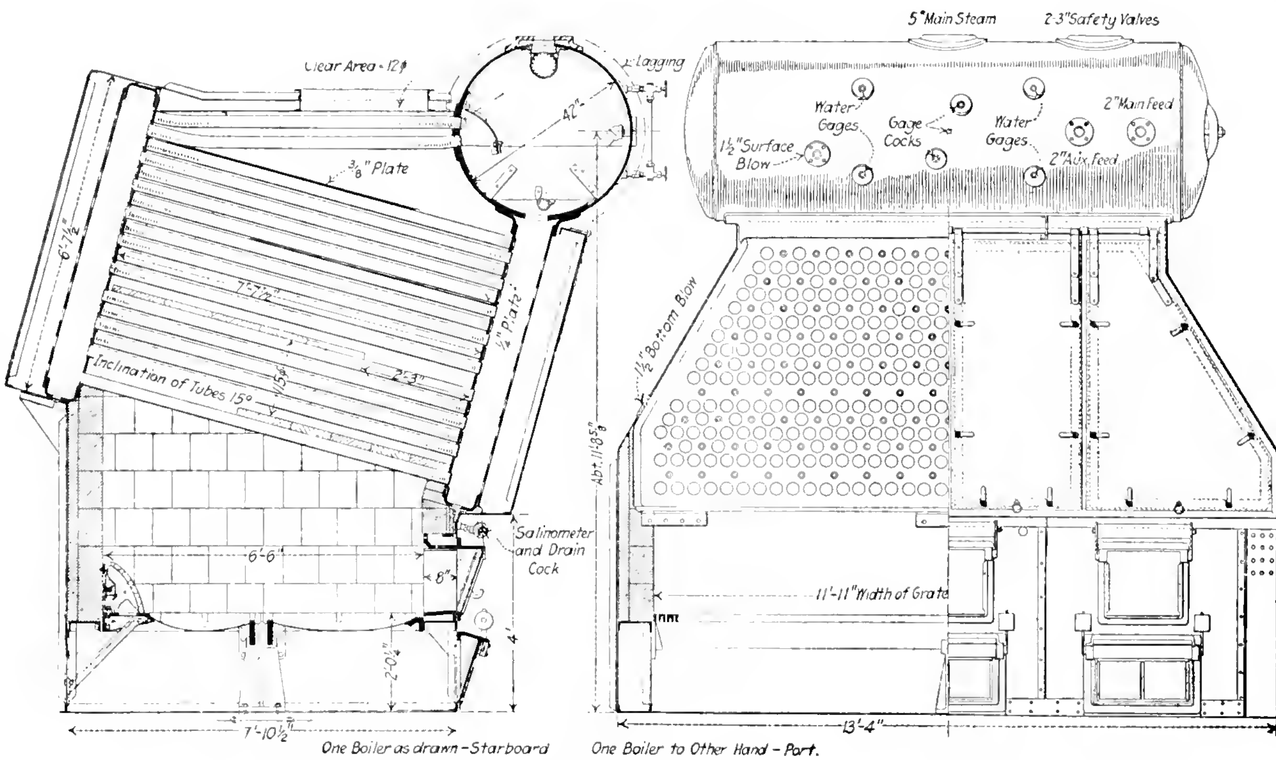

Fig. 2 Four-Pass Standard Water-Tube Marine Boiler for Wood Ships

In the top of the drum a perforated drypipe is used having eighty-eight $^3/_8$-in. holes. This is a rather small area and it proved to have an important effect in separating moisture from the steam. This was determined by testing the boiler both with and without the drypipe. The reduction in the pressure of the steam in passing from the drum to the steam nozzle was determined by a mercury manometer. At ordinary rates of working the loss in pressure amounted to little, but when forcing it amounted occasionally for short periods to six or eight inches of mercury.

The casing of the boiler is built up of steel plates joined together by external and internal shapes secured to a channel frame at the bottom which rests on the keelson of the ship. At the front there are two vertical channels acting as columns which are secured to the channels and bolted to tees riveted to the bottom of the header. The rear header of the boiler rests on a shelf formed in the casing, and the casing is a close fit around the rear header. The front columns form the only rigid connection to the channel base, and the boiler is free to slide in the rear part of the casing. The channel base is bolted to the bottom of the ship and the casing holds the boiler firmly in place and is amply able to prevent rolling or pitching at sea or in a collision, all of which has been proved by

experience, including the latter, even without rolling or collision braces.

The front and back of the casing have sheet-iron doors covering the headers, and the space between the headers and doors is sufficiently great to accommodate soot blowers. These blowers, which are found to be of great importance, blow through the hollow staybolts.

The boilers are equipped with bottom and surface blows, a duplex safety valve, two water glasses, a set of three gage cocks, main and auxiliary feeds, a salinometer cock, a basket of zinc plates and an internal perforated feedpipe.

In the three-pass boiler there are four fire doors and four ash-pit doors, but in the four-pass boiler there are three of each. These doors are of the in-swinging type. Above each door there is a hollow perforated lintel with air freely entering through holes in the casing and on the sides of the doors there are perforated jambs with air supplies from the outside. All of these air openings are not only useful in protecting the parts from burning, but promote economy, for it is found that none too much air enters the furnace through them.

The grates are of the fixed type of double bars in two lengths, and have ½-in. air and ½-in. iron spaces.

Across the back end of the furnace there is a cast-iron bridge wall with narrow air spaces which saved nearly 2 per cent of coal, perceptibly diminished smoke, improved the gas analyses, saved the back brickwork and reduced the time and labor of cleaning the fires nearly 50 per cent.

Dimensions of Boiler

The following are the leading dimensions of the boiler:

Width of casing at floor level	13 ft. 4 in.
Length of casing at floor level	7 ft. 10½ in.
Height of center of drum above floor	11 ft. 8⅝ in.
Thickness of header plates	11/16 in.
Width of water spaces of headers	8 in.
Outside diameter of tubes	3 in.
Exposed length of tubes between headers	7 ft. 7½ in.
Number of tubes between headers	388
Number of tubes between rear header and drum	21
Inside diameter of drum	42 in.
Thickness of drum plates	⅝ in.
Width of furnace	12 ft.
Depth of furnace	6½ ft.
Height of furnace at center	3 ft. 8 in.
Firing doors	15 in. by 18 in.
Width of grate	11 ft. 11 in.
Depth of grate without bridge wall	6 ft. 6 in.
Depth of grate with bridge wall	5 ft. 8 in.
Grate area without bridge wall	77½ sq. ft.
Grate area with bridge wall	67½ sq. ft.
Heating surface, fire sides	2518 sq. ft.
Thickness of brick lining	8½ in.

The Evaporative Tests

In the beginning it was decided to use Georges Creek Cumberland coal from the Big View vein on all tests in order to have a standard coal of good and uniform quality, low volatile content, and high-fusing clinker.

It was also decided to make tests with fixed grates, shaking grates, firebox without a bridge wall, with the iron bridge wall already mentioned, a brick bridge wall covering the same area as the other, and several kinds of oil burners, using Mexican oil. Mexican oil was selected because that is the oil that will be used chiefly in future.

The three-pass boiler was erected with the baffles in the positions and of the lengths in the original drawing, but the first test showed that they were not sufficiently long. Several of the earlier tests were made with the grate of the full size, that is to say, without the iron or the brick bridge wall. By the addition of the iron bridge wall, admitting air around the fire doors, lengthening and otherwise changing the baffles, and studying the method of firing, the efficiency of the three-pass boiler was raised from about 60 per cent to about 71 per cent based upon dry coal, and to about 73 per cent based upon combustible. The efficiency of the four-pass boiler was about 72½ per cent based on dry coal, and based upon combustible exceeded 74 per cent on two tests. These tests were made when firing by hand, but when using the "Type E" stoker higher efficiencies were obtained.

TABLE 1 RESULTS OF TESTS OF FOUR-PASS BOILER EQUIPPED WITH TWO-TYPE "E" UNDERFEED STOKERS

1	Date, 1919	April 8	April 9	April 13	April 12
2	Duration, hr.	24	24	22	24
	Dimensions and Proportions

Results of Tests

In the complete paper four tables are given which show the general results of the tests of the three-pass and four-pass boilers under all of the conditions, both with hand and stoker firing. Those for the four-pass boiler with stoker firing are given below in Table 1. No results with oil firing are given because those tests are now in process.

While it was intended to test the boiler at the marine rating in general, which is to evaporate 6 lb. of water per sq. ft. of heating surface per hr., other rates were used, especially with the four-pass boiler. In the test of Dec. 18, 1918, the four-pass

boiler (hand-fired) was worked at 131 per cent of marine rating and 229 per cent of land rating. Even at this high rate the efficiency was about 71 per cent, and but little below that of lower rates. With the stokers the boiler was operated at 162 per cent of marine rating and 282 per cent of land rating. At this rate the evaporation was 9.72 lb. per sq. ft. of heating surface per hr. from and at 212 deg., and the efficiency was 72.3 per cent based upon combustible. Based upon the total area of grate for hand firing the coal consumption was at the rate of 29.6 lb. per sq. ft. of grate per hr. The coal consumption per sq. ft. of heating surface per hr. on this test was 0.92 lb. The test of April 8 (Table 1), shows a very high efficiency, but this is open to suspicion because the heat balance did not work out quite properly, due, it is thought, to an error in the coal weight of one hour. All of the tests given in Table 1, were of 24 hr. duration each, excepting that of April 13, which was for 22 hr.

The conclusion arrived at is that the boiler is of excellent efficiency, and that the four-pass boiler is well adapted to overloads. This is due to its having four passes. The only defect of the four-pass boiler is, as might be expected, that there is considerable absorption of draft in the passes, and the greatest loss was in the third pass from the bottom. The third baffle was lowered one tube, but the great loss continued, and it was then restored to its former position.

Among the experiments tried with this boiler were those to determine whether the number of circulating tubes and the number of holes in the bottom of the drum connecting its water space to that of the front header were excessive. Half of them, together and separately, were closed, but no effect could be observed. The conclusion was that an unnecessary number of such tubes and openings are used in this type of boiler, and by reducing them the drum will be made a safer structure.

The quality of the steam was most satisfactory when the water was carried at a proper level and it was necessary to carry it near the top of the glass before the limit of a throttling calorimeter was reached. The quality of the steam is given in all of the tables.

PART 2 PRELIMINARY TESTS

By Henry Kreisinger

This part of the paper presents some of the results of special investigations conducted by the Fuel Section of the Bureau of Mines in connection with the tests of the three-pass and four-pass marine boilers shown in Figs. 1 and 2. Outline diagrams illustrating the methods of testing these boilers are given in Figs. 3 and 4. The special investigations consisted of the study of combustion in the furnaces and the temperature of gases as they flow through the boiler. This study was carried on by the analysis of samples of furnace gases collected at various points in the setting.

Fig. 3 is a diagram of the three-pass boiler as originally designed. After the first few tests the baffles were extended, making smaller the gas passages between the ends of the baffles and the water legs. Other changes were also made as the investigation indicated the need for them. The points at which gas samples were collected are indicated by the small circles designated by the capital letters A, A', B, C, D, E, F, G, H, and I.

Admission of Air Over Fuel Bed

During the first six tests a large amount of combustible gas passed out of the furnace and either burned at the base of the stack, causing high flue-gas temperature, or escaped unburned. It was apparent, therefore, that more air had to be admitted over the fuel bed and better means provided for mixing it with the combustible. Admission of air through the holes in the fire being undesirable because the size of holes cannot be controlled, a number of ½-in. holes were accordingly made in each firing door; the small opening in the first baffle at I was closed and the baffle extended, making the gas passage between the end of baffle and the rear water leg 36 in. This had the effect of causing the air admitted through the firing door to flow farther to the rear of the furnace and thus facilitate better mixing with the combustible gases.

In addition to these changes, Wager's bridge wall was installed to supply additional air to the rear part of the furnace. See Fig. 4. The bridge wall consists of a large number of cast-iron bars

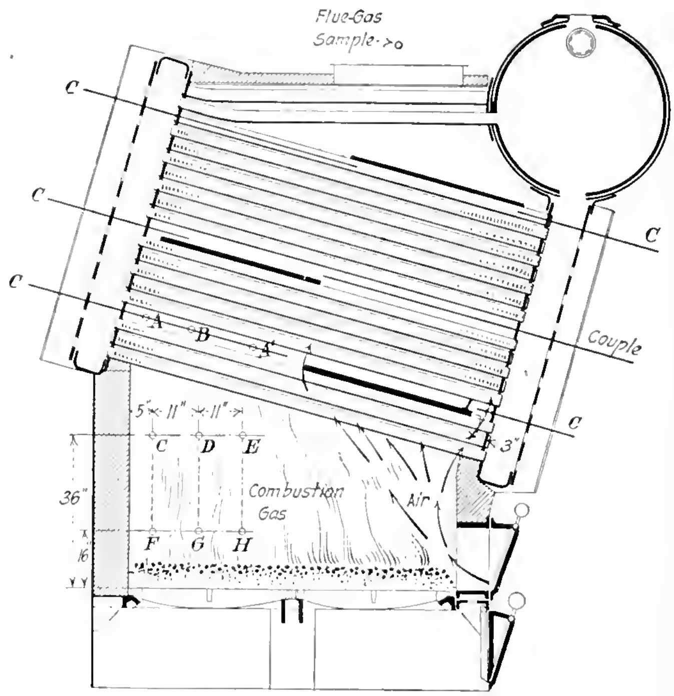

Fig. 3 Diagram Showing Method Used in Testing Three-Pass Type of Boiler

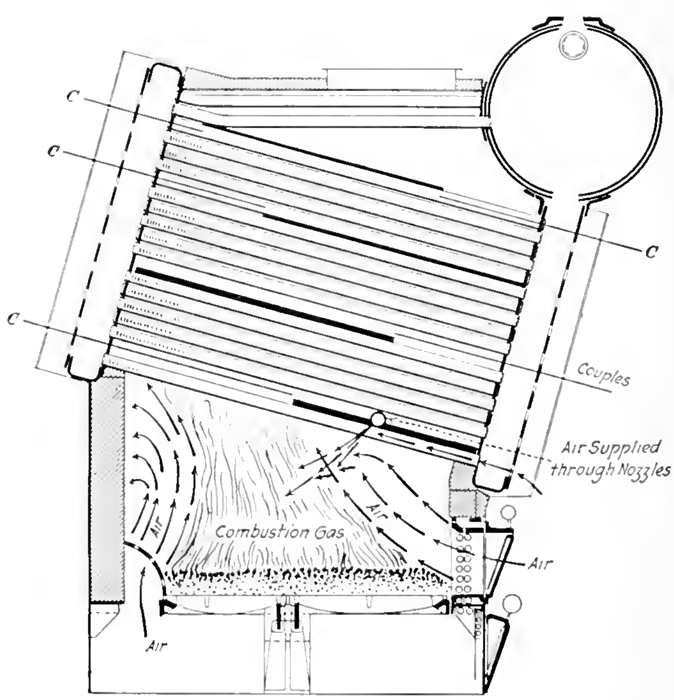

Fig. 4 Diagram Showing Four-Pass Type of Boiler With Facilities for Introducing Air Over Fuel Bed

placed against the rear wall of the furnace, and forms a structure similar to a plain grate. The air passes into the furnace through narrow slots between the bars, and is regulated by the thickness of the fuel bed near the bridge wall. The thicker the fuel bed the greater is the area of the air spaces covered with coal, and the

smaller is the quantity of air flowing into the furnace. The air enters in a large number of thin streams.

With the air admitted through the firing door and through the bridge wall, the combustible gases rising from the fuel bed are squeezed between two streams of air coming in from two different directions and the mixing is greatly aided. The direction of the streams of air admitted over the fuel bed under these conditions is indicated in Fig. 4. The total area for admission of air over fuel bed was about 160 sq. in., or approximately 2 per cent of the grate area.

Mixing of Air and Combustible by Different Methods of Admitting Air over Fuel Bed

In order to determine the effect on the mixing and combustion of various methods of admitting air over the fuel bed, a set of six gas samples was taken in the furnace and two in the gas passage between the rear water leg and the end of the first baffle. The points at which these samples were taken are indicated in Fig. 3 by the small circles designated by the capital letters A to H. The analyses of these gas samples are shown graphically in Fig. 5.

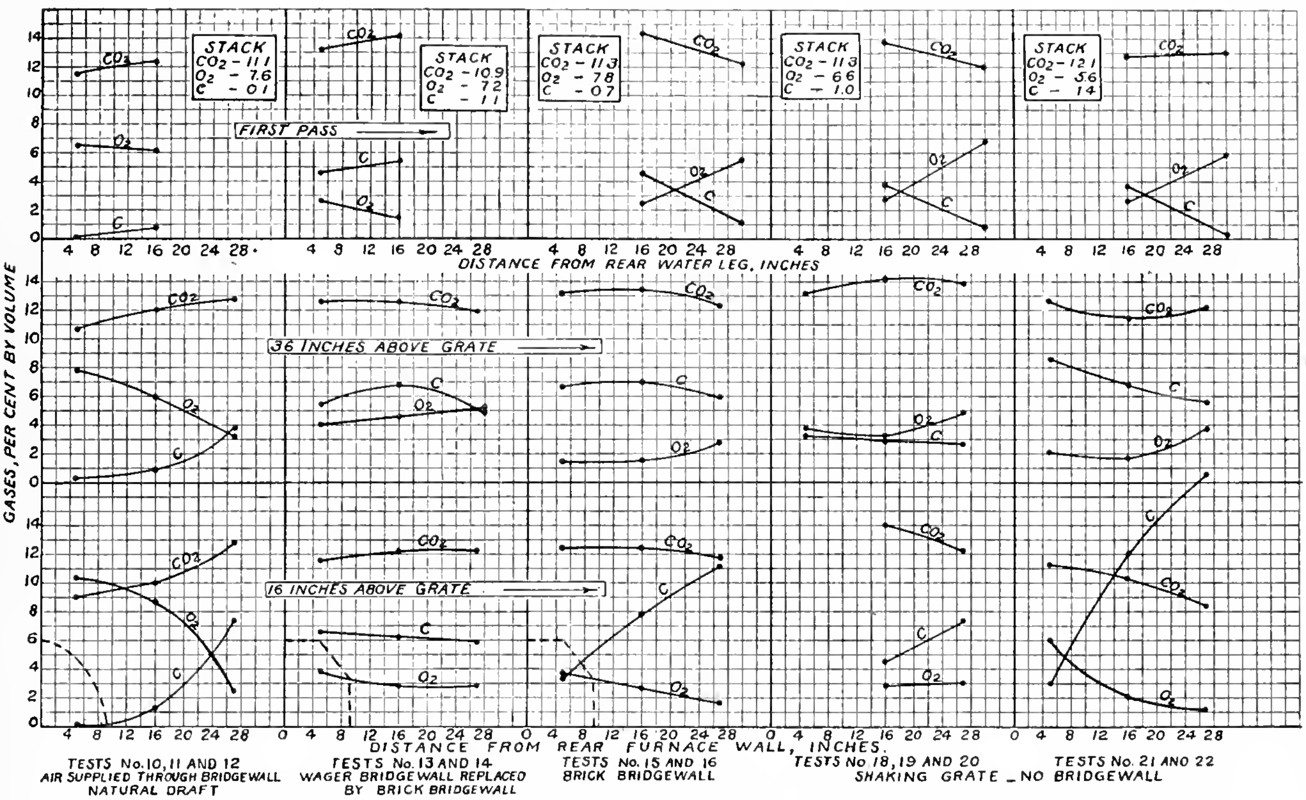

Fig. 5 Composition of Gases in Furnace with Various Methods of Introducing Air Over Fuel Bed and the Effectiveness of Mixing. Three-Pass Water-Tube Boiler

Analyses of Gas Samples Shown by Diagrams in Fig. 5

Fig. 5 shows five groups of tests, each group being represented by one of the five vertical charts. The furnace conditions under which each group of tests was made are indicated by the label at the foot of each chart. Each of the three large squares in each vertical chart gives the samples taken at one elevation above the grate, e. g., the lowest square gives the analyses of samples taken 16 in. above the grate.

The abscissæ of the lower two squares give the distance of sampling from the rear of the furnace wall; and those of the highest square give the distance of the point of sampling from the rear water leg. The ordinates give the percentage of the gases. The points giving the percentage of each gas at one elevation above the grate are connected by a smooth curve, principally to make the chart clearer. The analysis of the flue gases collected at the same time at the base of the stack is given in the small tables in the top squares. The location where the stack gases were taken is also indicated in Fig. 3.

The first group of tests gives the analysis of the furnace gases when the air over fuel bed was admitted through the firing door and through Wager's bridge wall. The chart is intended to show how the air admitted through the bridge wall mixes with the gases and affects combustion. The sample taken 16 in. above the grate and 5 in. from the rear wall shows practically no combustible gas, over 10 per cent of free oxygen, and about 9 per cent CO_2. The sample taken 27 in. from the rear wall shows about 7½ per cent of combustible, only 2½ per cent of oxygen, and nearly 13 per cent of CO_2. Apparently at this level the oxygen admitted through the bridge wall did not have a chance to penetrate far enough toward the center of the furnace to help in the combustion. The sample taken 36 in. above the grate and 5 in. from the rear wall shows less than 8 per cent of oxygen, a trace of combustible gas, and nearly 11 per cent CO_2. At this elevation above the grate the sample taken 27 in. from the rear wall shows less than 4 per cent combustible gas, about 3 per cent of oxygen, and nearly 13 per cent of CO_2. Comparison of the analyses of samples taken at these two elevations indicates that the air admitted through the bridge wall, in rising about 2 ft., has penetrated to a considerable depth into the stream of combustible gases rising from the fuel bed.

In the first pass the composition of the gases in the first 16 in. from the rear wall is nearly uniform, showing that the air admitted through the bridge wall mixed well with the combustible gases and did not pass out of the furnace in a separate stream. The stack gases showed, at the same time, 11.1 per cent CO_2 and only 0.1 per cent combustible, indicating a good combustion.

The second and third vertical charts give the analyses of gases of two groups of tests made with Wager's bridge wall replaced by a brick wall of similar shape, but having no provision for air admission. The shape of this brick bridge wall is shown by the dotted lines in the lower left-hand corners of the lowest squares. In both of these groups of tests the percentage of oxygen in the

samples taken in the furnace is low, and the percentage of combustible gases is high, clearly indicating the lack of sufficient air supply. The stack gases of these two groups of tests contain a considerable amount of combustible, although the percentage of free oxygen is about the same as it was in the groups of tests made with Wager's bridge wall. Although the air found its way into the furnace it was not introduced close enough to the fuel bed to bring the combustion nearly to completion before the gases left the furnace. In the second group of tests the gases passed out of the furnace still containing about 5 per cent of combustible, and in the third group they contained 3 per cent of combustible gas. It should be noted, however, that in the third group of tests the samples collected in the first pass were taken farther away from the rear wall, and their analyses show the presence of the air admitted through the firing doors, the sample taken 30 inches from the rear water leg showing more free oxygen than the sample taken only 16 in. from it.

The tests of the fourth and fifth group were made with a shaking grate and no bridge wall of any description. The samples taken 16 in. above the grate indicate that a small quantity of air passed into the furnace close to the rear wall, but it was not sufficient to have much effect on the combustion. The percentage of combustible remained high even when the gases reached the first pass. In these two groups of tests the samples taken in the first pass 30 in. from the rear water leg show the effect of the air admitted through the firing door. The stack samples show over one per cent of combustible gas and lower oxygen than either of the three previous groups. The lack of proper admission of air over fuel bed is clearly indicated in these last two groups of tests. The advantage of air admission through Wager's bridge wall was clearly demonstrated and it was therefore used on all subsequent tests with hand-fired furnaces.

Effect on Combustion of Different Methods of Admitting Air Over Fuel Bed

In a similar way the effect on combustion of various methods of admitting air over the fuel bed was shown by means of tests made on the four-pass standard boiler of Fig. 4. The samples were taken similarly to those on the test with the three-pass boiler, the points at which they were taken being indicated by the abscissæ and the label in each square.

The first group of tests was made with the air supplied over the fuel bed, through the firing door, and through Wager's bridge wall. Sixteen inches above the grate the admission of air through the bridge wall was apparent only in the sample taken 5 in. from the rear wall. Samples taken 36 in. above the grate and in the first pass indicated fairly uniform distribution of the air but an insufficient quantity of it. Apparently during these tests the fuel bed near the bridge wall was carried too thick. Had a thinner fuel bed been carried the combustible in the first pass would have been much lower.

The second group of tests was made with the air over fuel bed being supplied with natural draft, through Wager's bridge wall, and through the firing doors, and in addition to this also under pressure of 2 in. of water through 17 half-inch nozzles from a $3\frac{1}{2}$-in. pipe placed between the first and second rows of tubes, as indicated in Fig. 4. The object of the air forced in through these nozzles was to force the air supplied through the firing door into the center of the stream of combustible gas rising from the fuel bed and cause intimate mixing. The action of these nozzles is shown in Fig. 4. The samples collected in the first pass showed fairly uniform mixture and lower percentage of combustible than was obtained when the air was admitted only through the bridge wall and through the firing door. However, the amount of combustible was a little too high, indicating that not quite enough air was admitted.

The third group of tests was made with air admitted through the firing door, and with natural draft and air admitted through Wager's bridge wall under a pressure of $\frac{3}{8}$ in. of water. In this case the air admitted through the bridge wall tended to flow in a separate stream close to the rear wall without penetrating very deep into the stream of combustible gas. The analysis of the samples taken in the first pass showed that the excess of air decreases as the distance from the rear water leg increases. On the whole, the admission of air through the bridge wall under pressure proved to be undesirable in this type of furnace. The tests represented by the second group showed conditions most favorable to complete combustion. However, the installation of the nozzles entails undesirable complications in boiler plants of ships. The conditions represented by the first group recommend themselves by their simplicity and effectiveness when attention is given to the proper thickness of fuel bed next to the bridge wall.

Temperature Measurements

The temperatures were measured with thermocouples inserted into the setting through the hollow staybolts and moved across the gas passages, as indicated by the straight lines labeled "couples," or C, in Figs. 3 and 4. The temperatures were measured across the spaces between the ends of the baffles and the water legs.

[The complete paper concludes with a discussion of charts showing the temperature measurements at various distances from the front and rear water legs of both the three-pass and four-pass boilers, the former first with short baffles and then with long baffles, the latter with long baffles. A figure is also given which shows the average temperature drop of the gases along their path of travel through the four-pass boiler. — EDITOR.]

Government Insurance for Ex-Service Men

A series of decisions issued by the Director of the Bureau of War Risk Insurance with the approval of the Secretary of the Treasury providing for more liberal conditions of reinstatement of lapsed or canceled insurance, should prove of interest to all ex-service men. The provisions of Treasury Decision No. 47, allowing eighteen months from the date of discharge for reinstatement upon payment of only two months' premiums on the amount of insurance to be reinstated, are still retained, but that decision is liberalized by a new provision that men out of the service are permitted to reinstate by merely paying the two months' premiums without making a statement as to health at any time within three calendar months following the month of discharge. After the three months following the date of discharge have elapsed, a statement from the applicant to the effect that he is in as good health as at the date of discharge or at the expiration of the grace period, whichever is the later date, will be required together with a written application for reinstatement and the tender of two months' premiums on the amount of insurance he wishes to reinstate.

In order to give all former service men whose insurance has lapsed or been canceled, a fair chance to reinstate their insurance, including men who have been out of the service eighteen months or more, and who are therefore barred from reinstatement under the former ruling, a special blanket ruling is made which allows all ex-service men to reinstate their insurance before December 31, 1919, provided that each applicant is in as good health as at date of discharge or at expiration of the grace period, whichever is the later date, and so states in his application. Of course it is necessary that he tender the two months' premiums on the amount of insurance he wishes to reinstate.

Service men who reinstated their insurance by payment of all back premiums prior to July 25, 1919, when the decision requiring payment of only two months' premiums went into effect, upon written application to the Bureau may have any premiums paid in excess of two applied toward the payment of future premiums. For example, if after a policy had elapsed for six months, a man reinstated and paid six months' premiums instead of two, he may secure credit for four months' premiums. The provisions for reinstatement do not, however, protect a man until he actually reinstates. If he waits he may not be in as good health as he was at the time of discharge and consequently may not be able to secure reinstatement.

Flow of Water Through Condenser Tubes

By WILLIAM L. DE BAUFRE,[1] LINCOLN, NEB., AND MILTON C. STUART,[2] ANNAPOLIS, MD.

In this paper the authors give particulars regarding an extended series of tests recently conducted at the United States Naval Engineering Experiment Station at Annapolis, Md., to determine the friction loss of water flowing through ⅝-in. No. 18 gage standard condenser tubes. The investigations covered variable velocities, water temperatures, and tube length, as well as the effect of both fresh and salt water. The results obtained are presented in tabular form and from them a general formula has been derived which gives the total drop in pressure due to entrance and exit losses and to frictional resistance within the tube.

THERE was conducted recently at the U. S. Naval Engineering Experiment Station, Annapo'is, Md., an investigation upon the friction loss of water flowing through ⅝-in. standard condenser tubes of No. 18 gage, 0.522 in. in internal diameter. The principal variables were velocity and temperature of water, and tube length. The investigation also covered the variation in friction loss with clean tubes and tubes as received, and the effect of fresh and salt water. The computations were made in such a manner that losses at the tube ends and along the tube could be separated, the results being expressed in a general formula.

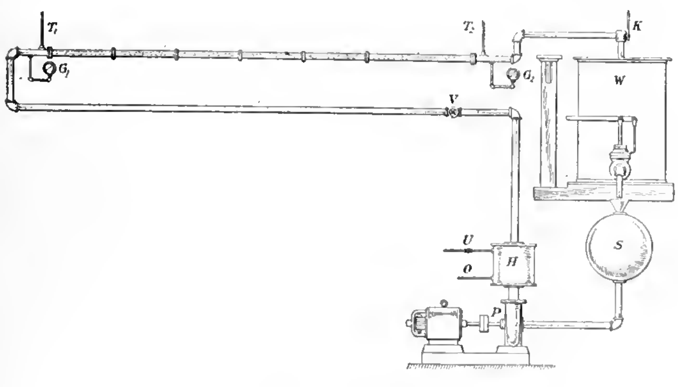

Fig. 1 Diagram of Test Apparatus

A number of sections of 3-in. iron pipe were assembled with flanges as indicated in Fig. 1. A corresponding number of lengths of ⅝-in. condenser tubing were obtained, and two brass blank flanges prepared to serve as tube sheets. These tube sheets could be inserted between any two pairs of flanges, thus enabling tube lengths of approximately 5, 8, 11, 14, 17, and 20 ft. to be tes'ed. The tubes were held in place by ordinary screwed glands in the tube sheets, and packed with cotton held between two fiber washers as shown in Fig. 2. They were supported by sheet-iron disks between the intermediate pairs of flanges.

Referring to Fig. 1, water from the storage tanks S was pumped by the motor-driven centrifugal pump P through the heater H to the condenser tube indicated by the dotted lines. From the condenser tube the water was discharged into the two tanks W, where it was weighed before being discharged into the storage tank S below. The centrifugal pump P ran at constant speed, the rate of flow of water being regulated by valve V. The temperature of the water as indicated on thermometers T_1 and T_2 was regulated by the valve U admitting steam to the heater H. The condensed steam was discharged through O into a trap not shown. Gages G_1 and G_2 served to measure the pressures before and after the tube.

[1] Professor, Department of Mechanical Engineering, University of Nebraska. Mem.Am.Soc.M.E.

[2] Mechanical Engineer, U. S. Naval Engineering Experiment Station. Mem.Am.Soc.M.E.

Presented at the Annual Meeting, December 2 to 5, 1919, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. The paper is here printed in abstract form. Copies of the complete paper may be obtained at a nominal price. All papers are subject to revision.

With each tube length a number of runs were made with distilled water at temperatures of 85, 100, 130, 160, and 190 deg. fahr. and with rates of flow up to about 7500 lb. per hr. corresponding to

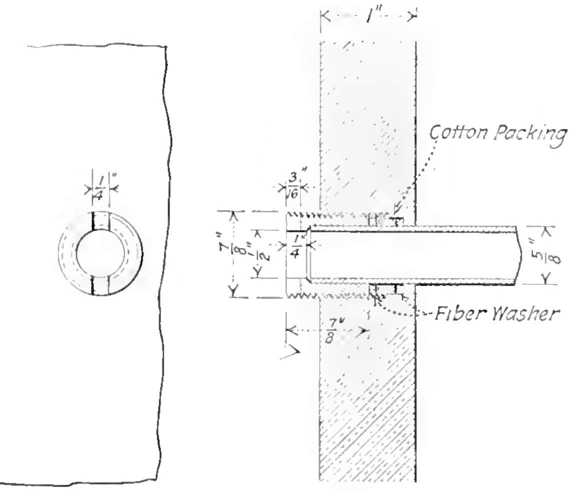

Fig. 2 Method of Securing Condenser Tube in Tube Sheet

a velocity of about 22 ft. per sec. A few runs were first made with the tube in the condition as received and at 100 deg. fahr. The tube was then cleaned by pushing through it a small rag which had been soaked in kerosene. After cleaning, the complete set of runs, numbering in all 337, was made and the results obtained are given in Table 1 of the complete paper. In order to check the constancy of the results from day to day, a certain pressure drop and rate of flow were selected as a standard at each temperature.

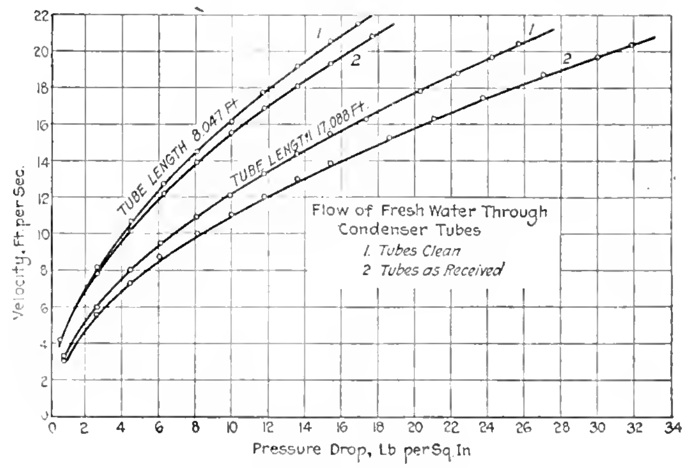

Fig. 3 Curves Showing the Effect of Cleaning Tubes

and the run under these conditions was repeated when starting up in the morning and just before shutting down at night.

After completing the runs with distilled water, which began with the longest tube and ended with the shortest one, the longest tube was again installed in order to make runs with salt water and compare the results with the data obtained for fresh water. A few runs were repeated with fresh water and then duplicated with salt water at both 70 and 100 deg. fahr. The salt water was prepared by adding to the fresh water one thirty-second of its weight of salt, in order to approximate the normal density of sea water

For the several tube lengths it was decided to use entirely different tubes rather than to take one long tube and cut off parts to obtain the shorter tubes. The results therefore include the variations that are liable to occur with commercial tubes of this size and gage.

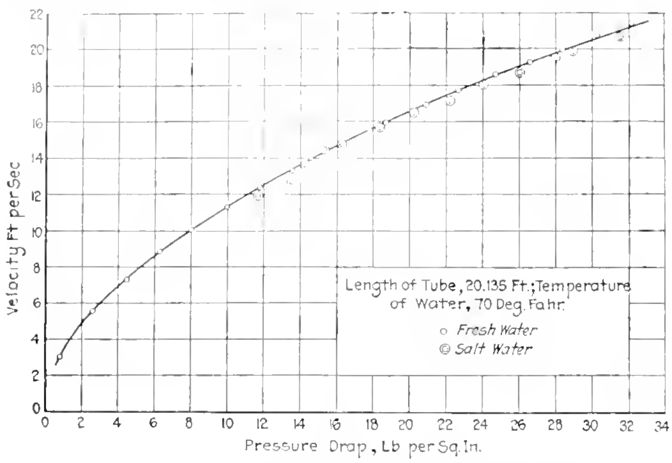

FIG. 4 CURVES SHOWING A COMPARISON OF THE EFFECTS OF SALT AND FRESH WATER FLOWING THROUGH CONDENSER TUBES

The effect of cleaning the tubes is shown in the curves of Fig. 3. and similar curves for four other tube lengths are given in the complete paper. As received from the manufacturers condenser tubes apparently offer a resistance to the flow of water 10 to 20 per cent greater than after cleaning them. A more thorough cleaning would probably have still further reduced the frictional resistance. To approximate actual condenser conditions it was deemed advisable

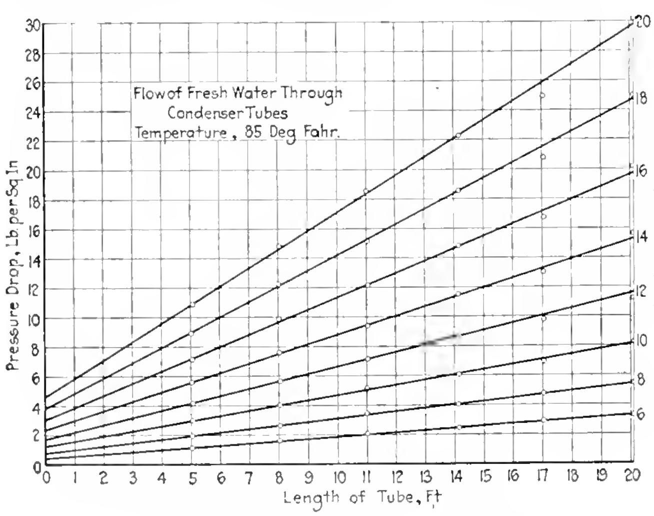

FIG. 5 CURVES SHOWING THE RELATION OF PRESSURE DROP TO TUBE LENGTH WITH WATER AT 85 DEG. FAHR.

to add about 20 per cent to the tabulated results obtained with cleaned tubes.

The curves of Fig. 4 show that the resistance with salt water having a salinity of one-thirty-second, equivalent to that of sea water, was practically the same as with fresh water. Consequently no further corrections are necessary to apply the results obtained in this investigation to condenser conditions on board ship.

In order to separate the loss of head at entrance and exit from the frictional resistance through the tubes, there were plotted in Figs. 5 to 7, inclusive, the pressure drop versus the tube length for various velocities. The points plotted in these figures were not taken directly from Table 1, but from faired curves (not included in this paper) of all runs made. By prolonging the straight lines for each velocity back to zero tube length, there was obtained the loss of head, or pressure drop, at entrance and exit.

The total drop in pressure of water flowing through a condenser tube may be expressed by the formula —

$$P = P_1 + P_2$$
$$= K_1 V^n + K_2 L V^m$$

where

P = total drop in lb. per sq. in.
P_1 = drop in lb. per sq. in. due to entrance and exit losses
P_2 = drop in lb. per sq. in. due to frictional resistance within the tube
n = velocity exponent for entrance and exit losses
m = velocity exponent for frictional resistance within the tube
L = tube length in ft.
K_1 = factor for entrance and exit losses, and
K_2 = factor for frictional resistance.

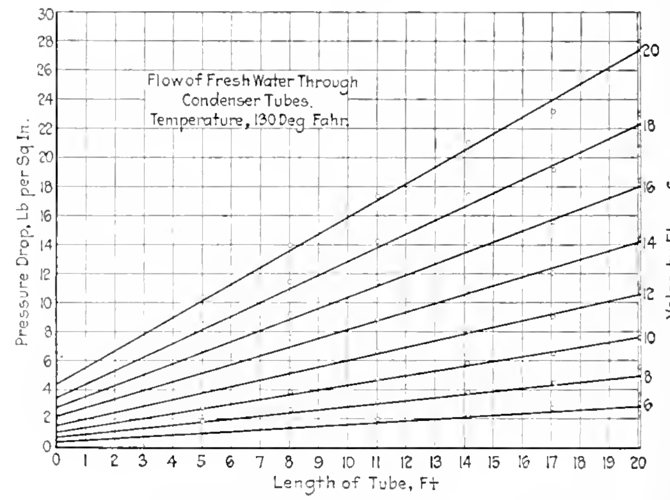

FIG. 6 CURVES SHOWING THE RELATION OF PRESSURE DROP TO TUBE LENGTH WITH WATER AT 130 DEG. FAHR.

Theoretically, the entrance and exit losses should vary as the square of the velocity. This is confirmed experimentally by the curves plotted in Figs. 8 to 10, inclusive, from the pressure drops in Figs. 5 to 7, corresponding to zero tube length. The velocity

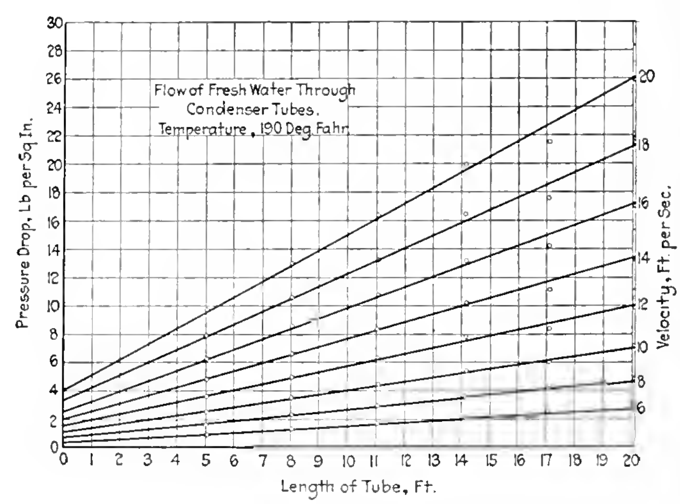

FIG. 7 CURVES SHOWING THE RELATION OF PRESSURE DROP TO TUBE LENGTH WITH WATER AT 190 DEG. FAHR.

exponent for the frictional resistance within the tube should lie between 1 and 2. The curves in Figs. 8 to 10 for the loss per foot of tube length were obtained by plotting the slopes of the straight lines drawn in Figs. 5 to 7. The exponent in all cases was found to be 1.83.

The following values of K_1 and K_2 were taken from the curves of Figs. 8 to 10, inclusive, as well as from two other figures in the complete paper for temperatures of 100 deg. and 160 deg.

Temperature, deg. fahr.	K_1	K_2
85	0.0123	0.0052
100	0.0111	0.0051
130	0.0107	0.0048
160	0.0101	0.0047
190	0.0097	0.0046

These values are plotted in Fig. 11.

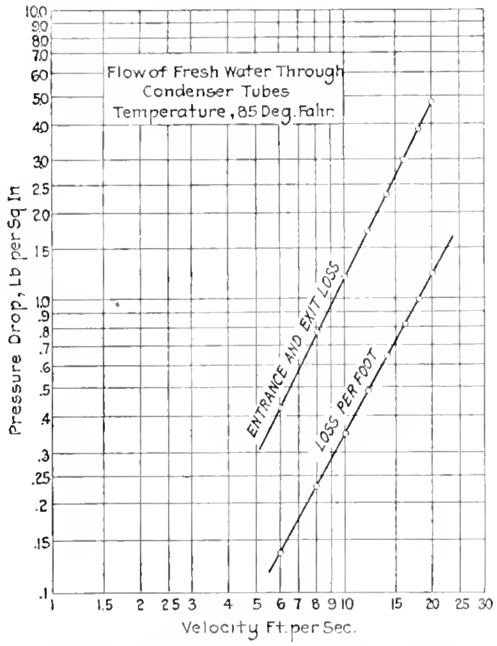

FIG. 8 LOGARITHMIC PLOTTING OF PRESSURE DROP VERSUS VELOCITY FOR A WATER TEMPERATURE OF 85 DEG. FAHR.

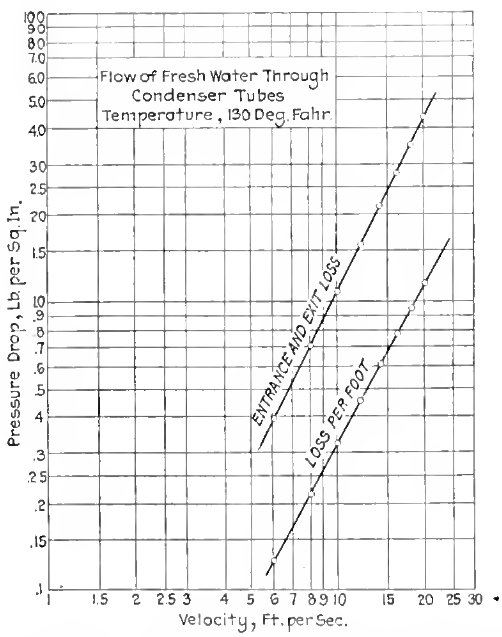

FIG. 9 LOGARITHMIC PLOTTING OF PRESSURE DROP VERSUS VELOCITY FOR A WATER TEMPERATURE OF 130 DEG. FAHR.

For clean condenser tubes, standard $\frac{5}{8}$ in. outside diameter, No. 18 gage 0.0345 in. thick, and for an average water temperature of 90 deg. fahr., we may write

$$P = 0.0118\ V^2 + 0.0051\ LV^{1.83}$$

where P is the total loss in pounds per square inch; V is the velocity in feet per second; and L is the tube length in feet. With very dirty tubes the entrance and exit losses would undoubtedly be unchanged, but the loss per foot would be greater. Assuming the latter to be increased 20 per cent for condenser tubes in the ordinary condition, for standard $\frac{5}{8}$-in. diameter tubes No. 18 gage we may write —

$$P = 0.0118\ V^2 + 0.0061\ LV^{1.83}$$

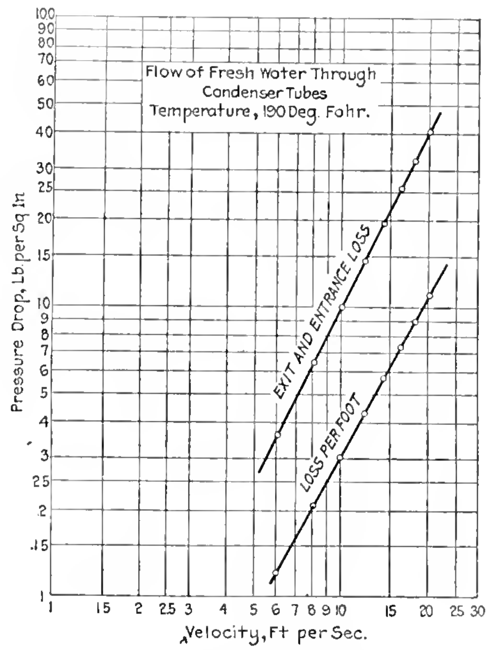

FIG. 10 LOGARITHMIC PLOTTING OF PRESSURE DROP VERSUS VELOCITY FOR A WATER TEMPERATURE OF 190 DEG. FAHR.

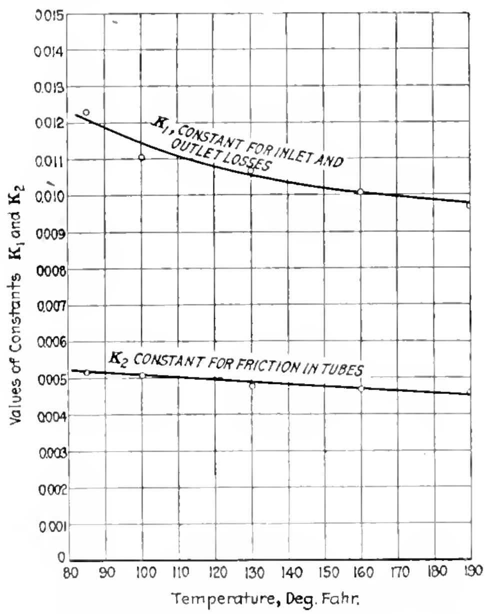

FIG. 11 CURVES SHOWING THE RELATION OF CONSTANTS TO THE TEMPERATURE OF WATER

Expressing the resistance in feet head of water, we have

$$H = 0.0274\ V^2 + 0.0141\ LV^{1.83}.$$

Pamphlets of instructions to enumerators for the fourteenth census have been sent to the 80,000 people engaged in this work. These instructions cover a special classification of technical engineers so that the returns will permit of their accurate enumeration. Special agents under the immediate direction of the Washington Census Bureau officials are in charge of the census of mines, quarries, forestry and manufactures.

ENGINEERING RESEARCH

A Department Conducted by the Research Committee of the A. S. M. E.

Research Problems

The attention of readers of MECHANICAL ENGINEERING is directed to two research problems proposed by the Bureau of Ordnance of the United States Navy. These problems are of a research nature in machine design, and the satisfactory solution of them would be of value for naval use.

Bibliography

The attention of the members of the Society is called to the Book Review Index published by the Carnegie Library of Pittsburgh, and also to the bibliographies which are published by the Library. The Director of the Library has consented to furnish the Research Committee with information regarding the work of the Library, and the Committee plans to transmit this information to the members through MECHANICAL ENGINEERING.

Correction

Referring to *Apparatus and Instruments A14-19* on page 890 of the November issue of MECHANICAL ENGINEERING, the Bulletin from the Bureau of Standards stated that the change in gages after a few months was from 2 to 6 one-thousandths of an inch. This should have been from 2 to 6 hundred-thousandths of an inch.

A — RESEARCH RESULTS

The purpose of this section of Engineering Research is to state the origin of research information which has been completed, to give a résumé of research results with formulæ or curves where such may be readily given, and to report results of non-extensive researches which in the opinion of the investigator do not warrant a paper.

Cement and Other Building Materials A11-19 Effects of Cal and Calcium Chloride on the Strength of Concrete. Calcium chloride is more effective than cal as an accelerator of the hardening of concrete. The effect varies with the concentration of the accelerator, the cement and the conditions of storage. There is some difference in the action of these during two or three days. The strength of treated concrete is invariably higher than that of the untreated. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Cement and Other Building Materials A12-19 Cement Drain Tiles and Alkali Soils. The Bureau of Standards, in continuing its work on cement drain tile and alkali soils, has found that there has been little change in the concrete blocks buried in alkali soil which were last inspected in 1916. Tiles which were then in good condition are in the same condition, and the same is true for the concrete blocks. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Electric Power A5-19 Corrosion of Cables. An investigation by the Bureau of Standards regarding the corrosion of power cables in St. Louis has shown that the corrosion was caused by electrolysis which occurred several years ago during the first few months after the cables were installed. The investigation has resulted in no saving to the company, but has demonstrated the importance of prompt attention to possible electrolysis. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Fire Protection A1-19 Gases Produced from Smoldering Fires in Small Chambers. A number of smoldering fires were built in the gas chamber of the Pittsburgh Station of the Bureau of Mines to show that it was possible to build up a concentration of 1 per cent of carbon monoxide in four hours. A quick smoldering fire or smoke seldom contains more than 1 per cent of carbon monoxide. Army gas masks remove irritating tar particles but do not remove the carbon monoxide. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Heat A3-19 Vapor Pressure of Lead Chloride. A complete table of vapor pressures and report on the investigation by L. E. Duschak and E. D. Eastman of the Bureau of Mines Station at Berkeley, Cal., is being printed. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Lubricants A1-19 Blending of Viscosity. The Bureau of Standards has prepared a diagram which corresponds with formulæ and experiments for the purpose of obtaining a certain viscosity from two oils of known viscosity. The viscosities are expressed in seconds as determined by the Saybolt viscosimeter. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Properties of Engineering Materials A6-19 Specific Gravity of Wood The Forest Products Laboratory has issued No. B-14 of its Technical Notes relating to the method of determining the specific gravity of timber by selecting chips from a boring or from a representative specimen of the wood. A specimen should not contain more than 25 cu. in. Forest Products Laboratory, Madison, Wis. Address C. P. Winslow, Director.

Wood Products A10-19 Waste Liquid Sulphur Dioxide from Smelters for the Manufacture of Sulphite Acid. The Forest Products Laboratory suggests the use of liquid sulphur dioxide from the stack gases of smelters for the manufacture of sulphite acid. When the freight charges on shipment permit this, it is advisable to utilize the waste gases. Forest Products Laboratory, Madison, Wis. Address C. P. Winslow, Director.

Wood Products A11-19 Moisture Resistance Tests for Coatings. In testing the water resistance of coated material it was found that for a 17-day exposure a humid atmosphere of 95 to 100 per cent humidity gave equal absorption with that obtained by immersing the specimen in water. Forest Products Laboratory, Madison, Wis Address C. P. Winslow, Director.

B—RESEARCH IN PROGRESS

The purpose of this section of Engineering Research is to bring together those who are working on the same problem for coöperation or conference, to prevent unnecessary duplication of work and to inform the profession of the investigators who are engaged upon research problems. The addresses of these investigators are given for the purpose of correspondence.

Cement and Other Building Materials B12-19 Reinforced-Concrete Floor Slabs. The Bureau of Standards has started an investigation on large flat slabs used in the floors of a new building for a manufacturing plant in Ohio. The slab is reinforced in the two-way system of reinforcement with hollow tile at certain intervals. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

Fire Prevention B1-19 Gases Produced from Carbon-Tetrachloride Fire Extinguishers. At the Pittsburgh Station of the Bureau of Mines an investigation is being made of the composition of gases from fire extinguishers using carbon tetrachloride together with the use of gas masks for protection against these vapors. Several men were recently overcome and subsequently died from inhaling such gases in a restricted place in a submarine. The investigation is under the direction of A. C. Fieldner and S. H. Katz. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Fuels, Gas, Tar and Coke B6-19 Economic Use of Fuels. The Bureau of Mines is investigating this subject at Pittsburgh under the direction of Henry Kreisinger. The work includes the use of fuels in steam boilers and furnaces, the use of powdered coal, the use of fuel in refining oils, the subject of heat transmission and the study of combustion in underfeed stokers. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Fuels, Gas, Tar and Coke B7-19 Solid Fuels. The Bureau of Mines is investigating the utilization of coals of the Northwest at the Station at Seattle under the direction of F. K. Ovitz. This work will include the use of powdered coal and the storage of coal. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director

Fuels, Gas Tar and Coke B8-19 Lignite. Work is being conducted at the Station of the Bureau of Mines at Fairbanks, Alaska, by John A. Davis on the preparation of lignite for market, and the use of this under boilers. A survey is being made of the power requirements for the interior of Alaska. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Metallurgy and Metallography B14-19 Graphite for Crucible Use. The Bureau of Mines is studying the preparation of graphite for crucible use at the station at Salt Lake City under the direction of F. G. Moses. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Metallurgy and Metallography B15-19 Flotation. The Bureau of Mines is investigating flotation at the Station at Salt Lake City under O. C. Ralston and at the Station at Seattle under W. H. Coghill. At both of these stations flotation oils are being investigated. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Paints, Varnishes and Resins B1-19 Luminous Paint. The Bureau of Mines through R. B. Moore, S. H. Schlundt, S. C. Lind, J. E. Underwood and C. W. Davis is investigating the cause of luminosity in radium luminous paints, and the reasons for changes in luminosity after the radium and zinc sulphide are mixed together. Bureau of Mines, Washington, D. C. Address Van H. Manning, Director.

Wood Products B3-19 Deterioration of Paper in Storage. The Bureau of Standards is testing a large number of samples of paper. Samples were tested in 1909. The results of these tests are to be compared with the tests of today. The rosin content seems to have increased 20 per cent and the strength has decreased 27 per cent. These results may be due to the change in method of making the tests. Bureau of Standards, Washington, D. C. Address S. W. Stratton, Director.

C—Research Problems

The purpose of this section of Engineering Research is to bring together persons who desire coöperation in research work or to bring together those who have problems and no equipment with those who are equipped to carry on research. It is hoped that those desiring coöperation or aid will state problems for publication in this section.

Apparatus and Instruments C14-19 Contraction of Sylphons with Aging. The sylphon is a corrugated tube of thin metal used as a combined spring and air container in various hydrostatically operated mechanisms. It is made at present by the Fulton Company, of Knoxville, Tenn. At present the sylphons vary in their free length with aging while retaining the same elasticity. As a result they operate at a different pressure from that intended. They usually decrease in length. It is desired, if possible, to obtain an equivalent mechanical device not subject to this defect. The requirements are as follows:

The device to be entirely of metal

The device to resist corrosion and damp air especially at sea

To be easy to assemble

To be capable of test for precision of operation without change of quality

To permit a maximum contraction of 25 per cent in length without permanent set.

Bureau of Ordnance, U. S. Navy, Washington, D. C. Address Chief of Bureau, Rear-Admiral Ralph Earle.

Apparatus and Instruments C15-19 Clamp for Wire Rope. Certain Ordnance equipment requires that pure copper wire rope be clamped without the use of any other metal than copper to a fitting by which it can be shackled or hooked to other parts. This joint is subject to continual bending of small amount, due to water motion, and joints so far constructed show failures just outside the clamp employed, due to the fact that the clamping and the stress produced by bending is not well distributed. It is required to have a clamp to meet the following specifications:

To contain no other metal than copper.

To permit clamping wire rope between ¼ in. and ½ in. nominal diameter

To be easy of assembly

To resist in the best manner continual bending in any plane to an amount not exceeding 15 deg.

To have an ultimate tensile strength of not less than 50 per cent of the rope used.

Bureau of Ordnance, U. S. Navy, Washington, D. C. Address Chief of Bureau, Rear-Admiral Ralph Earle.

D—Research Equipment

The purpose of this section of Engineering Research is to give in concise form notes regarding the equipment of laboratories for mutual information and for the purpose of informing the profession of the equipment in various laboratories so that persons desiring special investigations may know where such work may be done.

University of Maine D1-19 Equipment of Mechanical Engineering Laboratory:;

Five 150-hp. h.r.t. boilers

One 10 x 30-in. Hamilton-Corliss engine with Alden dynamometer

One Ford automobile engine

One six-cylinder Pierce-Arrow automobile engine

One 8 x 10-in. Fairbanks-Morse gasoline engine

One 2-cycle Knox marine engine, two cylinders 4½ x 4½, kerosene carburetor

One 4 by 6-in. Dean double-acting triplex pump

One 6-in. weir with 2-in. venturi meter and weighing tanks

One 170-sq. ft. Worthington condenser

One 7-kw. G. E. turbo-generator

One Junker calorimeter

One Olsen oil-testing machine

One 60,000-lb. Riehlé testing machine

One 150,000-lb. Riehlé testing machine

One 14,400-inch-pound Swiss torsion machine

One 2000-lb. beam testing machine

One 5-in. No. 3 Sturtevant blower.

F—Bibliographies

The purpose of this section of Engineering Research is to inform the profession and especially the members of the A.S.M.E. of bibliographies which have been prepared. These bibliographies have been prepared at the request of members, and where the bibliography is not extensive, this is done at the expense of the Society. For bibliographies of a general nature the Society is prepared to make extensive bibliographies at the expense of the Society on the approval of the Research Committee. After these bibliographies are prepared they are loaned to the person requesting them for a period of one month. Additional copies are prepared which are available for periods of two weeks to members of the A.S.M.E. or to others recommended by members of the A.S.M.E. These bibliographies are on file in the offices of the Society and are to be loaned on request. The bibliographies are prepared by the staff of the Library of the United Engineering Society, which is probably the largest engineering library in this country.

Fuels, Gas, Tar and Coke F6-19 By-Product Coking. A very complete bibliography on by-product coking theory and practice with discussion of by-products. A pamphlet of 40 pages. Price 5 cents. Address Director, Pittsburgh Carnegie Library, Pittsburgh, Pa.

Economics F4-19 Market Prices. A list of journals giving market prices listed under various industries. A six-page pamphlet published by the Pittsburgh Carnegie Library, Address Director, Pittsburgh Carnegie Library, Pittsburgh, Pa.

Mechanics, General F1-19 The Gyroscope. A bibliography of theory and application of the gyroscope to aeroplanes, monorail cars, marine navigation for stabilizing and compass. A bibliography of 23 pages published by the Pittsburgh Carnegie Library. Address Director, Pittsburgh Carnegie Library, Pittsburgh, Pa.

Paints, Varnishes and Resins F1-19 Lampblack. A bibliography of 8 pages giving books, magazine articles and patents relative to lampblack. Published by the Carnegie Library of Pittsburgh. Address Director, Carnegie Library of Pittsburgh, Pittsburgh, Pa

---

A unique educational project has been developed at Spartanburg, S. C., in connection with The Textile Industrial Institute of that place. Eighteen months ago it was decided to build a modern mill for instruction purposes if funds could be raised sufficient to carry through the undertaking. Generous subscriptions were secured of cash, materials and machinery, work was begun, and the main building is now nearly completed, of reinforced concrete, most modern in design and equipment. In fact it is said that in its appointments this will actually be the finest mill in the world.

Students will operate the mill. The superintendent, overseers, as well as all the operatives, will attend The Textile Institute and will manufacture a line of high-grade cotton cloth to be known as "Character Cloth" and sold direct to consumers by parcel post.

Every student in the mill will be given special training in the class room so that he will understand the theory of the process upon which he is engaged. It is also expected that he will be self-supporting by working every other week in the mill, for which he will receive pay sufficient to cover his expenses for two weeks. At first there will be two separate student organizations having a superintendent, corps of overseers, section hands, loom fixers and operatives. Later, as the work becomes organized, it may be possible to employ more than two shifts of students and thus run the plant at the highest possible teaching efficiency.

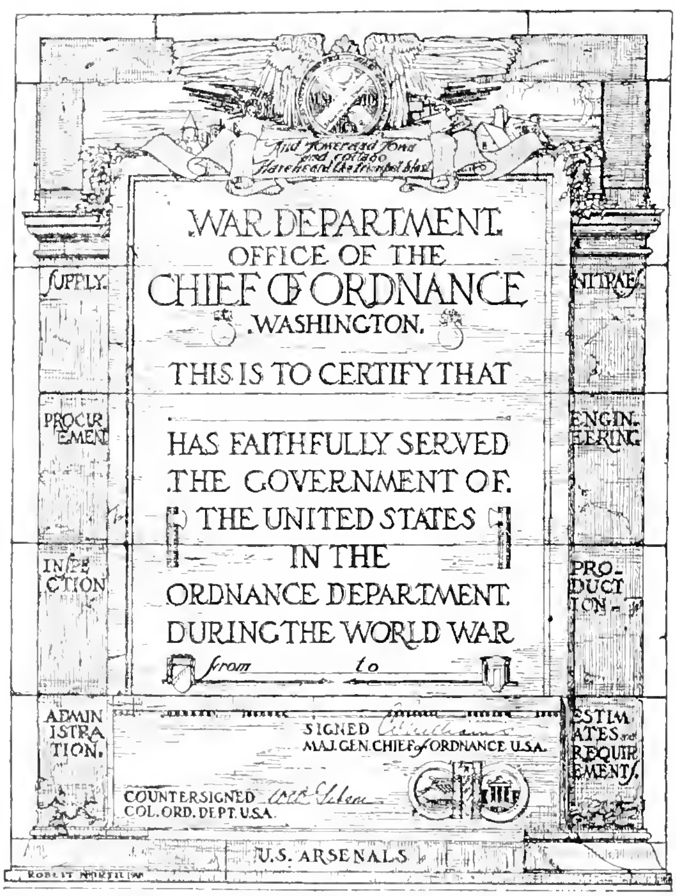
CORRESPONDENCE

Contributions to the Correspondence Departments of Mechanical Engineering by members of The American Society of Mechanical Engineers are solicited by the Publication Committee. Contributions particularly welcomed are suggestions on Society Affairs, discussions of papers published in this journal, or brief articles of current interest to mechanical engineers.

Certificates for Engineers in War Service in the United States

To the Editor:

In the September 1919 issue of Mechanical Engineering, attention was called by Mr. Donald A. Hampson to the fact that one of the most highly-prized possessions of the returned soldier is his discharge paper. For many years the soldier who was at the front will exhibit this paper with pride and long after his friends have forgotten his record of war service his discharge will stand as evidence of the deeds which he performed. Mr. Hampson also suggested that as "it was the rounding up of the country's resources of engineering that was largely responsible for the



Certificate Issued by Ordnance Department, U. S. A., in Recognition of Home Service

'year earlier than expected' result," the Government provide "some tangible mark or document" in recognition of the service rendered during the war by those engineers engaged in work here in the United States.

Such a document is obtainable upon request, at least from the Ordnance Department, and possibly from the other branches as well. The writer served about five months at Frankford Arsenal Gage Department and was then sent to the Engineering Division at Washington for work on the standardization of gages, serving one year and eight months in all. He received a certificate on which was indicated the two departments mentioned. There may be other engineers desirous of this memento; if so, they should address their former personnel officer.

There was also a pin purchasable after three months' service, a bronze bar after six months, a red bar after a year, a red and a bronze bar after eighteen months, etc.

H. S. Kartsher.

Cleveland, Ohio.

[The Ordnance Department has issued a Procedure for Distribution of Certificates of Faithful Service which states, in part, that " a certificate of faithful service may be issued to each employee of the Ordnance Department during the war, on request, when separated from the Ordnance Department without prejudice on or after November 11, 1918," and that "any employee entitled to a certificate may, on request, have a certificate mailed to him or her bearing the dates showing the period of service in the Ordnance Department during the World War."—Editor.]

The Usual Misleading and the Correct Statement of Averages

To the Editor:

Ask anyone for a definition of an "average" and how to arrive at such average. Ninety out of a hundred will answer in accord with the Century Dictionary:

"Average: A sum or quantity intermediate to a number of different sums or quantities, obtained by adding them together and dividing the result by the number of quantities added; an arithmetical mean. Thus, if four persons lose respectively \$10, \$20, \$30 and \$40, the *average* loss of the four is \$25."

And this definition is correct so far as it goes, but it does not go far enough and therefore is frequently distinctly misleading. Yet the great majority of people and engineers who deal with averages are content with this incomplete definition and fail to realize how absolutely misleading it may be and frequently is. A few simple examples will make this clear:

I. What is the average of $2 + 3 + 4$?

The usual answer is $\dfrac{2+3+4}{3} = \dfrac{9}{3} = 3.$

II. And similarly the average of $1 + 3 + 5 = 3$.
III. And the average of $3 + 3 + 3 = 3$.
IV. Again the average of $2 + 2 + 5 = 3$.

Here are four different series all having the same apparent average of 3.

The error lies in the disregard of the amount by which the average differs from the original values. The true average should include that and for the four examples is:

I. 3 Plus or minus 1
II. 3 plus or minus 2
III. 3 plus or minus 0
IV. 3 plus 2 or minus 1

When the average is so expressed it is at once clear that in I. the terminal values of the series are 2 and 4, in II. are 1 and 5, in III. are 3 and 3, and in IV. are 2 and 5.

Certainly it is not a matter of indifference, but may be a matter of decided importance to know whether maximum and minimum values of a series differ much or little from one another.

The importance will be clear from the following illustration taken from the writer's experience in the domain of mechanical engineering.

Occasion arose casting doubt on the uniformity of the strength of balls of a well-known and highly-regarded make. On voicing that doubt to the manufacturer the writer was assured that carefully conducted tests on a considerable quantity of balls showed marked uniformity within a relatively few points.

A request for the log of these tests disclosed the explanation and showed that the claim was made in perfectly good faith, but was nevertheless made in error; the averages took into account only the first number or ordinary average, whereas the second or + and — number of the correct average had not been considered.

The log follows: Breaking loads of three series of balls of equal diameter are —

	a	*b*	*c*
	62,500	76,000	93,500
	68,000	84,500	63,000
	72,000	86,000	74,000
	94,000	91,000	69,000
	83,000	75,500	71,500
	379,500	413,000	371,000
Average	75,900	82,600	74,200

This log, when the usual averages only were considered, showed a not very serious difference.

But had the correct method of stating the averages been used, then these would have been shown as

$$a\ 75{,}900\ {}^{-\,13{,}400}_{+\,18{,}100} \qquad b\ 82{,}600\ {}^{-\,7{,}400}_{+\,8{,}400} \qquad c\ 74{,}200\ {}^{-\,11{,}200}_{+\,19{,}300}$$

These three complete averages are fully representative of the entire series of tests, while the incomplete or ordinary averages give no clue whatsoever as to the seriousness of divergencies from the average.

a The ordinary average or 75,900 gave no clue as to whether this was an average of 75,901 and 75,899 with a difference of only 1 point + or —, whereas the actual difference between the numbers of the series was much more important, amounting to 13,400 — and 18,100+.

It is thus clear that these full or complete averages do convey full information. Had these complete averages been used their use would, in all probability, have avoided the unintentional giving of misleading information.

This misleading use of the term average is so general that it invades even such standard works as our engineering pocketbooks.

Thus Suplee gives the compression in pounds per square inch of granite as averaging 15,000 lb. and for four different varieties gives 12,000, 15,000, 16,000 and 15,000 lb. The average of these four varieties is $14{,}500\ {}^{-\,2{,}500}_{+\,1{,}500}$.

Assuming that all granites lie between the limits of the four cited, the complete average stated gives safe data.

Suplee further gives the average for slate as 10,000 lb., but quotes no varieties; yet it is certain that some slates are stronger and some weaker than others. What is their safe value? The completion of the average by the second term of $\frac{-}{+}$ would give the necessary information.

Similarly it is certain that some steel castings have higher elastic limits than the 40,000 lb. per sq. in. that Suplee quotes as average; but how much less or how much more is left to the reader's imagination. A complete statement of the average would here again substitute definite information for guesswork.

These few examples taken at random prove the need of a more complete definition, which, following the Century, would be:

"Average is that quantity intermediate a number of different quantities obtained by adding together these quantities, dividing the result by the number of quantities that were added, supplemented by a statement of the quantities by which the result differs from the largest and the smallest of the quantities. Thus, if four persons lose respectively \$10, \$20, \$30 and \$60, the average loss is $\$30\ {}^{-\,\$20}_{+\,\$30}$."

Henry Hess.

Philadelphia, Pa.

Present-Day Problems Discussed by E. W. Rice, Jr.

In an address at the opening meeting in Schenectady of the recently organized Eastern New York Section of the A.S.M.E., Mr. E. W. Rice, Jr., president of the General Electric Company, urged engineers to give more attention to economic problems and emphasized the importance of increased production and simple living as a means of offsetting the difficulties of today. He said in part:

Engineers have been so busy increasing the productivity of man that they have not noticed that many people, who have profited thereby, have been equally busy in an effort to decrease the productiveness. Engineers are workers, not talkers, and have been inclined to ignore the talkers who were not workers.

This attitude was fairly safe as long as the talkers had no influence on the result. The situation has changed greatly during the last few years. Millions of producers were taken out of production to form armies and navies and to take care of their supply and maintenance. Besides the loss of the production of useful goods, there was, of course, added the tremendous destruction and wastes of war. In view of such a situation, what action should be taken by the engineer?

With his training and record, he would, of course, bend every energy to replace the destroyed goods and increase the output of the world's farms, factories and mines; he would improve the methods of transportation, not only to meet the current demands, but to make up for the losses of the last five years. This country and the whole world needs to produce greater quantities of every useful thing more than ever before in its history. Most people who think clearly and without passion and prejudice agree with the engineers on this subject, but there are others, unfortunately, who act as if they did not see the world's need, or seeing it, did not care. They demand shorter hours, although this means loss of production, and they strike, thus actually stopping production altogether for a time to enforce their demands for lessened production.

What would you think of an engineer who deliberately designed machinery to produce fewer articles rather than more, who instead of trying to increase his usefulness and service to the world, made every effort to reduce the value of his contribution? I imagine that we would pity him and the verdict would be that he had lost his mind. Now it is difficult to believe that these masses of men, of which I speak, are all crazy or wicked, and therefore the problem to be solved is to find out what is the matter with them.

I suggest as possibly the most reasonable answer that they are ignorant of the fundamental economic facts and principles. They really do not know what they are doing. The essential principles of economics are not difficult to ascertain or to understand. I think we all wish to get at the truth. The problems of today are created by a lack of understanding and appreciation of the great principles of economics which are built upon the experience of men during the long evolution upward from savagery and barbarism.

I am anxious to see engineers devote more time to the study of economic facts and principles. I feel sure that if they approach this investigation in the same spirit and use the same methods that they employ in solving mechanical problems, they will arrive at a satisfactory solution.

The high cost of living is one of our basic present-day problems. The ultimate solution from the standpoint of an engineer would seem to be increased production so that the world may have an abundance of the things which are needed or desired. Until this increased production has been obtained and a bountiful supply of goods realized, it would seem to be our duty to restrict our desires and demands as much as possible and to make the same sacrifices which were so cheerfully made during the war. It has been suggested that the present high cost of living is aggravated and increased by the extravagance of the great majority of people — rich and poor.

The engineer will readily appreciate that if such extravagance is limited to a few, the effect on the high cost of living will be negligible, while if indulged in by many, it will be most serious.

ENGINEERING SURVEY

SUBJECTS OF THIS MONTH'S ABSTRACTS

AIR MACHINERY

Blowers for Aero Engines, W. G. Noack. Description of blowers built in Germany for use in supercharging aircraft engines at high altitudes.

The blowers are of the centrifugal type. Three or four stages are directly driven off the engine shaft, suitable provision being made to prevent torsional oscillation. The delivery is regulated by throttling the air intake of the blower. The carburetor has to be compensated for variations of air pressure in the usual manner. The speed of rotation is very high—10,000 to 11,000 r.p.m., and special steels are used for the rotors. The weight of a blower complete with fittings suitable for an engine 260 hp. and capable of reproducing ground-level conditions up to 15,000 ft. is 125 lb. The power consumed is about 25 hp. *(Flugsport,* Sept. 19, 1919, abstracted through *The Technical Review,* vol. 5, no. 48, Oct. 28, 1919, p. 82, *d)*

ENGINEERING MATERIALS (See Metallurgy and Ignition Apparatus)

HEAT TREATING

Copper Diffusion through Cast Iron, H. E. Diller. When a malleable-iron bar packed in copper oxide packing and annealed at 1000 deg. cent. was taken from the furnace it was found that the copper oxide was reduced to metallic copper, which latter was melted and penetrated into the iron. An average sample of

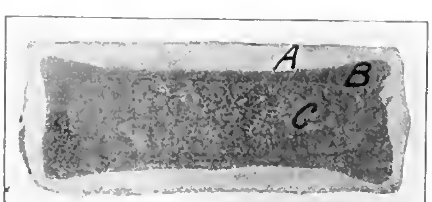

Fig. 1 Cross Section of Gray-Iron Bar Annealed in Copper Oxide Packing

the bar showed that the carbon had been reduced from 2.70 to 0.60 per cent and that there was 21.4 per cent copper.

The test showed for this bar a strength of 68,200 lb. per sq. in. and an elongation of 1 per cent in 2 in. The electrical conductivity of the metal was not materially increased by the presence of the copper.

In other tests the test pieces were packed in black copper oxide and heated to about 900 deg. cent. The results were different and a far smaller penetration of copper was observed.

With gray iron quite different results from those for malleable iron were obtained. This is illustrated in Fig. 1, which shows a cross-section of one of the bars. Three distinct areas can be seen. The area *A* contains all of the copper. There is a thin layer of copper on the outside and next to this the copper is very finely divided and is in the form of droplike areas surrounded by a

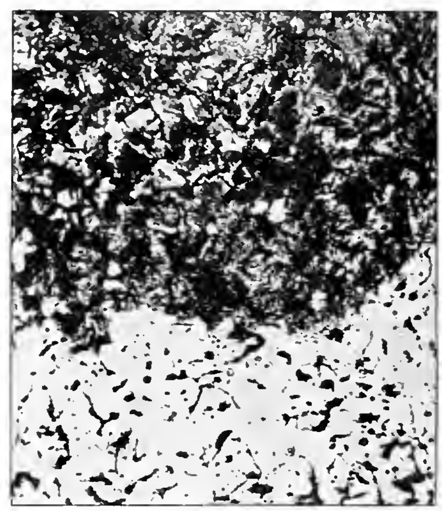

Fig. 2 Dividing Line Between *A* and *B*, Fig. 1

Fig. 3 Structure of *B* and *C*, Fig. 1

matrix of iron. This matrix has a peculiar structure and is more like steel than it is like gray iron. The line between *A* and *B*, Fig. 1, is shown in Fig. 2. The dark area is the portion containing the copper. The light portion in the same figure represents

the structure of the section marked *B* in Fig. 1. The same structure is seen in the upper section of Fig. 3, which is part of the dividing line between areas *B* and *C*. This structure is almost like the structure of malleable iron in its appearance under the microscope, but scattered through it can occasionally be seen flakes of graphite.

The center of the bar *C*, Fig. 1, has the structure of unchanged gray iron. This is shown in the lower section of Fig. 3. (*The Foundry*, vol. 47, no. 334, November 1, 1919, pp. 779-780, 6 figs., *e*)

HYDRAULIC ENGINEERING

Orifice Measurement of Water-Pipe Discharge

THE ORIFICE AS A MEANS OF MEASURING FLOW OF WATER THROUGH A PIPE, Raymond E. Davis and Harvey H. Jordan. The thin-plate orifice may be used with confidence for measuring the discharge of water through pipes. Like nearly all methods, it is subject to some limitations, although it helps to fill a growing need which has been partly filled by the pitometer and by the injection of chemicals. The pipe orifice is in effect a portable venturi meter, the disadvantage of the pipe orifice being the relatively large lost head caused by the obstruction of the orifice plate; however since the pipe orifice method is probably best adapted to temporary use the lost head may in general be unimportant. In a long pipe line also the lost head caused by the orifice would be relatively small. Cases in which the pipe orifice should be of particular value have already been suggested in the introduction.

Although all the deductions and conclusions given in this summary apply to the measurement of water, attention should be called to the fact that the pipe orifice is adapted to measuring the discharge of air, gas, and steam through pipes.

The following points are important as a guide to the proper use of the pipe orifice method of measuring the discharge of water through a pipe:

1 The two sections of the pipe between which change in pressure head may be most reliably determined are the section at which normal flow is discontinued and the stream begins to converge as it approaches the orifice, and the section of greatest contraction of the jet after it leaves the orifice. Regardless of the size of pipe, for all sizes of orifice which it is feasible to use, the distance from the plane of the orifice to the section of beginning of convergence may be taken as eight-tenths the pipe diameter, and the distance of the section of greatest contraction as four-tenths the pipe diameter.

2 The drop in pressure head between these two sections is greater than that to be found for any other two sections near the orifice.

3 Having given the measured difference between the pressure head at the section of beginning of convergence and the pressure head at the section of greatest contraction the discharge may be determined through the use of one of two equations given in the original paper. (In one of these equations there is used a coefficient of discharge which is a variable quantity.) It decreases as the size of pipe increases; it decreases slightly as the drop in pressure head increases; it has a minimum value for orifices having a diameter of one-third that of the pipe and increases as the diameter of the orifice becomes greater or becomes less than one-third the diameter of the pipe.

4 The lost head caused by any given orifice in the pipe in terms of the velocity in the pipe may be determined by an equation given in the original paper, and is always less than the drop in pressure head between the section of beginning of convergence and the section of greatest contraction, but approaches it in value as the ratio of the diameter of the pipe to the diameter of the orifice (D/d) increases.

5 Due to the fluctuations of the liquid in the gage tubes the systematic error of reading the gage increases as the ratio of the diameter of the pipe to that of the orifice decreases, but when that ratio (D/d) is 2 or greater the error may under normal conditions of flow be reduced to a negligible quantity by a proper manipulation of apparatus. As (D/d) becomes less than 2 the accidental error of reading the gage increases very rapidly, and also small errors in the measurement of the diameter of the pipe or the diameter of the orifice are likely to be the constant sources of an error of increasing magnitude in the computed discharge. The indications are that, for favorable conditions of flow and with care in installing the apparatus and in observing, discharge may be determined generally within 2 per cent when the diameter of the orifice is not in excess of two-thirds that of the pipe, but this size of orifice seems to be about the maximum that can be used except for approximate determinations of discharge. When the magnitude of the lost head is not the controlling factor in the choice of size of orifice, best results are likely to be obtained if the diameter of the orifice is not greater than one-half that of the pipe.

6 For orifices having a diameter greater than one-half that of the pipe the use of two opposite pressure openings at each section is important because of the probability of the orifice being somewhat eccentric with the pipe, unless greater care is taken in placing the orifice than will usually be found practicable. Systematic errors of observing may be greatly reduced by proper throttling.

7 The coefficient of discharge for bevel-edged orifices is a much more variable quantity and is materially greater than the coefficiency of discharge for thin square-edged orifices. The use of the bevel-edged orifice seems not to be practicable, except for approximate measurements when the orifice diameter is greater than two-thirds of the pipe diameter. HYDRAULIC MACHINERY

DETERMINATION OF ENERGY LOSSES IN CENTRIFUGAL MACHINERY ON THE BASIS OF THEIR CHARACTERISTIC CURVES, R. Muller, Dr. of Engrg. Data of an investigation having reference to centrifugal machinery in which a liquid or gaseous material of substantially constant density flows through one or more centrifugal wheels

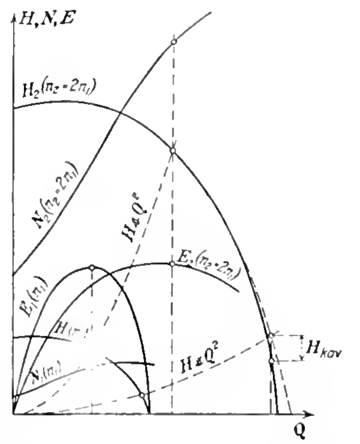

FIG. 4 CHARACTERISTIC CURVES OF A CENTRIFUGAL PUMP WITH CONSTANT SPEED OF ROTATION IN REVOLUTIONS n_1 AND $n_2 = 2n_1$

having full admission. The problem under consideration is to determine the energy losses occurring in the machinery, to separate them into their main components and to express their functional relation to known magnitudes by means of constant or variable coefficients. It is assumed that there are available constructional and blade drawings of the machine, data of tests and characteristic curves.

These characteristic curves are given for a centrifugal pump in Fig. 4 and show the output demand *N*, delivery head *H*, and efficiency *E* as a function of the amount of water *Q* delivered in one second at constant speed in revolutions *n* (or 2 *n*) of the pump wheel.

The article itself is of a mathematical character not suitable for abstracting under the present conditions of publication of the Journal. The whole calculation is based on the assumption that the known deviations of the actual flow through the turbine wheel as compared with what they should be in accordance with the Euler theory may be credited to secondary phenomena of flow within the wheel itself. As far as possible at the present time proper loss coefficients are used in the computation of the various components of the total loss, these loss coefficients being derived partly from the estimation of the characteristic curves and partly by direct experimentation. As regards these latter, references are given to technical literature where data as to their value may be found. (Beurteilung des Energieverlustes von Kreiselradmaschinen auf Grund ihrer Kennlinien, R. Mueller, *Zeitschrift des Vereines deutscher Ingenieure*, vol. 63, no. 26, June 28, 1919, pp. 601-607, 12 figs., *t*)

IGNITION APPARATUS

Nickel Spark-Plug Terminals Deteriorate through Excessive Local Heating

Deterioration of Nickel Spark-Plug Terminals in Service, Henry S. Rawdon and A. I. Krynitzky. The most commonly used material for terminals in spark plugs is commercial nickel wire containing about 97 per cent nickel, the remainder being manganese, cobalt, iron, copper and minor impurities. The peculiar type of deterioration that occurs in these nickel terminals during the service life of the spark plug was recently brought to the attention of the Bureau of Standards, the present paper giving the main results of the investigation.

It has been found that the deterioration of the central terminal was quite negligible compared to that of the side terminal or terminals. These latter wires had developed, in service, transverse cracks that in many cases were as sharp and definite as a knife cut. After a separation occurred the bridge widened by loss of material from ends of the fractured wires until a gap of as much as one centimeter often resulted. The fragments of the deteriorated wire terminals removed from the spark plugs were found on the whole to be rather ductile and stand several sharp right-angle bends before breaking. The extreme end portion immediately adjacent to the break, however, was brittle and broke readily when an attempt was made to bend it.

The examination of the central terminal showed that a change of the same character as occurred in side terminals had taken place in this one also, but to a far less extent.

The tests would indicate that variations in chemical composition such as occur in commercial nickel wire are not a determining factor in the deterioration of the wire in service. Terminals of nickel of relatively high purity were found to be attacked in the same manner as others of lower nickel content. Oxidation of the nickel does not appear as being of great importance in this connection, and the action of hot reducing gases, though somewhat greater than that of oxidizing, does not appear to be very great either.

It would appear that the main cause of embrittlement of the wire lies in the intense local heating by means of the electric spark, together with the sudden cooling, and that once the formation of transverse intercrystalline cracks has started the application of a relatively low stress to the hot wire is sufficient to fracture the wire. (*Bulletin of the American Institute of Mining and Metallurgical Engineers*, no. 152, August 1919, pp. 1323-1350, 21 figs., *e*)

INTERNAL-COMBUSTION ENGINEERING

British Improvements in Diesel Engines

British Stationary Diesel Engines of Today. Brief notes on various improvements introduced by British manufacturers in the last five or six years.

Mirrlees, Bickerton & Day have introduced in their engines a pilot jet of kerosene to form a flame for the ignition of a varying jet of tar oil, which enables this difficult form of fuel to be used successfully at all loads.

The same firm has recently introduced the air-blast controlling device shown in Fig. 5, the purpose of which is to control the pressure of the air blast to suit the varying loads in central-station work.

It has been recognized that the proper proportioning of the air to the load and hence to the amount of fuel used results in a smoother-running engine due to better combustion of the fuel owing to a reduction of the cooling effect of the incoming air.

In the device shown in Fig. 5 two pointers are fitted centrifugally on a dial calibrated in pounds per square inch of blast-air pressure ranging from the pressure suitable for no load up to that for full load, one pointer being operated by the blast-air pressure and the other by the main generator current passing through the solenoid *A*. The calibration of the gage is so adjusted that the latter finger points to the pressure which is suitable for the power being given by the engine instead of to the amperes being given by the generator, as would be the case if the gage were being used an as ammeter, which, in fact, it is. The two pointers are insulated from each other, but are provided with platinum contacts coupled to wires through which the circuit can be made through the relay *H*. Thus, if the generator pointer is separated from the

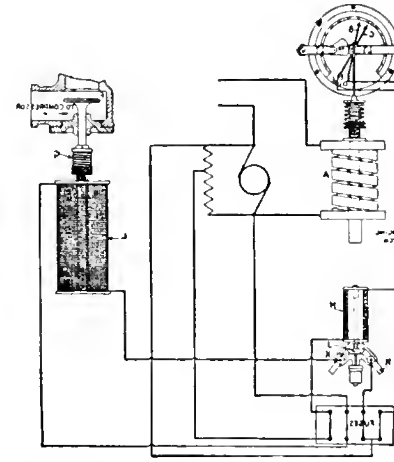

Fig. 5 Mirrlees Air-Blast Controlling Device

air-pressure pointer no current passes through the relay *H* and the core *J* falls and closes the circuit through the carbons *K* and so through the solenoid *L*, which opens the throttle valve *F* to the air compressor and increases the supply of air till the two pointers coincide. In actual practice when on a steady load the apparatus is constantly working and it has been found that the improved combustion so procured actually increases the life of the exhaust valve.

Hick, Hargreaves & Co. state that their valve rockers are now made of cast iron, not the ordinary cast iron of commerce, but something more of a malleable nature, and they give no trouble.

The same firm evolved the cylinder cover shown in Fig 6. Their belief was that one could not expect to get a rigid casting of unequal thickness to withstand the unequal temperature stresses to which this part is subjected. The utmost possible flexibility has therefore been aimed at and only the inlet- and exhaust-valve pocket walls are carried right through. This leaves a large space between the two pockets for water circulation. This space is not completely filled in by the fuel-valve pocket as is usual, and instead of a thick cast-iron ring a light steel tube is used. This tube is screwed into the bottom and a watertight joint is secured at the bottom by a series of sharp concentric serrations on the face of the lower shoulder, the top being riveted over. The air-starting valve pocket is formed in the same way. Then in order to obtain the full benefit of the passages so formed, internal combustion pipes are fitted (shown dotted in the drawing) which direct the water round the exhaust and fuel valve and make for thorough cooling of those parts.

In the engines of Willans & Robinson, Ltd., the fuel-pump suction valve is used as the medium for stopping the engine in the event of the failure of the water circulation.

From the article it would appear that a good deal of attention is paid by British Diesel engine manufacturers to the neat design of their air compressors. *(The Engineer,* vol. 128, no. 3328, Oct. 10, 1919, pp. 349-351, 6 figs., *d)*

Practical Brake-Horsepower Formula for Internal-Combustion Engines

A Practical Brake-Horsepower Formula for Internal-Combustion Engines, Herman Lemp. The author's formula has been derived from the old formula, $PLAN/33{,}000$, and is peculiarly convenient in that all its numerical coefficients have been combined into a single round number, 1,000,000. This formula is:

For a single-acting multi-cylinder engine of the four-stroke cycle type:

$$\frac{s \times d^2 \times n \times N \times MP}{1{,}000{,}000} = BHP \ldots\ldots [1]$$

To suit these conditions the special formula described above has been derived from the well-known horsepower formula: $PLan/33{,}000 = IHP$, which gives the indicated horsepower of a single-cylinder double-acting engine, in which P stands for the mean effective pressure in lb. per sq. in. of piston area (usually termed MEP), L for the length of piston stroke expressed in feet, a for the area of piston expressed in square inches, n for the number of strokes (2 × revolutions) per minute, and 33,000 for the ft-lb. per min. contained in one horsepower.

To adapt this formula to the brake horsepower of a multi-cylinder engine of the four-stroke cycle, single-acting type, the formula becomes:

$$\frac{PLan \times N \times M}{33{,}000 \times 2} = BHP$$

where M stands for mechanical efficiency, N stands for the number of pistons, and n for number of revolutions.

Since in a four-stroke cycle an active stroke occurs only every other revolution, the formula is divided by 2, or further expanded becomes:

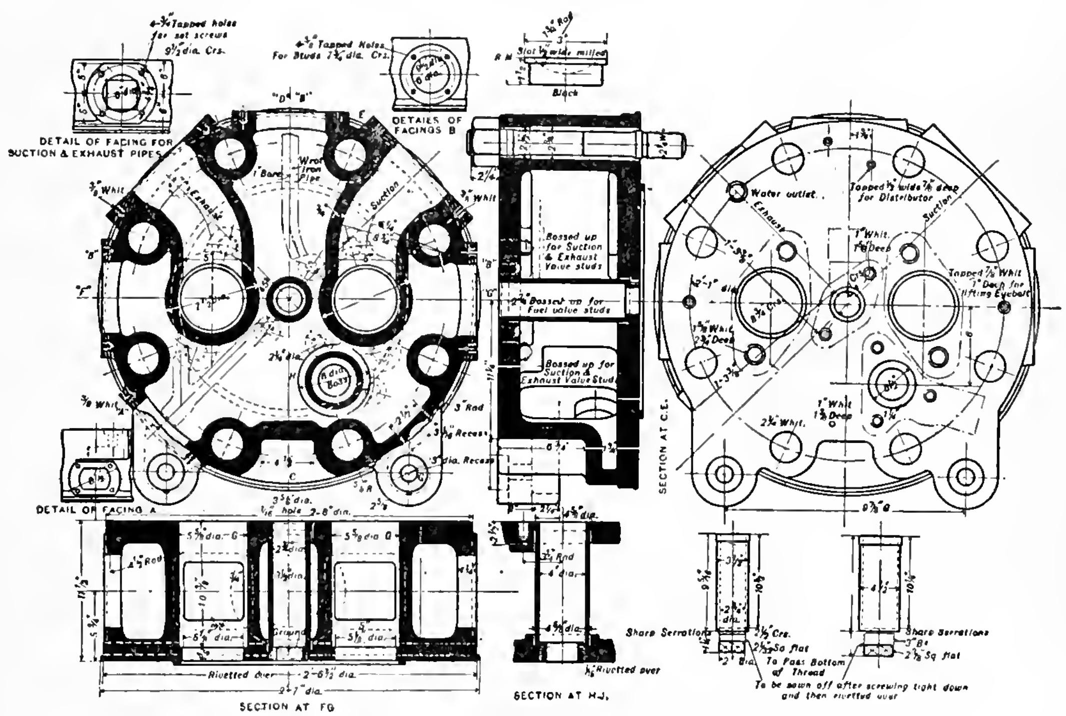

Fig. 6 Hick, Hargreaves & Co. Diesel-Engine Cylinder Cover

For a single-acting multi-cylinder engine of the two-stroke cycle type:

$$\frac{s \times d^2 \times 2 \times n \times N \times MP}{1{,}000{,}000} = BHP \ldots. [2]$$

in which s stands for stroke of piston in inches, d for diameter of piston in inches, n for number of revolutions per minute, N for number of pistons (not cylinders), MP for mean effective pressure (MEP) in lb. per sq. in. of piston area multiplied by mechanical efficiency.

For a double-acting engine [1] and [2] should be multiplied by 2.

The preponderant number of internal-combustion engines are single-acting, of multiple-cylinder type, and work on the four-stroke cycle. They are mostly used in automobiles, motor boats, airplanes, and stationary lighting sets, and are usually of a speed so high that the taking of indicator diagrams is not practical, while on the other hand the brake-horsepower outputs are easily ascertained by a cradle dynamometer, a Prony brake, or a plain electric generator whose efficiency curve is known. Furthermore, the stroke of such an engine is usually expressed in inches.

$$\frac{P \times \frac{s}{12} \times d^2 \frac{3.14}{4} \times n \times N \times M}{33{,}000 \times 2} = BHP$$

The formula may now be simplified by writing all constant factors together, followed by variables; thus we have:

$$\frac{3.14}{4 \times 12 \times 33{,}000 \times 2} \times s \times d^2 \times n \times N \times MP = BHP$$

The first part of the formula may now be solved and replaced by $\frac{1}{1{,}008{,}403}$, or for all practical purposes $\frac{1}{1{,}000{,}000}$, and we then have the final formula [1] shown at the head of this article, namely,

$$\frac{s \times d^2 \times n \times N \times MP}{1{,}000{,}000} = BHP \ldots\ldots\ldots\ldots [1]$$

The fact that the quotient of the constant factors $\frac{1}{1{,}008{,}403}$ when

replaced by $\frac{1}{1{,}000{,}000}$ produces an error of less than nine-tenths of one per cent had been discovered accidentally by the writer at the time this formula was developed, and it is this feature which renders the formula particularly useful.

We may now write the formula in the following form:

$$\frac{s \times d^2 \times n \times N}{1{,}000{,}000} = \frac{BHP}{MP}$$

showing that the relation between *BHP* and *MP* remains for any set of conditions.

The slide rule is extremely useful for solving either *BHP* or *MP*, by multiplying $s \times d^2 \times n \times N$ and setting 1 on scale *C* over the product, when by means of the rider either *MP* may be read off on scale *C* or *BHP* on scale *D*. This is best illustrated by a complete example:

A four-cylinder, four-stroke cycle engine of 5-in. bore, 6-in. stroke delivers at 600 r.p.m., 22.9 b.hp. What is its *MP?*

$$6 \times 5 \times 5 \times 600 \times 4 \times MP = 22.9\ BHP$$

Multiplying $6 \times 5 \times 5 \times 600 \times 4$ on the slide rule brings the rider to 36 on scale *D*, opposite which having placed 1 on scale *C*, one will find opposite 22.9 on scale *D* an *MP* of 63.6 on scale *C* (see Fig. 7).

This *MP* (accurately 64) is based on 80 *MEP*, with a mechanical efficiency of 80 per cent, which with a compression of 60 lb. is reasonable to expect in a normally designed engine.

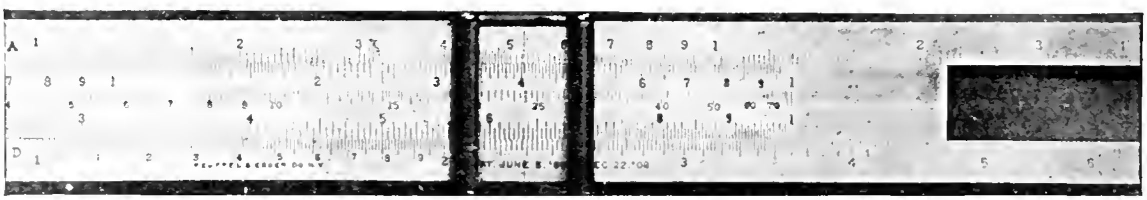

Fig. 7 Illustrating the Application to the Formula of a Concrete Case by Use of the Slide Rule

With slide rule set as above, the respective values of *MP* and *BHP* can be varied at will, since their relation remains constant.

The writer wishes to lay particular stress on the value of *MP* as a characteristic value whereby to compare engines. We find this value in recent works and technical papers expressed as *mean effective pressure per b.hp.* or *brake mean effective pressure.*

The writer has already recommended that *mean pressure* or its symbol *MP* should be adopted for this value and this figure is being used more frequently. A high *MP* is an indication that both the indicated horsepower for a given displacement is high and the internal friction is low, hence a large b.hp. is developed.

To illustrate: Diesel engines have a very high mean effective pressure owing to a high thermal efficiency, but the mechanical efficiency is relatively low as compared with automobile engines of the constant-volume type. For this reason the *MP* is only slightly larger than that of an engine of the constant-volume type. An *MP* of from 70 to 84 is the average.

On the other hand, we have quite a number of aviation engines of the constant volume type which have an *MP* as high as 100 and 105. This is due to the high thermal efficiency with a high mechanical efficiency. *(General Electric Review,* vol. 22, no. 10, October 1919, pp. 808-809, *pA)*

Changes in Engine Design Due to Poorer Grades of Fuel, P. J. Dasey. The author, who is research engineer for the Buda Company, claims that fuel changes are imposing serious handicaps on the production and use of the present types of combustion engines.

In one Detroit factory where records are kept of each carload of gasoline received, it was found that early in 1916 there was delivered in tank-car lots gasoline of which 92 per cent distilled over 300 deg. fahr. In 1917 one sample tested showed an end point of 327 deg. fahr., another 350 deg. fahr. and all the rest 400 deg. fahr. In 1918 the first sample tested showed an end point of 420 deg. fahr. In 1919 the end point gradually rose from 425 to 465 deg. fahr., and it seems to be understood that the present grade of fuel can last but a few months before it will have to stand another addition of kerosene in order that sufficient volume of fuel be produced to take care of the present automotive equipment.

It means that within a comparatively short time practically the only available fuel will be composed of what used to be gasoline and kerosene mixed. In other words, the distillation process will be carried on without a stop until all the light and heavy naphthas are wrought into one fuel and that fuel will have an end point of about 500 deg. fahr. or higher.

The use of the heavier fuel, however, is apt to cause crankcase dilution, a condition which is more serious in engines using lighter grades of lubricating oil (such as are commonly used in splash-feed engines) than in those of the pressure-feed types in which heavier oils can be used. (*Power Wagon*, no. 180, November 1919, p. 25. *p*)

MACHINE PARTS AND DESIGN

The Equation of the Involute, N. Finkelstein. The mathematics of an involute curve are of interest because they apply to the design of the involute form of gear tooth. The writer evolves simplified formula for finding the thickness of the tooth at any point from the base circle to the point of the tooth. The article is of a mathematical character not suitable for abstracting, notwithstanding its interest. *(American Machinist,* vol. 51, no. 15, October 9, 1919, pp. 693-694, 2 figs., *m)*

The Manufacture and Design of Tooth Gearing. A general paper of which the most interesting part is that referring to tooth pressures for lubricated gearing.

The following method of determining tooth pressure for spur and double helical reduction gearing is used by an Italian firm, Luigi Pomini, Castellanza, Milan. It has been found to give good results with spur gearing, and is being applied tentatively to double helical gearing:

P = load in lb. per in. of width of tooth
p = circular pitch in inches
v = velocity of pitch line in ft. per sec.
R = factor depending on the number of teeth in the pinion and the reduction ratio

$$P = Rp \times \frac{1480}{v + 32.8}$$

For cast-iron spur gears the value of *P* is taken as above; for steel spur gears 3 *P* is taken as load; for cast-iron double helical, 1.5*P* is taken and for steel double helical, 4.5*P*. Values of *R* are given in the following table and apply to enclosed lubricated gearing.

No. of Teeth in Pinion	Reduction Ratio							
	1 : 1	1 : 2	1 : 3	1 : 4	1 : 5	1 : 6	1 : 8	1 : 10
12	2.8	3.4	3.8	4.2	4.36	4 54	4.8	5.0
14	3.2	3 8	4.2	4.6	4.88	5.08	5.4	5.6
16	3.5	4.2	4.64	5.06	5.36	5.58	5.84	6.1
18	3.8	4 4	5.0	5.4	5 76	5 96	6 24	6 44
20	4.2	4.9	5.4	5.9	6.2	6.4	6.88	6.9
24	5.0	5.76	6.3	6.8	7.04	7 3	7.6	7.8
28	5.7	6.4	7.04	7.6	7.88	8.14	8.5	8.64
32	6.4	7.28	7.92	8 4	8.8	9.04	9.4	
36	7.2	8.1	8.76	9 24	9 6	9.88		
40	7.9	8.84	9.56	10.28	10.44			

These factors have been deduced from observations on the wear of lubricated teeth with circular pitches varying from ½ in. to 2½ in. They are valuable in determining tooth pressures for high-speed gearing where wear of the teeth is the determining factor.

In the discussion which followed, Bernard H. Brown called attention to the alleged lack of uniformity in the proportions of stub teeth adopted by different makers. He found that teeth cut to the dimensions given in the following table (40 deg. included angle) gave satisfaction in every way.

Pitch, diametral	Cutter pitch	Thickness of tooth on pitch line in.	Dedendum. in.	Addendum. in.	Whole depth. in.	Amount added to pitch diam. to obtain outside diam., in.
2 to 2½	2	0.7854	0 463	0.4000	0.863	0.8000
2½ to 3	2½	0.6283	0.3857	0.3333	0.719	0.6666
3 to 4	3	0.5236	0.289	0.2500	0.539	0.5000
3½ to 4½	3½	0.4488	0.257	0.2222	0.479	0.4444
4 to 5	4	0.3927	0.231	0.2000	0.441	0.4000

(*Transactions of the North-East Coast Institution of Engineers and Shipbuilders,* vol. 35, pt. 3, May 1919, pp. 134 and 136, *gp*)

Wedge Bolt. Description of a device intended to take the place of the standard bolt. As shown in Fig. 8, it consists, first, of

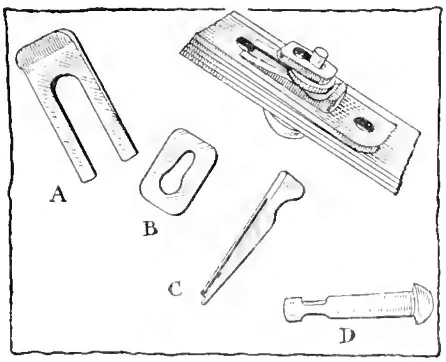

Fig. 8 Wedge Bolt

a wedge slotted through its length to accommodate the thickness of the bolt; next, of a washer with a hole resembling an ordinary keyhole; and, third, of the bolt or pin which is a plain unthreaded bolt with two shoulders or rather slots punched on opposite sides near its point.

The procedure on the job is as follows. While one workman passes the pin or bolt through the hole, another slips the keyhole washer over the pin. It is engaged in the slot, bears on the shoulder and then the wedge is placed between the washer and the bolt; the workman gives it a few raps with his hand hammer and is ready for the next.

The plates are then reamed if necessary, and the riveter follows to perform his particular task. As each wedge bolt is passed the riveter taps the wedge with his hammer and as the contrivance is released the holder-on at the other side of the plate takes out the pin and sticks another (hot one) through in its place. It is stated that at a plant in Portland a hull is being constructed with these wedge bolts without the use of a single threaded nut. (*Pacific Marine Review,* vol. 16, no. 11, November 1919, pp. 118, 1 fig., *d*)

MACHINE SHOP (See Machine Parts and Design)

MARINE ENGINEERING

Turbine-Gear Drive for Torpedo-Boat Destroyers, W. B Flanders. The design of propelling machinery for destroyers is an unusually difficult problem in view of the fact that a 1200-ton destroyer requires propelling machinery of a capacity equal to that put into a 30,000-ton battleship and that this machinery must be operated by a force of 30 to 40 men in the small boat as against 200 in the large boat.

The relatively greater power required by the destroyer is due to its higher speed. The power required increasing approximately as the fourth power of the speed and the two-thirds power of the displacement. As the propeller speed can be increased with the ship speed, the speed of the propelling machinery can also be

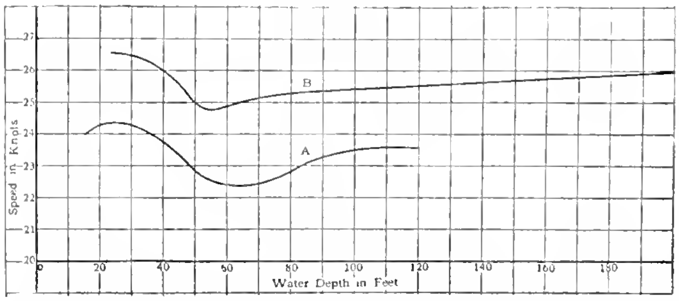

Fig. 9 Speed Curves of Destroyers in Various Depths of Water and with Constant Indicated Horsepower

increased, in addition to which the type of machinery must be of the simplest form possible consistent with reliability and economy.

Increased rotative speed means decreased size and weight of driving machinery. The use of reduction gears allows the main turbines to have higher speeds, which, in its turn, leads to decreased steam consumption with the resultant decrease in weight of fuel necessary for a given cruising radius. Furthermore, with the high-speed geared turbines a relatively large number of rows of blades or stages can be used at slower speeds, at which the boat chiefly operates, which tends to give good efficiency at these speeds.

The article gives brief information on the fuel economy of boats of the *Clemson* type compared with similar data of the U. S battleship *Tennessee.* It is of interest to note in this connection that in unofficial builders' trials on the *Clemson* at about 30 knots the machinery developed a shaft horsepower on slightly less than one pound of oil per hour, and that the boats reached a full speed ahead of 35 knots.

Interesting data are presented in reference to the influence of the depth of water in which a boat is moving on its speed. In general, the deeper the water up to at least one boat length, the faster the boat will go with the given propulsive power, but with long narrow boats of the torpedo or destroyer type there may be a shallow depth at which the boat speed will actually be higher than at any greater or lesser depth. This is shown in Fig. 9 made from trial data and has been confirmed in trials of the destroyers of the *Clemson* type. (*The Electric Journal,* vol. 16, no. 11, November 1919, pp. 474-476, 6 figs., *de*)

METALLURGY

Occlusion of Gases by Metals

The Occlusion of Gases by Metals. At the meeting of the Faraday Society, London, November 12, 1918, a general discussion took place on the occlusion of gases by metals.

The president, Sir Robert Hadfield, gave a brief historical account of the development of our knowledge of this subject and then proceeded to discuss the nature of occlusion of gases.

As showing the remarkable influence of gas upon such a metal as nickel, the following experiments were carried out by the speaker. Nickel wire was obtained of very high purity and malleable, the latter quality being shown by the fact that it was drawn into excellent wire free from all defects. This wire was heated three times in an oxidizing Bunsen flame reaching a temperature of about 1000 to 1100 deg. cent.; another specimen was also heated, but in a reducing flame of about 900 to 1000 deg. cent. Both specimens remained unchanged, but on heating the third time in an oxidizing flame over a dish of burning sulphur the wire became quite brittle and similar results occurred when heating to about 1000 deg. cent. over an open coke fire, this showing the penetrability of gases into this metal.

It was only after difficulties due to the presence of occluded gases had been overcome that it became possible to produce intricate steel castings; for example, hydraulic cylinders for cotton baling presses, the design of which is discussed in some detail by the writer.

Sir Robert Hadfield also touched in some detail on the subject of slag inclusion and critical forging temperatures, and appended to his address a bibliography on occluded gases covering 73 items.

Prof. Alfred W. Porter of University College, London, opened his discussion with some general remarks on occlusion of gases in metals, discussing, among other things, the occlusion of hydrogen in palladium.

A paper by Cosmo Johns was devoted to the consideration of the physical properties of metals as affected by their occluded gases. In particular, he objects to the use of the term "occlusion" to cover all the complex changes that must occur when various gases are absorbed by or become constituents between gases that were originally absorbed as such, and those formed as reaction products during cooling. The first might be called primary and the last-mentioned secondary.

There is evidence that under certain conditions iron above the critical range can absorb nitrogen and that the properties of iron and steel are seriously affected when such absorption takes place.

On the whole, the writer believes that under the term "occlusion of gases in metals" there have been included such widely differing phenomena as solution, the formation of definite compounds which may dissociate when the conditions are changed, and gaseous products formed as the result of reactions between non-gaseous substances in solution in the liquid metal which had undergone changes in concentration, and thus were no longer in equilibrium, during the consolidation of the metallic mass.

The gaseous constituents of the metals used for constructional purposes affect their properties more profoundly than is generally admitted

As all the metals used for industrial purposes contain gases as constituents, and as all the more complete physical investigations of the common metals have been made on specimens containing such gases, it follows that we have no knowledge of the properties which the pure metals or alloys would possess, if they could be produced, and such data as are available can only refer to metals or their alloys with an unknown quantity of gases as important constituents.

Capt. J. W. McBain discussed the theories of occlusion and the sorption of iodine by carbon. As regards the latter, in particular, it is claimed that adsorption may be accompanied by absorption, so that, in addition to rapid condensation on the surface, there may be a slow diffusion which goes on for long periods of time. This was shown in experiments on the sorption of iodine by carbon, extending over periods of many years. The writer gives the following summary of his views:

It is once more emphasized that sorption phenomena should not receive clear-cut designations as adsorption and absorption (solid solution), etc., until the experiments have adequately shown that the particular case is a pure type of only one of these factors, which are known in a number of cases to occur simultaneously.

Attention is drawn to Langmuir's hypothetical explanations of all these chemical phenomena, in which he has crystallized out views shared by a number of authors.

The long-continued diffusion following on rapid surface condensation involves in the case of animal carbon more than half of the total iodine sorbed.

Thomas Baker, in a paper on the gases occluded in steel, describes an investigation carried out with the view to determining the effect of occluded gases on the physical properties of steel and also to discovering the relation, if any exists, between the temperature of evolution of the gas and the critical points of the steel.

The results of all the experiments are collected in the following table.

Description	Weight of Steel in grms.	Volume of Gas per grm. of Steel in c. c.	Volume of Gas in c. c.	Average percentage composition				
				CO_2	H_2	CO	CH_4	N_2
Sound steel....	69.3	1.32	91.86	1.68	52.00	45.53	0.72	0.07
Sound steel reheated........	47.3	1.40	66.54	1.16	49.55	45.99	2.71	0.59
Steel with blowholes	63.2	0.66	42.10	0.88	54.56	42.36	1.73	0.47
Soft ingot.......	66.6	1.03	68.84	1.18	52.12	45.64	0.73	0.33
Bar from soft ingot...........	67.7	0.53	36.25	0.91	49.08	48.12	0.11	1.77

Thermal critical points of these steels occur at the following temperatures:

	A_{C1}	A_{C2}	A_{C3}	A_{r1}	A_{r2}	A_{r3}
Sound steel and steel with blowholes......	746 deg.	746 deg.	746 deg.	693 deg.	693 deg.	693 deg.
Soft steel ingot and bar	722 deg.	758 deg.	867 deg.	682 deg.	760 deg.	846 deg.

POWER PLANTS

Influence of Air Leakage on Design and Operation of Surface Condensers

Calculation of Dimensions and Conditions of Operation of Surface Condensers with Air Leakage, K. Hoefer, Dr. of Engrg. An extensive, largely mathematical discussion of the influence of air leakage on the design and operation of surface condensers. An attempt is made to establish formulæ which will permit determining numerically the behavior of a condenser under various operative conditions, in particular the influence of air leakage on the available vacuum.

The presence of air in a condenser has as a consequence the fact that the temperature of steam is not all the time equal to the saturation temperature t_c of the steam corresponding to the condenser pressure p_c, but there occurs a fall of temperature with the fall of partial pressure due to falling off in the weight of steam through condensation.

The author states that there are ten factors affecting the degree of vacuum available, namely, (1) cooling air of the condenser, (2) amount of steam handled, (3) amount of cooling water, (4) temperature of cooling water, (5) weight of air leakage, (6) efficiency of air pump, (7) coefficient of heat transmission from steam to

cooling water, (8) coefficient of heat transmission from water of condensation to cooling water, (9) coefficient of heat transmission from air to cooling water and (10) design of condenser. The writer discusses all these points in succession, though not in the order given, and starts with point 10, which is "design of condenser."

In this connection he points out that while the construction of the condenser, the type employed, etc., materially affect the vacuum, these are factors which cannot be expressed numerically. Because of this, a certain amount of estimating based on the experience or judgment of the designer has to be used in applying the formulæ expressing the influence of the other factors to each individual condenser installation.

Coefficient of Heat Transmission from Steam to Cooling Water and from Water of Condensation to Cooling Water. He points out, in this connection, that these coefficients are materially affected by the velocity of flow of cooling water and, in addition to it, such other factors as diameter, length, material, wall thickness and character of surface of the condenser tubes; likewise, by the amount of turbulence in the flow of the water.

Of all these factors the author considers only the influence of the velocity of flow of cooling water when it is desirable to determine the amount of vacuum obtainable from a given condenser of given dimensions at different rates of flow of cooling water. In this case the velocity of flow of cooling water and hence the coefficient of heat transmission varies as the amount of cooling water flowing per unit of time, and the upper curve in Fig. 10 may be used as expressing average conditions. The lower curve on the same figure gives the coefficient of heat transmission from water of condensation to cooling water.

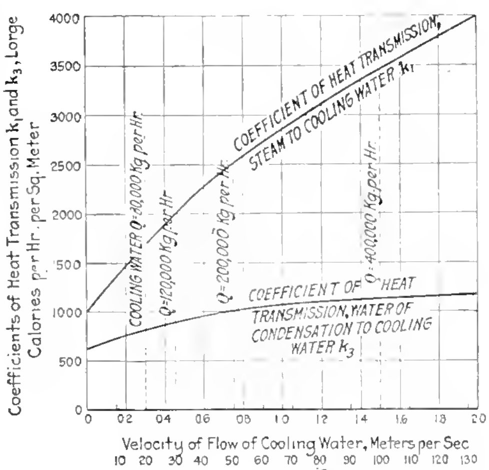

Fig. 10 Coefficients of Heat Transmission

It may be stated in this connection that the coefficient of heat transmission from steam to cooling water depends also on the steam pressure, as has been shown in a previous investigation of the author. The influence of steam pressure is however only slight and the coefficient of heat transmission has been shown in the tests carried out by the writer to rise only about 5 per cent when the steam pressure in the condenser increases from 0.1 to 0.2 atmos. abs.

Coefficient of Heat Transmission from Air to Cooling Water. In this connection, the writer uses an equation previously derived by Nusselt.

Further, the writer states that of the factors affecting the vacuum obtainable in a condenser, particular attention must be paid to air leakage. Since it is believed to be impossible to derive general formulæ which would cover this case, a numerical example is taken as the basis of consideration. It is assumed that we have a surface condenser 100 sq.m. (1076.4 sq. ft.) cooling area operating with cooling water having an inlet temperature of 15 deg. cent. (59 deg. fahr.) The condenser works in connection with the steam turbine operating on steam of 12 atmos. abs. pressure and 300 deg. cent. (572 deg. fahr.) superheat, or a heat content of 728.3 large calories per kg. (2882.9 B.t.u. per lb.) At full load of 800 hp. the turbine consumes 4000 kg. of steam (8818 lb.) per hour, if the consumption of the cooling water is 200,000 kg. (440,924 lb.) per hour or 50 times that of the steam and if there is no air leakage in the condenser. As will be shown later, to do this the condenser pressure must be 0.046 atmos. abs., which, together with the amount of steam used, the initial state of the steam and output, gives the effective efficiency of the turbine as 58 per cent. It is further assumed that the output of the turbine does not vary with varying vacuum in the condenser, but if, under these conditions, the condenser pressure rises above 0.046 atmos. abs. the steam consumption becomes greater than 4000 kg. per hour or vice versa. This assumption is more in correspondence with actual conditions than that of constant steam consumption. For the purpose of computing the steam consumption it is further assumed that the efficiency of the turbine does not vary, which is not exactly a fact, however. Fig. 11 gives the theoretical (adiabatic) heat difference, the usefully employed heat, and the steam con-

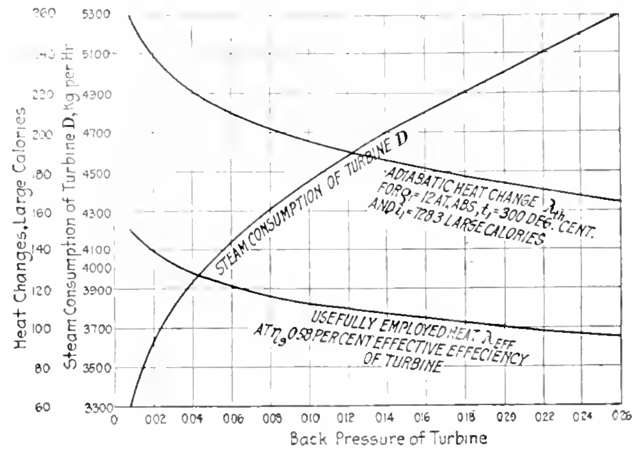

Fig. 11 Fall of Heat and Steam Consumption in a 800-Hp. Steam Turbine with Variable Condenser Pressure

sumption *D* of the turbine for various condenser pressures, the fall of pressure between the turbine and condenser being neglected.

Next are discussed the influence of dimensions and kind of air pumps used, influence of the cooling water and of the cooling area available, all of these being illustrated by curves. (Berechnung und Betriebsverhältnisse der Oberflächen-Kondensatoren unter Berücksichtigung der in den Kondensator eindringenden Luft, K. Hoefer. *Zeitschrift des Vereines deutscher Ingenieure*, vol. 63, nos. 27-28, July 5-12, 1919, pp. 629-635 and 650-653, 14 figs., *t*)

RAILROAD ENGINEERING

Gasoline Engines for Street-Railway Cars

Gasoline vs. Electric Motors, N. W. Storer, Mem.Am.Soc. M.E. Discussion of the respective merits of the two types of propulsion for street-railway service. The writer claims that while the gasoline motor is excellent for certain classes of service such as automobile and truck work, it is not suitable for street-railway cars.

The electric motor is almost ideally suited for street-railway service. Its speed-torque characteristics meet the requirements as the electric motor has the enormous starting torque of the overload capacity and flexible speed characteristics necessary to give the rapid acceleration and different speeds for street-railway service. In point of reliability it also stands very high and its cost of maintenance, depreciation and power are all relatively low.

The gasoline motor can make street cars run but its speed-torque characteristics are not well adapted for the work. Thus, it absorbs from 25 to 30 per cent of its normal amount of power when running idle. It has no starting torque and very little torque at low

speeds. Gear ratios help to balance this weakness, but at best the gasoline motor would give a very poor acceleration for a street car unless it were very much overmotored.

The reliability of the gasoline motor is also claimed to be less than that of the electric motor.

As regards costs, it is claimed that they would be higher for gasoline cars because the cost of maintaining the transmission on motor trucks and motor buses is very high. It is also claimed that the life of a gasoline motor is shorter than that of an electric motor.

It may be well to call attention, in this connection, to the fact that whenever the author speaks of motors for street-railway service he compares the electric motor with the aeroplane-type gasoline motor, which is, of course, the very last thing that could be thought of for applying in street-railway service. *(Aera, vol. 8, no. 3, October 1919, pp. 375-378, g)*

STEAM ENGINEERING (See also Power Plants)

TIN FUSIBLE BOILER PLUGS: MANUFACTURE AND TESTING, L. J. Gurevich and J. S. Hromatko. Data of an examination, at the Bureau of Standards, of tin fusible boiler plugs for the Steamboat Inspection Service and of the tests made subsequently.

The experimental results show that there are six primary causes for the rejection of fusible plugs which may be roughly divided into two classes. Under the first class, rejections are included due to mechanical defects of casing material. The second class includes rejections due to lack of purity of the tin filling. The impurities in the latter case may be those either present in the original tin or those introduced during the manufacture of the plug.

The following conclusions have been reached as to the precautions to be taken in the manufacture of fusible plugs:

1 The pig tin should be at least 99.7 per cent pure, containing not more than 0.1 per cent lead, or 0.1 per cent zinc, which are the requirements of the Steamboat Inspection Service.

2 The casing should be of bronze, an alloy the major constituents of which are copper and tin. Small amounts of zinc and lead increase the ease of casting and machining and are not objectionable if not present in greater amounts than in the following compositions:

	I	II
Copper	88	87
Tin	10	7
Zinc	2	5
Lead	..	1

3 The pot or crucible for melting the tin should not be used for melting other metals, thus doing away with the liability of contaminating the good tin when these are not thoroughly cleansed.

4 Casings should be tinned on the inside with the same grade of tin used for filling, but the tin left over from this process should not be added to the filling to be used. Zinc-chloride flux may be used although hydrochloric acid is preferred, though no flux need be used during the filling process.

5 The casing should be preheated to not above 250 to 275 deg. cent. (482 to 527 deg. fahr.) and tin should be poured at a temperature not above 275 to 300 deg. cent. (527 to 572 deg. fahr.). *(Bulletin of the American Institute of Mining and Metallurgical Engineers, no. 152, August 1919, pp. 1351-1360, epA)*

FLOW OF STEAM THROUGH PIPES, Bassett Jones. Formulæ for the flow of steam through pipes simplified in such a manner as to lend themselves to accurate computation.

The ultimate formula given is

$$W = 60\ Ac\ \sqrt{(pD\ L)} = m\ \sqrt{(pD\ L)}$$

where A is the area of the pipe in square feet, c a constant, p pressure drop in pounds per square inch, D mean density of steam in pounds per cubic foot, L equivalent length of straight pipe. The value of $m = 60\ Ac$ may be computed once for all for each pipe size.

Values of $\sqrt{(pD)}$ for various values of pD can be computed for various initial pressures and in the original article a table is given for same, so that the only computation not of plain first order multiplication necessary in any application of the above formula is the finding of the value of $\sqrt{L}$. In computing L the usual allowances must be made for fittings, valves, openings, etc.

The author gives several examples of the application of this formula. *(General Electric Review, vol. 22, no. 10, October 1919, pp. 805-807, 1 fig., p)*

STANDARDIZATION

STANDARDIZATION OF SPINDLE NOSES FOR MILLING MACHINES IN GREAT BRITAIN. Because of the large number of American milling machines in Great Britain the proposed standard noses are designed to apply for the time being, only to machines of British manufacture, although the adoption of a common standard for British and American manufactures is recognized as being highly desirable.

The design of spindle noses has changed considerably in recent years as a result of the heavier duty which has been performed by milling machines. Screwed spindle noses have been found to be faulty for heavy work and the tendency has been to adopt on new designs either parallel or taper fits, holding the cutter back by a draw bolt through the spindle, the torsion being taken by the clutch drive.

It is generally agreed that some form of clutch drive is necessary on a spindle nose for heavy milling and it has also been found necessary to harden the clutch to prevent distortion.

The illustration in Fig. 12 shows four suggested standard noses.

The article does not state to what extent standardization of spindle noses has proceeded in Great Britain. *(The Engineer. vol. 128, no. 3328, Oct. 10, 1919, p. 358, 1 fig., dg)*

THERMODYNAMICS

THEORY OF EQUILIBRIUM CONDITIONS IN SATURATED STEAM: UNDERCOOLED STEAM. In a series of articles by H. M. Martin (see MECHANICAL ENGINEERING, February 1919, p. 150) it was claimed that when wet steam is expanded through a turbine it never attains a condition of thermal equilibrium until the condenser is reached.

In the criticisms to which the above hypothesis has so far been subjected there appears to be a disposition to accept the view that supersaturation does persist down to the Wilson line, but there has seemed to be more hesitation in admitting that thermal equilibrium is not reëstablished at the Wilson line and maintained throughout the remainder of the expansion. There is, however, some direct evidence in favor of the view that the condition of supersaturation persists.

In the first place, Wilson found that when the expansion was prolonged beyond the Wilson line the number of droplets formed was enormously increased, showing that those already in existence ceased to act as effective centers for condensation once they had attained a certain size, and any further condensation had to take place on other nuclei, which is possibly only when the steam is undercooled by some tens of degrees.

Again, the exhaust temperature of a turbine as measured by a thermometer appears in normal working conditions to be invariably a little below that corresponding to the pressure. In this connection Allen's condenser experiments are mentioned to show that the discrepancy is due not to erroneous readings from the thermometer, but conditions surrounding the operation of the thermometer prevented from giving reliable indications.

Coming back to the question of droplet formation, it is stated that any change of state involves either an increase of pressure or the performance of external work that change takes place with difficulty. A "catalyst" is commonly necessary to make the change possible. In the case of supersaturated steam not merely has work to be done in forming the surface films of the droplets, but the ultimate effect of the change from the undercooled condition is an increase in the volume occupied. The presence of a "catalyst" is

thus doubly necessary, and this is for the most part provided by the Wilson nuclei which are molecules having a constitution H_4O_2, or perhaps H_6O_3, or even possibly H_8O_4. The existence of these combined molecules in steam is proved by a comparison of the theoretical and actual volumes occupied by unit weight of the steam.

From this it appears that there are a certain number of aggregated molecules in steam, the number of which depends on the temperature and pressure of the steam and is quite unaffected by turbulence. It is on these aggregated molecules that condensation occurs when the expansion is carried far enough.

As has been stated above, the presence of a catalyzer of some kind is necessary for condensation to occur. The condensation of thermal equilibrium is more stable than that of supersaturation, but to pass from the one state to the other involves the performance of work. The energy liberated on condensation is not instantaneously available to this end, as time is necessary for its conversion into the form of heat. The presence of a catalyzer makes it possible for the transformation to take place in two stages. In the first stage condensation occurs without development of heat and with the consequent contraction in volume. In the second stage the energy liberated on condensation is converted into heat and absorbed by the vapor which, therefore, increases in volume of pressure. It is probable that the transformation is, for the most part, completed within a very small fraction of a second.

From this point of view it would appear that when condensation occurs at the Wilson line there must be at least a temporary diminution of volume and this decrease of volume is considerably greater than it would be if the weight of steam at first condensed were only that requisite to the ultimate attainment of thermal equilibrium. The condensation comes down in the first instance as droplets which are smaller than those known to show the Brownian movements. They may thus be considered as equivalent to molecules of a very dense gas and will not therefore add to the frictional resistance experienced by the steam as it passes through the turbine. When, however, such droplets coalesce to form large droplets, the conditions are changed, and it appears quite conceivable that such large droplets may give rise to increased losses in nozzle and blading.

It would appear also that condensation of steam at the Wilson line is likely to be excessive and expansion beyond the Wilson line will begin accordingly with the volume not intermediate between the equilibrium volume and the volume corresponding to no condensation, but may actually be considerably smaller than the latter. How long such an excessive condensation persists is not known, but if it may be untrue for any appreciable time, as is possible, expansion beyond the Wilson line will proceed with an unusual volume smaller and final volume greater than was provisionally presumed in the theory as was exposed by H. M. Martin. (Editorial article in *Engineering*, vol. 108, no. 2806, Oct. 10, 1919, pp. 483-484, *tA*)

New York Printers' Strike Ended

Continuing in our efforts to publish as regularly as possible the successive numbers of Mechanical Engineering regardless of the printing strike in New York, which completely tied up the printing plants of that city for a period of more than six weeks, this Journal is again issued from a plant outside of the city under difficulties which inevitably attend such an undertaking. It is expected that copies will reach the membership during the latter part of December.

In all probability the January number will again be published in New York City by our regular printers, who have the facilities for rapid production and will thus be able to gain time, which we hope will permit the distribution of the January number at a relatively earlier date. The striking printers have, for the most part, returned to their old positions, and it is believed that the stability of the industry is now assured, although still subject to conferences which are to be held for adjustments with regard to wages and other matters.

A Successful Annual Meeting

The fortieth Annual Meeting of The American Society of Mechanical Engineers, held in New York, December 2 to 5, was the largest meeting in the history of the Society, having a registration of upwards of 2100. In its professional sessions, its social features and in the many committee meetings was evidence of a fine spirit and enthusiasm, a close bond between members of this great organization and a loyalty to the high principles and ideals of the engineering profession.

Although the meeting nominally opened on Tuesday, December 2, there were various committee meetings on Monday. On Tuesday evening, the night of the presidential address, Honorary Membership was conferred upon Charles de Freminville, consulting engineer, Creusot Works, France, and announcement was made of Honorary Membership to be conferred upon Auguste C. E. Rateau, of the Rateau, Battu and Smoot Company, France. At the Business Meeting interest centered in the reports of the Aims and Organization Committee and of the Joint Conference Committee of the Founder Societies, discussion of which was continued in the afternoon of that day. No less than ten professional sessions were held, one of which, the keynote session, comprised a series of strikingly important addresses on Industrial Unrest, before an audience which filled the auditorium of the Engineering Societies Building.

On Thursday evening was the annual lecture and reunion, with two addresses, one by Col. E. A. Deeds, of Dayton, Ohio, on The Future of Aviation, and one by Col. Thurman H. Bane, on the Present Development of the Military Airplane. After the lectures the audience assembled upon the fifth floor of the Engineering Societies Building and on the first floor where there were reunions for a social time.

Although this number of Mechanical Engineering will not reach its readers until well past the date of the meeting, it will be impossible to incorporate a further account of the meeting in this number, owing to the publication difficulties involved as a result of the printers' strike which has already been alluded to. It is expected that this report will appear in the January number.

Salaries of Engineers in Canada

A report dealing with the classification of engineering organizations and proposed qualifications and remuneration for engineering services, prepared by the Toronto Branch of the Engineering Institute of Canada, is published in the November issue of the journal of that society. *The salary schedule proposed by the committee is based on the pre-war cost of living and does not take into account the very great increase which has occurred during recent years.* Classifications are made for engineers employed in railway work, municipal work, industrial work, large public utilities, and public works.

Of greatest interest to mechanical engineers are the recommendations of the committee for engineers employed in industrial work, a summary of which follows:

Chief Engineer. A chief engineer in charge of research, mechanical, electrical, chemical or metallurgical work, should be a graduate from an engineering school recognized by the Institute, with from 10 to 15 years' experience in his special line, and should receive a salary from $3600 to $10,000, according to the size of the industrial works where he is employed, and the extent of his responsibility.

Assistant Chief Engineer. An assistant chief engineer in a large industry should preferably be a technical graduate with from 5 to 10 years' experience. His salary should be 75 per cent of the salary of the chief engineer, with a minimum of $3000. This recommendation applies also to the engineer in general charge of all outside construction.

Designing Engineer. The designing engineer having responsible charge of all design in any one of the branches of mechanical, electrical, structural, or heating and ventilating engineering, should preferably be a technical graduate with 5 years' practical experience in his special line, or, should be a high school graduate with 10 years' practical experience, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering. His salary should be 50 per cent of the salary of the chief engineer, with a minimum of $2700.

Estimating Engineer. The engineer in charge of estimating, figuring costs, etc., should preferably be a technical graduate with 3 years' practical experience in his special line, or, should be a high school graduate with 8 years' practical experience, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering. His salary should be 35 per cent of the salary of the chief engineer, with a minimum of $2400.

Testing Engineer. Same qualification and salary as for estimating engineer.

Resident Engineer on Construction. Same qualification and salary as for estimating engineer.

Designer, Assistant to Designing Engineer. The assistant designer to a designing engineer should preferably be a technical graduate with 2 years' practical experience, or should be a high

school graduate with 4 years' practical experience, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering. His salary should be $2400.

Chief Draftsman, responsible for all working drawings. To be qualified by training and experience for the special work required of him. (Salary not stated.)

Assistant Estimator. The assistant estimator to an estimating engineer should preferably be a technical graduate with 2 years' practical experience, or should be a high school graduate with 3 years' practical experience and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering. His salary should be $2400.

Squad Boss. The squad boss, in charge of small squad of draftsmen, should be a high school graduate with 3 years' practical experience, including 1 year's experience as checker, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering. His salary should be $2100.

Chief Shop Inspector. The chief shop inspector, in charge of shop inspection, should preferably be a technical graduate with 1 year's experience, or should be a high school graduate with 3 years' experience as inspector, and should have a good general knowledge of mathematics and the fundamental physical laws used in engineering. His salary should be $2100.

Draftsman. A draftsman, making detailed working drawings, should preferably be a technical graduate or have 3 years' experience in drawing, tracing, etc. His salary should be $1800.

Engineers Honor Eugene Schneider of France

On Monday evening, November 24, the Four Founder Societies, upon the invitation of the Mining and Metallurgical Society of America, joined with that organization in a testimonial dinner at the Hotel Biltmore, held in honor of Charles Eugene Schneider, head of the famous Schneider-Creusot Steel Works of France. The dinner was the occasion for the presentation to Dr. Schneider of the gold medal of the Mining and Metallurgical Society of America, which is annually awarded for research work in metallurgy. Dr. Schneider is the first other than an American to be so honored.

H. H. Knox, the president of the Mining and Metallurgical Society of America, was toastmaster, and the speakers were Bradley Stoughton, secretary of the American Institute of Mining and Metallurgical Engineers; Dr. Henry M. Howe, professor emeritus of metallurgy at Columbia University; Charles M. Schwab; and Brigadier-General Manus McCloskey, U. S. A.

A closer understanding between this country and France was urged by Dr. Howe, as he declared that future conflict with Germany was "inevitable." "German treachery persists," he said, "and will persist to plague our descendants. German vices spring from the nature of the people and not from their form of government. The Germans are avowedly criminal. They avow criminal intent."

Dr. Howe also called attention to the magnitude of the Creusot works, where 250,000 men are employed, and he pointed out that this works had supplied three-fourths of the French artillery used in the war, and also had furnished Belgium and Serbia with guns. Engineers from Creusot, he said, had been sent to the United States when this nation declared war to help in organizing the American steel industry for war.

Mr. Schwab also paid high tribute to the French ironmaster, whom he has known for thirty years. Mr. Schwab declared that there is a greater problem ahead of the Allies than forging guns of war, and that is the forging of the guns of public opinion, and no man, he said, was better qualified to do this than Charles Eugene Schneider.

General McCloskey told of the use to which the guns manufactured by Mr. Schneider were put by the American troops at the front.

Earlier in the day Stevens Institute of Technology, at Hoboken, N. J., conferred the degree of Doctor of Engineering upon Mr. Schneider. Dr. Alexander Humphreys, president of Stevens, conferred the degree and Mr. Schneider responded by a brief address, in which he praised the work of American engineers in France and suggested that French and American universities exchange students as well as professors.

Pan-American Financial Congress

An indication that engineers are no longer confining themselves to their profession but are playing a larger part in public affairs is found in the confirmation of the appointments of C. B. Lord, Mem.Am.Soc.M.E., of the St. Louis Section of the Society, and Calvin W. Rice, Secretary of the A.S.M.E., to the Permanent Group Committee of the Pan-American Financial Congress. The Permanent Group Committees were established at the time of the first Pan-American Financial Conference, May 25-29, 1915, by Secretary McAdoo, with a view to assembling and studying material concerning the financial and commercial relations between the United States and the countries for which they were respectively appointed.

The second Pan-American Financial Conference will take place in Washington, January 12-17, 1920. Mr. Lord, serving on the committee of the Dominican Republic, and Mr. Rice, on that for Bolivia, will join with other appointees in conferring with the official delegations from the other American republics. The Committee will enter into executive session to study the problems submitted by the official delegations from the different countries and will submit for the consideration of the entire conference conclusions which will be based upon its examination of those problems.

American manufacturers of machinery and engineering and structural materials will be interested to learn of the Andhra Engineering Company of Cocanada, India, who are endeavoring to introduce American machinery and engineering materials into the Indian market and desire to get into communication with American machinery firms. The information came through a letter forwarded by Clinton H. Scovell, Mem. Am. Soc. M. E., of Scovell, Wellington and Company, of Boston.

International Electrotechnical Commission

The International Electrotechnical Commission which suspended its meetings during the war, recently held a conference in London, at which 18 countries were represented by 52 delegates. A Special Committee on the Rating of Electrical Machinery was appointed in order to push forward this work, which was regarded as of the highest importance to the electrical industry, more particularly to its export trade. Increasing attention is being given to the work of the International Electrotechnical Commission by the manufacturers of the world who are prepared to coöperate in the formulation of standards for the simplification of international commerce.

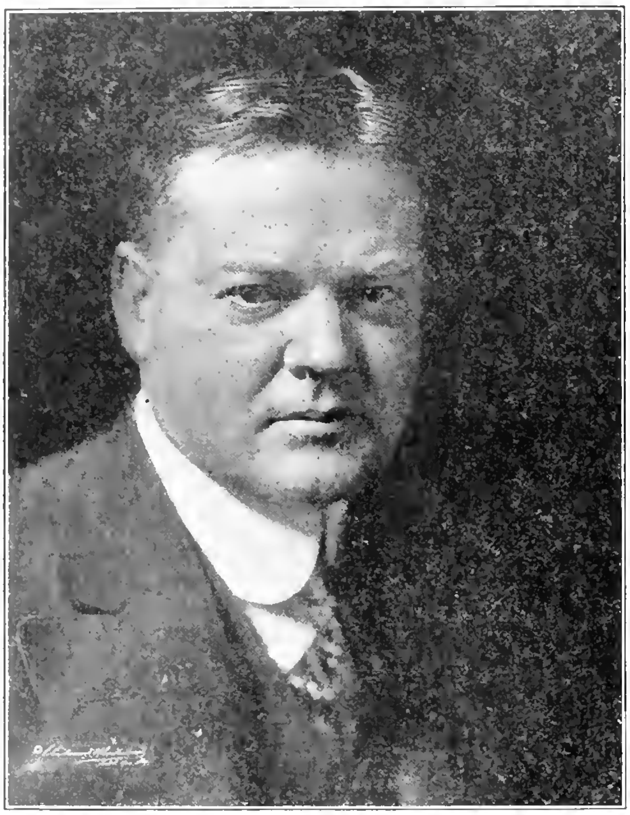
The Librarian of the Public Library of Sydney in New South Wales has written the Society of their desire to obtain regularly any trade catalogs published by members of the Society. The "Condensed Catalogs" and other trade catalogs already received from the United States have been very freely used and it is felt that other catalogs would also be of valuable aid in fostering trade relations between Australia and the United States.

The headquarters for Rhodes scholarships in the United States from now on will be at the Massachusetts Institute of Technology. Professor Frank Aydelotte of the Institute staff has been appointed Secretary to the Rhodes scholars throughout the United States. He will have leave of absence from the Institute for this academic year and will devote all his efforts toward the selection of men from American universities who are to be sent to Oxford College.

Herbert Hoover to Head Mining and Metallurgical Engineers

Herbert Hoover, the engineer who so ably typifies the modern definition of engineering as written on the wall of the Engineers' Library in New York, "Engineering, the art of organizing and directing men, and controlling forces and materials of nature for the benefit of the human race," is to be the next president of the American Institute of Mining and Metallurgical Engineers.

Mr. Hoover received his early training as a mining engineer at Stanford University, Cal. He first served with the United States Geological Survey, then went to West Australia and China, in mining activities. He took part in the defense of Tientsin during the Boxer disturbance in 1900. He was also engaged as consulting and managing engineer in metallurgical, mining and railway operations in Mexico, Russia, Africa and India. His work in London up to the beginning of the world war was notable in that he departed from the usual share-promotion schemes of the mining market, developing the properties in which he was interested purely on technical lines.



Herbert Hoover

When the war broke out in 1914, he gave up his management and directorships and began his service on various committees and commissions. The first of these was as chairman of the American Committee in London. He began his work the morning after England declared war on Germany, taking charge of the relief of American refugees.

In October 1914 he organized the Commission for the Relief of Belgium. Under his supervision millions of people were continually supplied with food, many of whom were entirely dependent upon this relief. Shortly after America entered the war, Mr. Hoover was summoned to Washington to take charge of the food situation here. The problem was a large one, as food demands from Europe were centered upon the United States. His organization of volunteer workers all over the country did much in making this work successful.

Mr. Hoover served as member of the War Trade Council since 1917, as director general of Allied Relief, director general of the American Relief Administration, chairman of American Economic Delegation at Paris, chairman of Food Section of Supreme Economic Council of Peace Conference, including supervision of transportation and communications of Eastern Europe, and later, as chairman of the Supreme Economic Council.

The work that Mr. Hoover has done in relief of the civilian population of Europe since the signing of the armistice has proved again his right to the title of "engineering economist." In this great task which he has performed so successfully, those characteristics coloring all his achievements have again been emphasized. His ability to get men to do things, to organize them and direct them in action, his knowledge of the right methods to follow and the psychological moment to act in order to secure the full measure of support and the greatest degree of success, may be largely attributed to his training as an engineer and make him worthy of the many honors accorded him and especially of this one, the presidency of the American Institute of Mining and Metallurgical Engineers.

SLOW-SPEED TESTS OF KINGSBURY THRUST BEARINGS

(Continued from page 917)

On Friday, October 31, the machine was run at 0.5 r.p.m. for $4\frac{1}{2}$ hours. The load was carried by the heavy spring throughout the run, but its compression gradually decreased. The machine was then run at various speeds, beginning with 3 r.p.m., to see if the bearing had been improved by its long run at 0.5 r.p.m. The bearing was to be maintained at each speed for 15 min. The friction force at low speeds was less than it had been in previous tests, but it remained constant from 2.85 to 2 r.p.m. It then slightly increased as the speed was further lowered, and remained constant from 1.87 to 1.66 r.p.m. From here on it gradually increased, but remained very low until the speed had been reduced to 1.01 r.p.m. At this low speed the friction coefficient was about one-third as great as the minimum value that had been obtained when the bearing had been run steadily for a whole day at 1 r.p.m.

On Saturday the test was begun at 1.5 r.p.m. and continued for 30 min. The coefficient was less than at same speed the previous day. This is explained by the assumption that the surfaces improved during the lower speed runs following that at 1.5 r.p.m. on Friday. At 1.25 r.p.m. the friction was still considerably less than the previous day. At 1.05 r.p.m. it was nearly as great as on Friday. At 0.88 r.p.m. it was increased about 75 per cent and continued to increase rapidly as the speed was lowered until 0.38 r.p.m. was reached. The motor was not belted to run slower than this, so that the run at this speed was continued. The friction coefficient at 0.38 r.p.m. gradually decreased as it had done at other speeds, indicating continued improvement in the bearing surfaces. The runs for Thursday, Friday and Saturday are plotted in Figs. 15, 16 and 17 of the complete paper.

No serious attempt has thus far been made to measure the starting friction. Some preliminary tests, however, have shown that it will vary with the length of time the bearing has been at rest.

The results of the tests already carried out indicate that the lower the speed at which the bearing is run continuously, the better the condition of the bearing surfaces. Speeds as low as 0.38 r.p.m. have thus far been employed and further tests will be made with yet lower speeds. Reference to the shoe areas mentioned in an earlier paragraph will show the range of pressures it is intended to employ. They will extend from the initial test of 132 lb. per sq. in. and a light oil to as high as 2000 lb. per sq. in. with a light and a heavy oil. The tests with the light oil will be continued as far as they lead to valuable results, then the tests will be run on heavy oil. When the tests are completed on the light oil, it will be easier to estimate how heavy an oil will be needed for continuing the tests. The author is gratified with the excellent showing made with a light oil, and is glad that he did not begin the tests with a heavy oil.

NEWS OF THE ENGINEERING SOCIETIES

Reports of Meetings of American Welding Society, American Paper and Pulp Association, Iron and Steel Institute, Illuminating Engineering Society, etc.

National Machine Tool Builders' Association

That business throughout the machine-tool industry has shown a steady gain since the beginning of the year, was the general consensus of opinion at the eighteenth annual convention of the National Machine Tool Builders' Association, held in New York on October 15 and 16. It was also brought out that, contrary to what was expected at the outset, the surplus equipment in the possession of the Government at the close of the war has not worked a material hardship upon the machine-tool industry, and that the remainder of this equipment yet to be disposed of ranges in value from \$25,000,000 to \$50,000,000. Of special interest was the report on the conditions of the machine-tool industry in Europe, presented by Alexander Luchars, president of The Industrial Press, who had returned recently from an extended trip of investigation overseas.

Association of Railway Electrical Engineers

The eleventh annual convention of the Association of Railway Electrical Engineers was held in Chicago on October 28 to 31. Among the committee reports presented there were three covering the various phases of electric-headlight operation and one on the subject of railroad electrification. The question of electric-headlight operation was of particular interest this year as the time is rapidly approaching when all locomotives must be equipped with high-power headlights to conform with the ruling of the Interstate Commerce Commission. The standards recommended by the Committee on Electric Headlights included those for generator baseplates, steam-pressure ranges, ball bearings, brush sizes and steam-pipe openings. The report of the Committee on Railroad Electrification contained a typical skeleton form for an electrification report, which was intended to serve as guide in procuring all data necessary to an intelligent and comprehensive conclusion and recommendation, together with a bibliography of articles and papers referring to steam-railroad electrification which have appeared in the American and foreign technical press during the years from 1908 to 1919.

American Welding Society

A meeting of the American Welding Society was held on October 24, at the Engineering Societies Building, New York, N. Y. The program comprised various addresses on the progress and development of the welding industry, and an account by Prof. Ralph G. Hudson of a series of investigations he conducted at the laboratories of the Massachusetts Institute of Technology, in which his efforts were mainly directed to the determination of the cause and nature of the transmission of metal from an electrode to a plate. According to the theory developed by Professor Hudson in consequence of his investigation, the function of the electric current is nothing more than that of furnishing heat in the form of the electric arc. The welding is accomplished by metal that is expelled from the electrode in the form of metallic vapor and minute liquid particles which are shot across to the plate opposite at the rate of some fifty a second. The force that propels these particles is the pressure that arises from the sudden formation of vapors and gases under the intense heat of the arc. Carbon monoxide is the gas mentioned, and the vapors are those of the lower-melting constituents of the electrode. The particles that strike fluid metal on the plate solidify with it; but those that strike solid metal either bounce off and are wasted, or adhere without fusion and are a cause of bad welding. One great advantage of maintaining a short arc, Professor Hudson observed, lies in the fact that it secures a better concentration of the projected particles within the fluid spot on the plate.

American Paper and Pulp Association

A committee report presented at the annual conference of the American Paper and Pulp Association, assembled in New York on November 14, contained a plan for the conservation of the United States forest capital, which, in the statement of the committee, is being used up faster than it is replaced. The suggestions proposed embraced:

1 A forest survey and land classification
2 A great enlargement of the public purchase of cutover lands for which ample precedent has been established in the East by both the Federal Government and by some of the states. The best interests of the country would seem ultimately to require at least twice the present area of public forests
3 A much more general extension of Federal coöperation with the states in fire prevention
4 The states should do much more than they now do in the way of fire control
5 The states, through the adoption of uniformly fair forest taxation laws, the establishment of forest nurseries, and the preparation of forest working plans, should offer every possible encouragement to the owner who wishes to grow timber on his land
6 Very properly the most immediate concern is the protection of the timber we already have, but wherever sufficient fire protection can be secured a large program of forest planting should be carried out.

In conclusion, the committee outlined methods of fire protection in the Northeastern States, and urged that immediate steps be taken to unite the professional foresters, the lumberland owners and the consumers of forest products upon a program of forest-fire protection and acquisition of cutover lands.

International Trade Conference

According to statements made by the trade representatives of the allied countries at the International Trade Conference, held in Atlantic City under the auspices of the Chamber of Commerce of the United States on September 30 to October 6, Europe will probably not require as much of American materials for its reconstruction period as it has been generally believed in the United States. Even before such requirements as the European nations may purchase in this country are finally provided, it will be necessary to find means of financing this business and extending credits over possibly a long period of years. Finance was concluded to be the crux of the entire international problem and the very thing upon which depends the reduction of the enormous trade balance piling up in favor of the United States. Great Britain, it was found, will not need much American assistance, except as this country can relieve her of some of the burdens of caring for the other European nations while Great Britain is engaged in settling her own problems. France, Italy, and Belgium need American aid and need it badly, but, as was emphasized by not only the visiting speakers, but by the American participants in the general program, this

assistance is not the kind required by weak, characterless nations, but by nations of strength and ability suffering from the ravages and privations caused by the war with Germany. Help will be given these countries, it was declared, — just how is not known, but help will be extended. This was made clear time and again in the addresses given by the business men of the United States.

American Iron and Steel Institute

The principle of the open shop as advocated by Judge Gary in the steel strike and before the industrial conference at Washington was enthusiastically indorsed by the American Iron and Steel Institute at its sixteenth general meeting, held in New York on October 24. Resolutions were formally adopted, in which the Institute recorded "its unqualified approval of Mr. Gary's firm stand against any infringement of the rights of the individual in labor or in business, rights fundamental to American industrial supremacy as well as to American liberty."

Recent applications of metal radiography were outlined by W. E. Ruder, research metallurgist of the General Electric Company, Schenectady, N. Y. He referred particularly to an experiment made in order to determine the thickness of the smallest air inclusion which could be distinguished radiographically. Two plates of steel were machined and ground to flat surfaces. In one of these a slot was cut to give a wedge of air of varying thickness. Each plate when finished was 5/8 in. thick. The two plates were then bolted together and radiographed at a 15-in. gap. In this manner it was found that a 0.021-in. air inclusion could be detected at 1 1/4 in. of steel and a 0.007-in. air inclusion in a total thickness of 5/8 in. of steel. This was, of course, under the most favorable conditions, when it was known beforehand that the inclusion existed and just where it was.

In a paper on Testing Steel by Magnetic Analysis, R. L. Sanford, associate physicist, United States Bureau of Standards, described a method for determining the degree of magnetic uniformity along the length of a specimen of substantially uniform cross-section, such as a rail. The test consists of surrounding the specimen with a magnetizing solenoid which is run along the specimen. A sensitive electrical instrument which is connected to a test coil carried with the solenoid indicates any change in magnetic permeability of the specimen as the coil moves along. The conclusions so far warranted are, according to Mr. Sanford, that a bar which is magnetically uniform along its length is also mechanically uniform, that a bar which is mechanically non-uniform along its length is also magnetically non-uniform and this non-uniformity will be surely indicated by the test; and finally that bars which are magnetically non-uniform may or may not be seriously defective from the mechanical point of view. The Bureau is conducting further investigations in coöperation with the ordnance department of the United States Army.

King Albert of Belgium attended the banquet as the guest of honor and gave a message of good-will and of appreciation of the American steel and iron industry. Another guest of distinction was M. Eugene Schneider, head of the Creusot works of France, and president of the Iron and Steel Institute.

Illuminating Engineering Society

The thirteenth annual convention of the Illuminating Engineering Society was held at Chicago, October 20 to 23. The report of the Committee on Progress expressed the hope that the reaction from the restricted lighting which war conditions compelled, either from the necessity of saving or conservation, would be in the direction of a demand for a higher standard of illumination, both indoors and out. "The results of higher illumination intensities in increasing factory production, as reported to this Society," continued the report of the committee, "are being recognized as evidence of the necessity for increasing the foot-candle values ordinarily considered satisfactory for this class of lighting. The Inspector of Factories in British Columbia has called attention to the desirability of better industrial lighting, and, that in many cases such as sawmills where electric generators are part of the equipment, the lighting is so inadequate that the inspector has had to be furnished with a lantern in order to see well enough to perform his duties." The records of improvement presented by the committee took up the progress made in the gas and electric fields in the development of fixtures for special illuminating purposes, industrial as well as scientific, standardization and the recent designs of powerful searchlights.

In a paper on Glare Measurements, Ward Harrison, Illuminating Engineer, National Lamp Works, Cleveland, Ohio, presented data showing the range of agreement in opinion among a number of observers as to the glare from bare lamps and other more diffuse light sources, in comparison with a reference source of variable intensity. The set-up consisted merely of a row of ten or twelve light sources of varying intensity, some bare lamps, some frosted lamps, and some lamps in globes or reflectors. All were lighted and the observer was asked to state which of the sources he deemed most objectionable from the standpoint of glare. The source named was then extinguished and he was requested to point out the most glaring of those which remained, and so on until but one was left burning. The unexpected feature of this investigation was that practically all of the observers asked to have the lamps turned out in precisely the same order; in fact, there were but three or four cases among fifteen observers where a difference of opinion existed as to the relative standing of any two light sources. Mr. Harrison concluded with a discussion of the practicability of making a rough classification of lighting installations into groups according to the sensation of glare as registered by a small instrument based on the method of comparison followed in his experiments.

Arthur H. Compton, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., described a photoelectric photometer. He noted the difficulties which heretofore have prevented the use of the photoelectric cells in routine photometry, and suggested the use of a thermionic amplifier to increase current readings, also a filter to reduce the proportion of blue light and render the indications proportional to the photometric value. With such equipment, lamps are compared by varying their distances to the cell, until the deflection of the galvanometer is the same as that given by the Standard lamp.

American Railway Bridge and Building Association

The American Railway Bridge and Building Association convened at Cleveland on October 21 to 23. Welcoming the association to the city, D. C. Moon, assistant to the federal manager of the New York Central at Cleveland, emphasized the necessity of exercising practical sense in applying the technical principles of engineering. "My personal observations and experience," he said in part, "led me long ago to feel that, as between the so-called practical 'horse sense' and the technical or book knowledge, I would select the man with the former qualifications for a majority of the jobs. One can buy books and technical knowledge, but he cannot buy brains. The purely technical man has usually proven a costly theorist, as many an employer has found out to his sorrow. But the practical man has moved along on safe lines and been the employer's benefactor. Strive to be a combination man in every sense, and with that you surely will be a success. Study formulæ and technique, for they must be used, but don't forget to keep your mind working on the practical side of every job."

Comparing the internal-combustion engine with the steam engine as source of power in a railroad plant, C. A. Lichty, of the purchasing department of the C. & N. W. Ry., said that while the cost of installation is about equal for either type in the small plants or may be even higher for the internal-combustion engine in installations of from 20 to 50 hp., nevertheless the oil engine is much more economical in the matter of attendance and operates more efficiently than the steam engine, and considerably less space

is required for the storing of the oil fuel than for the transportation and storage of coal. A wide difference of opinion developed in the discussion of Mr. Lichty's paper. E. A. Demars, of the Oregon Short Line, favored steam plants because they require less-experienced operators. He stated that he had found trouble in securing men sufficiently trained and experienced to operate and maintain gasoline engines. J. P. Wood, of the Pere Marquette Railway, stated that he had found gasoline engines to be more economical than steam for small stations. He employed section foremen to run engines at a number of minor points on that road and had found that they were able to do this work satisfactorily. In larger stations where standpipes are installed he favored steam plants, largely because of his practice of piping exhaust steam to the standpipe pits to prevent their freezing in extreme cold weather. C. R. Knowles, I.C. Ry., presented data showing the comparative costs of operating a gasoline station pumping 200,000 to 300,000 gal. of water per day — which was operated originally by steam and recently changed over to an oil engine—which showed a reduction in fuel cost of over $1000 per year under identical conditions. G. W. Andrews, of the Baltimore & Ohio, stated that there are a number of points on his road where gasoline plants are not practicable, as they are flooded at certain seasons of the year. He referred to one line of 100 miles on which there are five water stations which have been under water five times this year. He uses steam plants at these places in order that the stations can be operated even when under water. In general, he favored the use of gasoline engines for ordinary locations. Mr. Knowles and others pointed out the fact that oil-burning engines can be operated on lines subject to floods by placing the pumps in waterproof pits and locating the engines above the high-water level, this arrangement giving much higher efficiency than operating steam pumps under water.

The committee reports on painting metal railway structures and on the economical use and storage of fuel at railway pumping stations contained information of much interest and many valuable suggestions which can well be applied to similar practices outside of the railway industry.

Sir John Wolfe Wolfe-Barry

The accompanying portrait of Sir John Wolfe Wolfe-Barry was presented to the American Engineering Standards Committee by the British Engineering Standards Association, whose destinies he so ably guided through long years from its beginning in 1901 as a committee of nine. That committee inaugurated by Sir John has developed into the present Association which numbers some twelve or fourteen hundred members and over three hundred committees, covering all the branches of engineering and allied industries.

Sir John Wolfe Wolfe-Barry, K.C.B., F.R.S., was the doyen of the engineering profession of Great Britain. Past-president of many of the learned societies, he always took the greatest interest in the younger members of the profession and probably is more responsible than any other man for the status of engineering generally.

His father was the architect on the Houses of Parliament and the well-known Reform Club. He himself was more closely identified with transportation facilities than with any other branch of engineering and in this connection first place may be given to the railways in and around London. He was responsible for the work of carrying the South-Eastern Railway across the Thames into Charing Cross and Cannon Street Stations and also for the construction of Tower Bridge. For the latter work he studied and developed the bascult system for the opening span, determined, as the result of many experiments, the load which could be safely imposed upon London clay, and made careful observations on the subject of wind pressure. He was also chairman of the Arbitration Board which resulted in bringing about the Metropolitan Water Board of London.

Much of Sir John's time was devoted to dock construction and there are few ports in Great Britain or her colonies in which his influence as designing, executive, or consulting engineer has not been felt.

His death on January 22, 1918, ended a long and exceedingly active life. He contributed greatly to the commercial prosperity

Sir John Wolfe Wolfe-Barry

of the United Kingdom, advanced the science of engineering particularly in relation to transportation and helped to raise the profession to a higher status. Throughout his life, Sir. John showed a singleness of purpose in giving his time and experience for the general good of the community by serving on commissions and by utilizing every opportunity to inculcate principles whereby the natural wealth and physical energy of the nation might be economized.

Correction to Paper on Octaval Notation in Shop Measurements

In Mechanical Engineering for November there appeared on page 871 an illustration with the caption —"Fig. 2 Simple Vernier Calipers." The illustration showed, however, a simple calipers

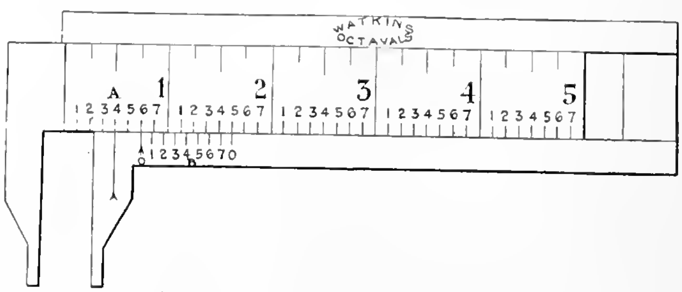


Fig. 2 Simple Vernier Calipers

to which reference was made in the complete paper, that appearing in the November issue being only an abstract. The correct figure is reproduced herewith.

ENGINEERING COUNCIL

Engineering Council[1] is an Organization of National Technical Societies of America, Created to Consider Matters of Common Concern to Engineers, as Well as Those of Public Welfare in Which the Profession is Interested

Classification and Compensation of Federal Engineers

Employed professional engineers have found themselves unprepared to meet the changes in economic conditions which have occurred during the last few years, but they are now endeavoring to bring about increases of compensation so as to sustain themselves according to previous standards of living and to adjust the hitherto inadequate salaries of positions to their responsibilities. To help correct these unfavorable conditions, Engineering Council organized, in April last, a Committee on Classification and Compensation of Engineers, of which Arthur S. Tuttle, Deputy Chief Engineer, Board of Estimate, New York City, is chairman.

The committee is divided into three sections — State and Municipal, Railroad, and Federal Government. The last-named of these, which is headed by John C. Hoyt as chairman, has just issued a preliminary report, which should receive the careful attention of every engineer so that the final report may serve as a basis for a rational system of classification and the establishment of adequate compensation for all branches of engineering.

Space prohibits more than a brief summary of the report, but it is the hope of the committee that many may see fit to offer their criticisms and suggestions, for it is highly important that every engineer interest himself actively in this subject, because the right solution of the problem is essential to the welfare of the individual and necessary in keeping the standards on a high plane.

Briefly the report indicates the lack of an adequate or consistent employment policy with respect to engineers and other technical employees in the Government service. This is shown by the following conditions, which are believed to be largely responsible for the unsatisfactory status of this class of Government employees:

1 Absence of any system of grading of positions.

2 Lack of uniformity in classes of positions and in their titles and duties.

3 Inequalities in compensation for positions of the same grade in different organization units.

4 Generally inadequate compensation for services rendered.

To the end that these conditions may be corrected and proper and equitable conditions of employment established for engineers, as well as for other Government employees, the following practices and principles are recommended:

1 Positions should be classified in accordance with the character of the duties to be performed and with the training and experience necessary for their performance, as indicated by a system of grading.

2 Within the salary limits fixed for each grade, there should be a system of advancement through the grade based upon experience gained in the position and upon proof of increase in the proficiency of the employee in performing the duties of the grade.

3 Promotions from grade to grade should depend upon the existence of a vacancy in the higher grade and proof that the employee is qualified to fill the vacancy.

4 The determination of adequate salary schedules should take into account and properly weigh the following basic considerations:

(a) The capital invested, both in money and in time, in obtaining the requisite fundamental training.

(b) The amount and character of experience and the degree of personal ability required.

(c) The relative value of the classes of work to be performed.

(d) The amount paid for work of a similar nature in private employment.

(e) The amount necessary to enable the employee to maintain a standard of living commensurate with the general standards of the community for positions carrying similar dignity and responsibility.

(f) The amount necessary to procure for and retain in the Government service a class of employees capable of conducting the business of the Government with an efficiency and a spirit of initiative equal to that of private business.

5 In the interest of an adequate social policy, no position likely to be occupied by individuals of an age to assume family responsibilities should fail to pay an amount sufficient to permit the maintenance of the average family in reasonable decency and comfort.

6 In the interest of the employees as a whole and of the proper conduct of the work of the Government, a system should be established by which employees who fail to maintain satisfactory standards of service should be removed, transferred, demoted, or retired as may be equitable in the circumstances.

Numerous tables and charts comparing salaries and grades of both past and present form an interesting and valuable part of the report, and one showing the tentative recommended salary schedule is reproduced below as Table 1.

TABLE 1 TENTATIVE RECOMMENDED SALARY SCHEDULE

Titles of Positions	Minimum Years of Service in Grade	Minimum Salary of Grade	Maximum Salary of Grade	Total Promotion between Grades
PROFESSIONAL GRADES				
1 Chief Engineer		8100	and up	
				2160
2 Engineer	4	5940	7860	
				1620
3 Senior Assistant Engineer	3	4320	5760	
				1620
4 Assistant Engineer	3	2700	4140	
				1080
5 Junior Assistant Engineer	2	1620	2580	
SUB-PROFESSIONAL GRADES				
6 Aid	3	1680	2400	
				600
7 Junior Aid	2	1080	1560	

NATIONAL SERVICE COMMITTEE

Contributed by the Washington Office[1]

Engineering Appropriations, 66th Congress

A number of items of vital importance to engineers were included in the first deficiency appropriation bill. They are as follows: $2,950,000 for the prevention of forest fires; $175,000 for industrial research, industrial safety standards and standardization of scientific instruments at the Bureau of Standards; $250,000 for repair of naval vessels. The following items were changed in conference: Alaskan Railroad appropriation was reduced from $17,000,000 to $6,000,000; Army Air Service appropriation of $15,000,000 was entirely eliminated and the appropriations providing for 33⅓ per cent increase of pay for draftsmen in the Navy Hydrographic Office and engineers in the Coast and Geodetic Survey Office were also eliminated.

The Alaskan Railroad appropriation was reduced because $6,000,000 is all that will be needed during the current fiscal year and the balance of the $17,000,000 required to complete the work will probably be taken care of in the next regular Sundry Civil bill.

[1] Officers of Engineering Council: J. Parke Channing, *Chairman*; Alfred D. Flinn, *Secretary*, Engineering Societies Building, 29 West 39th Street, New York.

[1] Washington Office in charge of M. O. Leighton, *Chairman*, National Service Committee, McLachlen Building, 10th and G Streets.

The appropriation for the Army Air Service was eliminated because it was contemplated that this service will be cared for in the future by a regular appropriation bill covering this special subject.

The total amount appropriated under the provisions of the first deficiency appropriation bill was $29,461,035.85. This is a reduction of almost 50 per cent from the bill which was originally passed by the Senate.

Mileage Pay for Engineers

After the National Service Committee of Engineering Council announced that it was prepared to look after the interests of engineer officers who were required to travel long distances to their first stations but were never paid for such travel, a large number of letters giving evidence in the case were received and used as evidence.

Arrangements were completed whereby a bill was drafted to care for the engineer officers who had lost heavily on this score. This measure was approved by the Adjutant General, Chief of Engineers and the Chairman of the Military Affairs Committee of the House, but has not been reported to the House calendar because of press of other business before the Military Affairs Committee.

Assistance to Civilian Aviators

Bills have recently been proposed in both Houses of Congress, authorizing the Secretary of War to sell at contract prices, plus 10 per cent, gasoline, oil, and aircraft supplies to civilians in charge of aircraft who land on or near aviation stations. He is to promulgate rules for the distribution of this coöperation, but with the special provision that the amount so sold is to be limited to the immediate needs of the aviator to enable him to get to the nearest point where supplies can be purchased.

This, together with the weather bulletins provided the Air Service through the Weather Bureau and the maps that are being prepared by the Government to assist aviators, should be a boon to civil aviation. These things show a distinct attitude on the part of the Government to assist aeronautical development as much as possible.

Road Building for 1920

A total of $633,000,000 is now in sight for road-building purposes during the year of 1920. The Bureau of Roads arrives at this estimated total expenditure as follows: brought forward from unfinished work, $165,000,000; available from state and county taxes and federal aid, $273,000,000; one-fifth state and county bond issues not before available, $50,000,000; one-third unexpended balance of state and county bond issues, previously available, $45,000,000; available from new bond issues to be voted on during the remainder of 1919 and early part of 1920, $100,000,000.

The United States Geological Survey will assist the Bureau of Roads by stimulating the production of road-building material if they can obtain the funds that will be required for this purpose. It has now become apparent that unless greatly increased production of road-building material is secured in the near future, full advantage of transportation facilities as well as the funds that are available cannot be had.

According to the records of the Bureau of Roads each month breaks the record of new roads started and completed under the extensive road-building campaign of the state and federal governments.

Chamber of Commerce to Erect New Building

The Chamber of Commerce of the United States is preparing to erect a building in Washington, D. C., to serve as the permanent national headquarters. This building will be a large and dignified structure, and is designed to commemorate the part taken by American business and industry in the Great War. The site selected for this building is at the corner of Connecticut Avenue and H Street, just across Lafayette Square from the White House, the State, War and Navy and other Government buildings. Of dignified classical architecture, the building will be five stories high, and is estimated to cost $2,500,000. Mr. Cass Gilbert, of New York, is the architect.

Engineers are interested because Engineering Council is a member of the National Chamber, and as such, has the privilege of using all the facilities of the Chamber's offices in Washington for the benefit of its member societies. The site for the new building has been purchased, and a campaign to raise the balance of the funds needed is soon to be made. Engineering Council bespeaks the coöperation with the Chamber of such engineers throughout the country as can help. Harry A. Wheeler, vice-president of the Union Trust Company, Chicago, Ill., is the chairman of the Committee on Financing Building.

National Research Council Reorganizes Its Division of Engineering

The Division of Engineering of the National Research Council has recently been organized, and Prof. Comfort A. Adams, Dean of the Harvard Engineering School and a past-president of the American Institute of Electrical Engineers, is now chairman. He replaces Dr. Henry M. Howe, who formerly headed the Division, Dr. Howe having been made Honorary Chairman. Mr. Galen H. Clevenger still retains the vice-chairmanship.

The work of the Division is progressing along many lines, perhaps the most important of which is the investigation of the fatigue phenomena of metals. An agreement has now been reached by the University of Illinois, the Engineering Foundation, and the National Research Council under the terms of which Engineering Foundation is to give $15,000 a year for two years to carry on this work and the University of Illinois is to contribute the use of its laboratories and the services of Professor Moore, the chairman of the Division's Committee on the Fatigue Phenomena in Metals. The work will be done under the direction of the Division of Engineering. A report as prepared by the committee, and which summarized the available facts and theories relating to fatigue failure, and discussed some of the unsolved problems, appeared in the September issue of Mechanical Engineering.

The relation of the Division of Engineering to other organizations engaged in research in the field of engineering is also receiving considerable study, to the end that the research work of the various societies and organizations may be properly coördinated. Eight national engineering societies are now represented in the Division, among them being The American Society of Mechanical Engineers, and in order to bring about a larger measure of coöperation other societies and organizations engaged in engineering research will shortly be invited to appoint representatives.

Research Work in Alloys

The Division of Industrial Research of the National Research Council is arranging for the formation of a coöperative association to plan and support fundamental reseaches in alloys. Although much valuable work has been done in this field by scattered investigators, there is no doubt but that a well-planned and coordinated effort under the general guidance of the National Research Council and composed of specialists representing both the manufacturers and the more extensive users of alloys can produce additional results of great importance. The success of other industries which have supported research on a coöperative plan, such as has been done by the National Canners' Association and the Malleable Iron Manufacturers, is evidence of this fact.

It is planned to create a special scientific staff composed of a Director and Assistant Director of Research and a group of scientific investigators and technical experts who will give their whole time to the work. To finance the organization each member of the coöperative association will pay $1000 a year, and all contributing members, who may be either alloy, manufacturing or using individuals, firms or companies, are to benefit alike by the results of the researches.

NECROLOGY

HENRY LAURENCE GANTT

Henry L. Gantt, an industrial engineer of national reputation and a former manager and vice-president of the Society, died suddenly on the evening of November 23 at his home in Montclair, N. J., of heart disease.

Mr. Gantt was born in Maryland in 1861. He received his B. A. degree from the Johns Hopkins University in 1880 and was graduated from the mechanical engineering course at Stevens Institute of Technology in 1884. In association with Frederick W. Taylor he helped to install modern methods of manufacture at the plant of the Midvale Steel Company and at other large industrial establishments. During the war, as production advisor to the Government, he developed a new and effective method for the rapid production of war materials.

Mr. Gantt was a member of the Society of Naval Architects and Marine Engineers, the American Geographic Society, the Engineers' Club and the Machinery Club. He became a member of our Society in 1888 and later held the office of manager (1908-1911) and that of vice-president (1913-1915).

A more extended account of Mr. Gantt's career will appear in the January issue of Mechanical Engineering.

WILLIAM FRANKLIN AUSTIN

William F. Austin, a member of the Society since 1905, died on July 12, 1919. Mr. Austin was born on October 2, 1864, in East Greenbush, N. Y. He received his early education in the public schools of Rensselaer and later supplemented this by a correspondence course in mechanical engineering. He served his apprenticeship with the Central Bridge Company, Buffalo, from 1882 to 1884, when he became connected with the Hilton Bridge Company, Albany, first as foreman of their drafting room and later of the erection department. In 1894, Mr. Austin became superintendent of the Albany plant of the American Bridge Company, and in 1905 superintendent of the Eddystone plant of the Belmont Iron Works, where he was located for about eight years, when illness compelled his giving up active business life.

WILLIAM FRAZIER CARPENTER

William F. Carpenter, vice-president of the Pittsburgh Testing Laboratory, died suddenly on October 10, 1919. Mr. Carpenter was born in 1857 in Staten Island, N. Y. He was graduated from Stevens Institute of Technology in 1876 and took his first position with the Ramapo Iron Works. From there he went to Pittsburgh and started the Kent Construction Company and later the Pittsburgh Testing Laboratory. For a number of years he was associated with the Westinghouse and Electric Manufacturing Company, holding very responsible positions. He was also connected with the St. Lawrence Power Company as vice-president and general manager and acted as consulting engineer for the Spokane and Inland Empire Railway Company. He then returned as vice-president to the Pittsburgh Testing Laboratory, which concern he himself had established many years before.

Mr. Carpenter (who, in 1918, had his name changed from Zimmerman) was one of the original members of the Engineers' Club of New York. He became a member of the Society in 1884.

JOHN ARTHUR HALL

John Arthur Hall, a member of the Society since 1916, died on October 1, 1919, of injuries received in an automobile accident. Mr. Hall was born in Pittsburgh, Pa., on September 16, 1877. He was graduated from Sheffield Scientific School, Yale University, in 1897, and after a year of graduate study became associated as chemist with the Carnegie Steel Company, Pittsburgh. From 1902 to 1915 he was connected with the Tennessee Coal, Iron and Railroad Company, as superintendent of the Alice Furnaces, with the Edison Portland Cement Company as chemical engineer and with the Ransome Concrete Machinery Company as superintendent in charge of production. More lately, Mr. Hall has been engaged in business under the firm name of the Hall Machine Company, general machinists.

WALTER W. KREISER

Walter W. Kreiser was born on July 23, 1892, in Jersey City, N. J. He was prepared for college at Stevens Preparatory School and then entered Stevens Institute of Technology, from which he was graduated in 1916 with the degree of M.E. He spent a year in chemical research work and then became connected with the mechanical engineering department of the Western Union Telegraph Company, New York. In September 1917 he became assistant engineer of tests in the Brooklyn Navy Yard. Here, while performing his regular duties in the mechanical laboratory, he was injured by falling into a manhole carelessly left open, and, after an eleven-months' illness, died on October 11, 1919.

Mr. Kreiser was a member of the American Chemical Society. He became a junior member of our Society in 1916.

FRED A. LARKIN

Fred A. Larkin was born in Mason, N. H., on December 2, 1850. He was educated in Massachusetts schools and gained his technical knowledge through special instruction. He served an apprenticeship in shop practice, and for three years served as engineer in charge of engines and boilers in manufactories.

He then became connected with the Allis-Chalmers Manufacturing Company, Milwaukee, representing them in New York. For a number of years he was connected with the General Electric Company, and for two years was with the Foundation Company, New York.

Mr. Larkin was a member of the Engineer's and also of the Republican Club. He became a member of the Society in 1888.

JULIAN H. PITKIN

Julian H. Pitkin, a son of Judge Stephen H. Pitkin, was born at Lewiston, Ill., on July 4, 1839. When a boy, the family moved to Hudson, Ohio, and here he attended the Western Reserve College of which his grandfather, the Rev. Caleb Pitkin, was one of the founders.

He learned the machinist's trade and took a special course at the Polytechnic College of Pennsylvania, working for a year in some of the best shops in the East for experience. For several years he was with Altman Miller & Co., Akron, Ohio, in charge of the tool department. He then became connected with C. Altman & Co., Canton, Ohio, in a similar capacity. In 1886 he was called to the During Harvester Company, Chicago, Ill. (now a part of the American Harvester Company), where he held the position of assistant general superintendent in charge of manufacture, later being transferred to the experimental department.

During all these years of service, in addition to his regular duties, he was engaged in the design and perfection of new machinery. His efforts in these lines were honored by medals from Paris and the St. Louis Expositions.

Shortly after his retirement from the Harvester Company, the engineering department of the Civil Service of Chicago offered him the position of counsellor regarding plans and construction of new city shops. For many months he made a close study and inspection of plans and work, which resulted in a municipal plant as efficient as that of the most highly organized private corporation.

Mr. Pitkin was a member of several clubs and fraternal organizations, among these being the G. A. R. He was formerly a member of the Society, joining in 1883. — J. S. L.

BARTON J. ROBINSON

Barton J. Robinson, manager and proprietor of B. J. Robinson's Machine Works, Vicksburg, died on October 4, 1919. Mr. Robinson was born in Claiborne County, Miss., on February 14, 1868. He received his early education in the New Orleans Schools, and served his apprenticeship as a machinist with the Shakespeare Iron Works, New Orleans, later attending night school to perfect himself in his chosen trade.

In 1896, after spending a number of years in machine-shop and railroad work, he started in business for himself under the firm name of B. J. Robinson's Machine Works, specializing in rebuilding saw-mill and cottonseed-oil mill machinery.

Mr. Robinson was prominent in fraternal circles and belonged to several local business organizations and clubs. He became an associate member of the Society in 1917.

RICHARD CHARLES VIET

Richard C. Viet, head of the marine department of the Standard Oil Company, New York, died on August 29, 1919. Mr. Viet was born in New York City on November 17, 1855. He was educated in the public schools of the city, and when comparatively young secured employment with the firm of Rockefeller, Andrews & Flagler, the predecessor of the Standard Oil Company, with which concern he remained for fifty-two years. He was advanced from one position to another, gradually acquiring a comprehensive grasp of the oil industry. In 1880 he was made chief of the lighterage department at the time when the Standard Oil Company had its beginning. For many years Mr. Viet was a director of the company and in 1911 he became secretary.

Mr. Viet was affiliated with various philanthropic institutions, among these being the old J. Hood Wright Memorial Hospital, the American Museum of Natural History, the Metropolitan Museum of Art and the New York Zoölogical Society. He was a member of a number of clubs and social organizations. He became a member of the Society in 1891.

LIBRARY NOTES AND BOOK REVIEWS

AIR NAVIGATION. Notes and Examples. By Capt. S. F. Card. Longmans, Green & Co., New York, 1919. Cloth, 6 x 9 in., 149 pp., illus., tables, map.

An elementary textbook of navigation for airplane pilots, which presents the methods and the course of instruction used in training the officers of the British flying service.

APPLIED MECHANICS. By Fuller and Johnson. Vol. II. Strength of Materials. First edition. John Wiley & Sons, Inc., New York, 1919. Cloth, 6 x 9 in., 556 pp., illus.

Volume I of this textbook, treating of statics and dynamics, appeared several years ago. The present volume, treating of the strength of materials, covers the fundamentals of this subject, as taught in the engineering departments of the Massachusetts Institute of Technology, in so far as they are required in the study of structural and machine design and in the ordinary problems of engineering practice.

AUTOMATIC SPRINKLER PROTECTION. By Gorham Dana. John Wiley & Sons, Inc., New York, 1919. Cloth, 5 x 9 in., 456 pp., illus.

The author of this volume has attempted to cover the subject in such a way that his book may serve as a textbook for students and also as a reference book for experienced engineers. Starting with a historical summary of the development of the art, he then describes the tests and characteristics of sprinklers, installation rules, layouts, valves, supervisory systems, etc. An appendix lists all types on which information is available and summarizes over six thousand tests of various sprinklers.

CHILTON TRACTOR INDEX. July 1919. Published semi-annually by the Chilton Co., Philadelphia. Paper, 7 x 10 in., 500 pp.

This volume is a directory of the American tractor industry, in which, the editors state, they have attempted to present all the information useful to the industry as a whole. It includes descriptions of power-farm machinery, illustrated descriptions and specifications of tractors and farm implements, and directories of those firms manufacturing implements, tractors, parts, and accessories.

CONCRETE-STEEL CONSTRUCTION. Part I. Buildings. A Treatise upon the Elementary Principles of Design and Execution of Reinforced Concrete Work in Buildings. By Henry T. Eddy and C. A. P. Turner. Second edition. C. A. P. Turner & Co., Minneapolis, 1919. Cloth, 6 x 9 in., 502 pp., illus., tables.

The authors of this volume believe that the fundamental principles underlying the theory of reinforced construction are not generally understood by engineers and the methods of computation of applied bending moments in common use are erroneous. Their book presents what they believe to be the correct analysis of the bending and twisting moments present in columns and flat slabs, a method founded upon the manner of distribution and of the vertical shears that transmit the leading to the supports.

THE CONDENSED CHEMICAL DICTIONARY. A reference volume for all requiring quick access to a large amount of essential data regarding chemicals and other substances used in manufacturing and laboratory work. Compiled and edited by the Editorial Staff of the Chemical Engineering Catalog. The Chemical Catalog Co., Inc., New York, 1919. Cloth, 6 x 9 in., 525 pp.

This volume has been prepared to meet the need for a concise summary of the properties of chemicals, which is felt by exporters, brokers, purchasing agents, manufacturers, and others who require quick access to information on chemical products.

The arrangement of the book is alphabetical and, while the compilers state that no attempt has been made to be exhaustive but merely to give the outstanding facts concerning the chemicals ordinarily met in commerce, approximately six thousand substances are included.

DYKE'S AUTOMOBILE AND GASOLINE ENGINE ENCYCLOPEDIA. By A. L. Dyke. Tenth edition. A. L. Dyke (copyright 1919), St. Louis. Cloth, 7 x 10 in., 940 pp., illus.

It is difficult to imagine any topic connected with the use or repair of automobiles which is not discussed in this comprehensive volume for repairmen and operators. Theoretical considerations are omitted, but an immense amount of practical information is supplied in concise, definite form, illustrated by numerous drawings and charts. In addition to passenger automobiles, the volume treats of trucks, tractors, motorcycles, and airplanes.

FOUNDRY PRACTICE. A Textbook for Molders, Students and Apprentices. By R. H. Palmer. Second edition. John Wiley & Sons, Inc., New York, 1919. Cloth, 6 x 8 in., 390 pp., illus., 40 tables.

This volume is intended primarily for purposes of instruction, rather than as a treatise for experienced foundrymen. The various types of molds are explained and illustrations of the different practices are given. Cupola and air-furnace practice, foundry equipment, methods of mending and cleaning castings are also discussed.

This edition has been enlarged by the inclusion of methods for casting and holding a number of additional articles, such as engine cylinders, propellers, lathe beds, and large kettles.

THE GASOLINE AUTOMOBILE. Prepared in the Extension Division of the University of Wisconsin by George W. Hobbs and Ben G. Elliott. Second edition, completely revised by Ben G. Elliott and Earl L. Consoliver. McGraw-Hill Book Co., Inc., N. Y. Cloth, 6 x 9 in., 483 pp., 1 pl.

Developments in automobile practice during the past four years have necessitated changes in this popular textbook. In addition to the necessary revision, the book has been rewritten and enlarged by the inclusion of several new chapters. In doing this the authors have provided a work on the fundamental principles of automobile design, construction, and operation for the instruction of those who drive, repair, sell, or otherwise have to do with motor cars.

IRON AND STEEL. A Treatise on the Smelting, Refining, and Mechanical Processes of the Iron and Steel Industry, including the Chemical and Physical Characteristics of Wrought Iron, Carbon, High-Speed and Alloy Steels, Cast Iron and Steel Castings, and the Application of these Materials in Machine and Tool Construction. By Erik Oberg and Franklin D. Jones. First edition. The Industrial Press, New York, 1918. Cloth, 6 x 9 in., 328 pp., illus.

This volume, the authors state, is not intended as a treatise for metallurgists and those engaged in the manufacture of iron and steel, but as a textbook for students in technical schools and those engaged in mechanical engineering and machine building. The book provides for these a broad general survey of the industry, with definite practical information on the various commercial grades and forms of iron and steel products, and the particular class of service for which each is suitable.

MARINE GAS ENGINES. Their Construction and Management. By Carl H. Clark. Second edition. D. van Nostrand Co., New York, 1919. Flexible cloth, 5 x 8 in., 136 pp., illus.

This volume is a small manual of convenient size, intended for those who desire a systematic presentation of the principles of operation and construction of the standard types of marine gas engines, from a practical rather than a theoretical point of view. The present edition has been revised to current practice, and material on oil and Diesel engines has been added.

Manufacturers' Instructors and Advisors. By Frederick Meron. Theo. Audel & Co., New York (copyright 1918). Cloth, 3 vols. and portfolio.

Contents: No. 1 — Layouts and equipments for factories, 228 pages and portfolio of 34 plates. No. 2 — Common-sense working methods in factories, 161 pages. No. 3 — The human element in organizations, 351 pages.

The author endeavors to present concisely and clearly the results of his experience in the installation, organization, and operation of industrial plants, with the object of showing, by comparison and illustration, methods for increasing output and reducing expenses.

Papers on the Design of Alternating-Current Machinery. By C. C. Hawkins, S. P. Smith, and S. Neville. Sir Isaac Pitman & Sons, Ltd., London and New York, 1919. Cloth, 6 x 9 in., 392 pp., illus., plates, tables.

Contents: Notes on the Theory and Design of Alternating Current Generators; the Flux Wave-form of the Turbo-alternator with Cylindrical Rotor; Magnetic Calculations for Tapered Teeth; Notes on the Theory and Design of the Polyphase Induction Motor.

Originating out of many discussions on technical subjects, the papers here collected find a connecting link in their common purpose, which is to deal scientifically and practically with problems arising in the design of alternating-current machinery. The point of view throughout is that of the practical designer.

The Principles of Electric Wave Telegraphy and Telephony. By J. A. Fleming. Fourth edition. Longmans, Green & Co., New York, 1919. Cloth, 6 x 9 in., 707 pp., illus., plates, tables.

Dr. Fleming's well-known treatise has again been revised by additions which bring it up to date, while antiquated matter has been deleted in order that the volume might not become unwieldy. The book is a statement of principles rather than a full account of actual apparatus, and is intended to provide a comprehensive view of the subject, particularly with regard to its scientific side, and of that part of it which is concerned with quantitative measurements and the underlying theory.

Steam Turbines. A Practical and Theoretical Treatise for Engineers and Students, including a discussion of the Gas Turbine. By James Ambrose Moyer. Fourth edition, revised and enlarged. John Wiley & Sons, Inc., New York, 1919. Cloth, 6 x 9 in., 496 pp., illus., diag., tables, 1 folded chart.

This edition differs from the preceding ones by containing fuller discussions of the methods of governing, the calculation of the strength of disk-type blade wheels, and of recent developments in marine practice. The text as a whole has also been revised. The general purpose of the volume is to provide the designer, operator, or manufacturer of steam turbines with a concise manual of information based on practical experience.

Timber. Its Strength, Seasoning, and Grading. By Harold S. Betts. First edition. McGraw-Hill Book Co., Inc., New York, 1919. Cloth, 6 x 9 in., 234 pp., illus., maps, charts, tables.

This volume, for engineers, manufacturers and users of lumber and wood material, is intended to meet the lack of a work on wood as a structural material, similar to existing handbooks on steel, concrete, etc. The methods of testing the strength of wood and wood products, such as telephone poles, packing boxes, and vehicle parts, are described and the results of numerous tests by the Forest Service are tabulated. A table based on 130,000 tests, showing the average mechanical properties of 121 American woods, is given. Proper methods of seasoning wood are fully discussed. The grading rules of the different manufacturers' associations are given and the book closes with extensive statistics on the lumber produced and used in the United States.

Waterproofing Engineering. For Engineers, Architects, Builders, Roofers, and Waterproofers. By Joseph Ross. First edition. John Wiley & Sons, Inc., 1919. Cloth, 6 x 9 in., 452 pp., 140 illus., 41 tables.

The absence of any systematic treatise on waterproofing has led to the preparation of this book, which is based on the author's practical experience and researches, as well as his study of the existing literature. The function of waterproofing, the systems in use, methods, and results are described and specification and cost tables are given. A useful glossary of waterproofing terms and a bibliography are appended.

WAGE PAYMENT

(Continued from page 940)

every human activity can be scheduled and analyzed, yet by far the greater part of industrial operations can be treated in this way. The relatively few operations which cannot be classified and treated in this manner would be such a small part of the total that it would be easy to find a way to compromise when such exceptions should occur.

In estimating the value of operations we must drop, to a large extent, the idea that wage is the compensation for time. It should be made a compensation for product delivered. The value of the product changes constantly. Changes may be due to the desirability of the product, or to the means employed to produce the product, or to the law of supply and demand, or to other causes. In other words, the relations existing between various products is ever changing; consequently, whatever estimate is placed on the value of the product of labor should be changed from time to time, so as never to have too large a difference between the actual and the estimated value.

It hardly need be pointed out that to set such standards of value of work must necessarily be a gigantic task. In addition to the many technical difficulties in estimating values of products, there are other elements which must not be forgotten. There are many cases where operations are required which call for extreme skill, possessed by only a few, a skill which can never be found in the mass of the people. There are operations where steady nerves are essential, some where physical courage is required, others which cannot be successfully carried out without many years of experience, et cetera. Such points should all be considered.

Consideration should also be given to what constitutes a proper minimum and a proper maximum wage. In repetition operations it is sometimes possible for the operator to produce large amounts of work, but only at the expense of extreme weariness, and in the long run such a man is not employed to the best advantage of the world at large. Recognition of this fact has led to the prescription of rest periods. On the other hand, there may be cases where it is expedient to employ men not skilled in the operation they are supposed to do. This may happen because skilled men are not available at that time or at that place, or because special conditions call for an unusual amount of this class of work. Though the value of the product of such a man might be low, he should receive not less than a minimum wage. This minimum wage, however, is in itself difficult to determine. A satisfactory minimum wage for an unmarried young man is not at all satisfactory for a married man with a large family.

It is really superfluous to point out the many disturbing factors acting against the establishment of wages in proportion to product. What the writer wishes to emphasize is his belief that, notwithstanding all the difficulties, it will be found possible to classify a large portion of the work of the world in such a manner that wages can be set to such a degree of scientific accuracy that the variations caused by the disturbing facts will not be so large but that they will lend themselves to compromise. It is further his belief that such a classification cannot be accomplished by the employers alone, nor by the laboring men alone, but that when these two classes are working together for a constructive purpose, they will find so many things in common that they will be more apt to forget their differences. Finally, he wishes to state once more this belief: That the real cause of the present-day unrest lies in the fact that there is no unit of measurement which both employers and employees can use; or, in other words, the fact that our present wage system is not based on knowledge and justice, but only on guesswork and on the fear that the one may "do" the other.

Dec. 1920. pp. 1a-38a. 1a

THE ENGINEERING INDEX

(Reg. U. S. Pat. Off.)

Published Monthly by The American Society of Mechanical Engineers

The Engineering Index was Founded in 1884 by the Association of Engineering Societies; Published from 1895 to 1919 by The Engineering Magazine Company; and Acquired January 1919 by The American Society of Mechanical Engineers

THE following pages form a descriptive Index to articles on engineering and related subjects in current periodicals. In its preparation the Society's engineering staff regularly examines all of the technical journals and society publications received by the Engineering Societies Library, which form one of the greatest and most complete collections of scientific periodicals in the world, comprising upward of 1100 distinct publications in some ten languages. Cross-references are freely introduced in the Index, and in all cases where the titles of articles are not sufficiently descriptive, explanatory sentences are appended. The main abbreviations used in the items are given at the bottom of this page.

Mechanical Engineering

AIR MACHINERY

Air Compression

Some Elements of Economy in Air Compression, Wm. Carter. Can. Min. Jl., vol. 40, no. 43, Oct. 29, 1919, pp. 808-809. Observes that in steam-driven air compressors first element of economy lies in using compounded steam cylinders operating under pressures lower than would be advisable in ordinary engine practice.

Utilization of Exhaust Steam for the Direct Production of Compressed Air (Utilisation des vapeurs d'echappement pour la production directe de l'air comprimé). Auguste Dessemond. Bul. et Comptes Rendus Mensuels de la Société de l'Industrie Minérale, vol. 16, no. 3, 1919, pp. 5-32, 23 figs., partly on six supp. plates. Installations resembling scheme developed by Rateau, in which mixed turbine capable of operating with steam at low or high pressure is directly connected to multi-cellular compressor.

Air Compressors

Development of Reciprocating Air Compressors, S. T. Nelson. Eng & Min. Jl., vol. 108, no. 13, Sept. 27, 1919, pp. 533-536, 3 figs. It is said that machines of small capacity were formerly not expected to be efficient and that change from steam to electric drive resulted in many makeshift devices.

Air Pumps

The Marine Air Pump as a Power Factor. Harold C. Walker. Trans. Inst. Mar. Engrs., vol. 31, no. 246, Sept. 1919, pp. 341-358 and (discussion) pp. 358-362, 1 fig. Possibilities and performance of various types studied from vacuum point of view, together with notes on value of air pump efficiency as factor influencing turbine power.

Centrifugal Machinery

Centrifugal Ventilators and Centrifugal Pumps and their Drive (Die Zentrifugalventilatoren und Zentrifugalpumpen und ihre Antriebsmaschinen), V. Hüttig. Gesundheits-Ingenieur, vol. 42, nos. 14 and 15, Apr. 5 and 12, 1919, pp. 141-147 and 153-158, 11 figs. Calculating efficiency and power consumption under changed operating conditions. Suggestions for preventing humming noise and vibration of floor.

Experiments with Centrifugal Ventilators (Versuche an Sachsenwerk-Zentrifugal Lüftern), Hüttig. Gesundheits-Ingenieur, vol. 42, no. 24, June 14, 1919, pp. 241-252, 12 figs. Description of apparatus used for experiments; tables and curves showing results of tests.

Centrifugal Compressor Installation at Newport News Shipbuilding and Dry Dock Co., L. C. Loewenstein. Gen. Elec. Rev., vol. 22, no. 10, Oct. 1919, pp. 785-788. Turbo compressor is operated by exhaust steam from reciprocating engines and precompressed air delivered to reciprocating compressors. Output of compressor plant is said to have been increased in this way by about 50 per cent with very little additional expenditure for fuel, as reciprocating engines were operated non-condensing, a portion of steam being exhausted to air.

Governors

Volume Regulators for Air Compressors, C. S. Darling. Mech. World, vol. 66, no. 1711, Oct. 17, 1919, pp. 184-185. Comparative studies of various regulating systems.

Regulators, Volume

See Governors.

Wind Motors

Windmills. Times Eng. Supp., vol. 15, no. 540, Oct. 1919, p. 307. Their uses and limitations.

Windmills (Vindmollen). Ingeniören, vol. 28, no. 63, Aug. 6 & 9, 1919, pp. 401-408 and 409-411, 11 figs. Formulæ for finding correct skew of sails, power developed by given wind velocity pressure on sails, and velocity of arms. Tables and coefficients offered with view to facilitate calculations. (Concl.)

CORROSION

Boilers and Economizers

Pitting and Corrosion in Boilers and Economizers, F. F. Vater. Power Plant Eng., vol. 23, no 21, Nov. 1, 1919, pp. 963-964. Theories of corrosion causes, examples of pitting, effective preventives and cures.

Condenser Tubes

The Corrosion of Condenser Tubes, G. Costeceque. Eng. Rev., vol. 33, no. 3, Sept. 1919, pp. 60-61. Results of ten years' investigations of corrosion of surface condenser tubes by sea water. Translated from Revista de Obras Publicas.

Economizers

See Boilers and Economizers

Floor Material

Steel Plate Drip Floor for Niagara Railway Arch. Eng. News-Rec., vol. 83, no. 13, Sept. 25, 1919, pp. 620-621, 3 figs. Repairs necessitated by corrosion of floor-beams and stringers due to refrigerator drip and to locomotive blowoff.

FORGING

Die Pressings

The Manufacture of Die Pressings. J. H. Garnett. Machy. (Lond.), vol. 14, no. 362, Sept. 4, 1919, pp. 673-679, 20 figs. Describes advantages of and metals used for die pressings, as well as method for making dies.

Drop Forging

Drop-Stamping, Drop-Forging, etc.—IX, X, Joseph Horner. Mech. World, vol. 66, no. 1707 and 1711, Sept. 19 and Oct. 17, 1919, pp. 138 and 187, 21 figs. Sept. 19: Cast-iron or steel dies with hardened steel insertions. Oct. 17: Bevel-pinion blank.

Forging Temperatures

Forging Temperatures and Rate of Heating and Cooling of Large Ingots, F. E. Bash. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2869-2880, 3 figs. Test carried out on 24-in. round ingot. It was possible to heat ingot from room temperature to forging temperature in 7 hr. No definite conclusion is arrived at as to whether this heat would be injurious to steel, but it is advised that in any particular case question should be decided in light of shop experience.

Furnaces

A Recuperative Furnace for the Forge Shop. Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, p. 495, 3 figs. Furnace designed for economical firing. It employs recuperators of special design for reclaiming heat from waste gases.

Hammer Troubles

Hammer Troubles that Hinder Production. Am. Drop Forger, vol. 5, no. 10, Oct. 1919, pp. 486-489. Such as losses resulting when hammer is not pounding on hot stock. Also board-drop hammers are taken into consideration.

Nickel Chrome Forgings

Nickel Chrome Forgings, J. H. Andrew, J. N. Greenwood and G. W. Green. Iron and Steel Inst., meeting of Sept. 1919, paper no. 1, 93 pp., 26 figs. Investigations of specimens at various stages in process of manufacture are reported and suggestions are formulated relative to various conditions to realize in the castings in order to obtain faultless forgings.

FOUNDRIES

Aluminum Casting

Unsoundness in Aluminum Castings, Robert J. Anderson. Foundry, vol. 47, no. 330, Sept. 1, 1919, pp. 579-584, 24 figs. Results of experiments on porosity and on unsoundness of no. 12 alloy of aluminum, composed roughly of 92 per cent aluminum and 8 per cent copper, interpreted as establishing that number of blowholes present is function of pouring temperature, the higher the pouring temperature the greater being the number of blowholes and the more unsound the casting. It was also determined that unsoundness varies with temperature to which charge is heated, and is function of length of time of melting.

Brass Melting

Considerations Affecting Brass Melting, R. R. Clarke. Can. Foundryman, vol. 10, no. 10, Oct. 1919, pp. 295-298, 2 figs. Things to guard against when brass work is done in iron foundry.

Bronzes, Zinc

Five Foundry Tests of Zinc Bronzes. C. P. Karr. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2485-2492 1 fig. Bur of Standards work with type metal known as "Admiralty bronze" in England and as "Government bronze" in United States and consisting of 88 copper, 10 tin, and 2 zinc.

Centrifugal Casting

Centrifugally Cast Pipe in South America. Iron Age, vol. 104, no. 13, Sept. 25, 1919 pp. 863-865, 7 figs. General features of plants in Brazil and Argentine using DeLavaud process for iron pipe.

Cost System

Practical Up-to-date Foundry Cost System, M. H. Potter. Can. Foundryman, vol. 10, no. 5, May 1919, pp 124-126, 9 figs. Illustrating requisition cards, moulders' cards, delivery sheet, progress record form and similar cards.

Cupolas

Fuel Economy in Cupola Practice. II. James Yates. Iron and Steel Inst., meeting of Sept. 1919, paper no. 2, 7 pp. Concerning making good heat losses (1) from casing by radiation, (2) due to sensible heat in waste gases, (3) resulting from undeveloped heat in unburned carbonic oxide. Also in Colliery Guardian, vol. 118, no. 3065, Sept. 26, 1919, pp. 834-835.

Design

An Achievement in Foundry Design. Gilbert L. Lacher. Iron Age, vol. 104, no. 13, Sept. 25, 1919, pp. 827-832, 13 figs Plant of Busch-Sulzer Bros. Diesel Engine Co. described as notable from viewpoint of equipment, transportation facilities, lighting, ventilation and sanitation.

Die Castings

Die-Casting and Die-Casting Metals. Erik Oberg. Machy. (N.Y.), vol. 26, no. 2, Oct. 1919, pp. 155-160, 11 figs. Also in Machy. (Lond.), Oct. 16, 1919, pp. 65-70, 11 figs. Article describes general organization of plant for making die-molded castings, and reviews metals now commercially used in die-casting practice.

Die-Casting. E. N. Dollin. Mech. World, vol. 66, no. 1711, Oct. 17, 1919, pp. 187-189. Reports of various English plants in regard to composition of alloys for different purposes.

Foreign Foundry Practice

Foreign Foundry Practice Analyzed. A. O. Backert. Foundry, vol. 47, no. 18, Nov. 1, 1919, pp. 769-770. Observes that fundamental differences in buyers' requirements render comparison between American and foreign manufacturing methods unfair unless viewpoint is understood.

Handling of Materials

Mechanical Handling of Foundry Material. Iron Age, vol. 104, no. 13, Sept. 25, 1919, pp. 870-872, 4 figs Plant where manual labor has been replaced by cranes and hoists in handling operations except in cupola charging.

See also Hoisting Equipment

Hoisting Equipment

Handling Foundry Jobs by Crane, W. C. Briggs. Iron Trade Rev., vol. 65, no. 14, Oct. 2, 1919, pp. 889-891, 3 figs. Illustrating uses of hoisting equipment. Paper presented before Am. Foundrymen's Assn.

Individual Plants

Plant of Hull Iron and Steel Foundries. Can. Machy., vol. 22, no. 13, Sept. 25 1919, pp. 316-317, 3 figs. Special feature said to be that works produce practically all of their own raw material. Description of system of recording and cost keeping.

Ingot Mold Foundry

Bethlehem's Ingot Mold Foundry, E. C Kreutzberg. Foundry, vol. 47, no. 330, Sept. 1, 1919, pp. 601-603, 7 figs. Direct metal from blast furnaces as well as cupola metal is used. Special attention is called to arrangement for storing and charging coke.

Lathe Casting

maintained by policy of employing non-union labor and paying piece-work scale which nets industrious workers more than union wages.

Molding

Makes Cope and Drag Simultaneously. Iron Trade Rev., vol. 65, no. 17, Oct. 23, 1919, pp. 1118-1119, 4 figs. Combination jar-ram, squeezer and stripping-plate molding machine.

Jolt Ram Moulding. H Pemberton. Machy. (Lond.), vol. 14, no. 362, Sept. 4, 1919, pp. 689-693, 19 figs. It is said that actual ramming of sand by impact movement of jolt machine results in sand being rammed around pattern in vertical stream lines, thus giving uniformity of packing.

New Molding Machines (Nouvelles machines à mouler). Fonderie Moderne, vol. 12, no. 4, Apr. 1919, pp. 77-80. Described as possessing lifting mechanism and feed and hydraulic motion.

Where Converter Castings Are Made. Foundry, vol. 47, no. 330, Sept. 1, 1919, pp. 608-611, 7 figs Illustrating plan of foundry showing location of molding machines, core room, melting units, power house and annealing ovens.

Pattern-Drawing Machine

Modern Gray-Iron Foundry in Utah. T. F. Jennings. Foundry, vol. 47, no. 330, Sept. 1, 1919, pp. 587-589, 5 figs. Noting special type of stand for holding cheek used in jar roll-over pattern-drawing machine equipped for making castings.

Patterns

Cylinder Patterns. Joseph A. Shelly. Machy. (N. Y.), vol. 26, no. 2, Oct. 1919, pp. 161-164, 9 figs. For vacuum pumps, core-boxes for jacketed cylinders, cylinder heads, cylinder feet and discharge covers.

Pulverized Coal

Powdered Coal for the Small Foundry, A. J. Grindle. Foundry, vol. 47, no. 16, Oct. 1, 1919, pp. 679-680. While quality of fuel is admitted to be an important consideration, conditions under which it is burned are said to be more so.

Records

Following Work Through the Plant. Alexander Mann. Foundry, vol. 47, no. 333, Oct. 15 1919, pp. 742-754, 4 figs. Illustrating system of recording castings in foundry.

Rigs

Special Rig Aids Foundry Output. Iron Trade Rev., vol. 65, no. 12, Sept. 18, 1919, pp. 769-773, 8 figs. Four machines make molds with green-sand cores for tractor transmission housings. Floor space saved by pouring as soon as molds are finished, and shaking out while hot.

Sand Molding

Occurrence and Testing of Foundry Moulding Sands. L. Heber Cole. Can. Dept. Mines, Mines Branch, Bul. no. 21, no. 476, 1917, 17 pp., 20 figs. partly on 8 supp. plates. With analyses and photomicrographs.

Compares Molding Sand Practice. P. G. H. Boswell. Foundry, vol. 47, no. 330, Sept. 1, 1919, pp. 592-595. Study made by English geologists and molding sand expert sent to America during war by Ministry of Munitions. Outstanding difference in practice on two sides of Atlantic is seen to hinge upon use of artificially bonded high-silica sands.

Semi-Steel

Semi-Steel and General Foundry Practice, David McLain. Can. Foundryman, vol. 10, no. 7, July 1919, pp. 180-183. Concerning possibilities of securing superior quality of gray iron, semi-steel or steel at reduced cost. Address delivered before Southern Metal Trades' Assn.

Silico-Manganese

Silico-Manganese for Steel Castings. E. F. Cone. Iron Age, vol. 104, no. 13, Sept. 25, 1919, pp. 855-857. Responses to circular addressed to foundries in which it was asked to state experience in use of one alloy instead of two.

FUELS AND FIRING

Air Furnace

Develop Firing System for Air Furnace, Milton W. Arrowood. Foundry, vol. 47, no. 16, Oct. 1, 1919, pp. 677-679, 2 figs. Burner designed to thoroughly mix powdered coal with air which burns it.

Bituminous Coal

Experiences in using Bituminous Coal as a Substitute for Anthracite, A. Bement. Heat. & Vent. Mag., vol. 16, no. 9, Sept. 1919, pp. 27-30, 1 fig. Changes made in firebox boilers said to have proved effective and suggestions for further improvements.

Brown Coal

Brown Coal as Boiler Fuel. Indus. Australian and Min. Standard, vol. 62, no. 1606, Aug. 21, 1919, pp. 347-349, 3 figs. Experiments conducted at Melbourne City Council's Power Station.

Coke and Coke Breeze

The Calorific Value of Commercial Coke and Coke Breeze. Kenneth Norton. Gas World, vol. 71, no. 1832, Aug. 30, 1919, p. 165, 1 fig. Suggested graphical method of determination.

Fuel Conservation

Methods for More Efficiently Utilizing Our Fuel Resources—XXX. Samuel S. Wyer. Gen. Elec. Rev., vol. 22, no. 10, Oct. 1919, pp. 760-766, 5 figs. Wastes involved in producing, transmitting and distributing natural gas are attributed to present low price of fuel. Conclusion is drawn that adequate conservation will be brought about only by raising price. Such a procedure, it is claimed, would render profitable expense that would have to be incurred by utility company to save its wastes and would induce consumer to use fuel efficiently.

Fuel Economy

Fuel Economy in Manufacturing Works. Charles F. Wade. Eng. & Indus Management, vol. 2, nos. 11 and 14, Sept. 11 and Oct. 2, 1919, pp. 330-333 and 426-429, 7 figs. Sept. 11: Equipment of boiler plant with a view to securing maximum economy. Oct. 2: Collection and tabulation of running data in connection with boiler plants.

Fuel Economy. Eng. & Indus. Management, vol. 2, no. 13, Sept. 25, 1919 pp. 390-394, 1 fig. Report of committee appointed by British Assn. for Investigation of Fuel Economy.

Fuel Oil

Fuel Oil—I, II, III, Charles W. Geiger. Power Plant Eng., vol. 23, nos. 19, 20 and 21, Oct. 1, 15 and Nov. 1, 1919, pp. 850-852, 908-914 and 958-961, 19 figs. Oct. 1: Present uses of California oil; gravity and heat value; advantages over coal as fuel. Oct. 15: Types of burners and settings: descriptions of plants Nov. 1: Records of use on Pacific coast steamships, with table showing saving of oil over coal.

Kiln

Notes on Forced Draft Firing in a Periodic Kiln, R. K. Hursh. Clay Worker, vol. 72, no. 4, Oct. 1919, pp. 322-324. Test carried out on round down-draft kiln, 26 ft. in diameter. Air was furnished at pressure of 1¼ to 1¾ in. water gage by a no. 30 Clarage fan.

Oil-Fuel Sprayer

Oil-Fuel Sprayer as Fitted in German Torpedo Boats. Trans. Inst. Mar. Engrs., vol. 31, no. 246, Sept. 1919, pp. 393-395, 1 fig. Parallel portion of needle is provided with three-start thread, 5/16-in. pitch, which gives whirling motion to oil and assures breaking up of particles for efficient combustion.

Pulverized Coal

The Use of Pulverized Coal, William H. Odell. Steam, vol. 23, no. 4, Oct. 1919, pp. 93-95, 3 figs. Description of Fuller Lehigh pulverized mill.

Firing Steam Boilers with Powdered Coal. Power House, vol. 12, no. 16, Oct. 6, 1919, pp. 446-447, 2 figs. Results of tests.

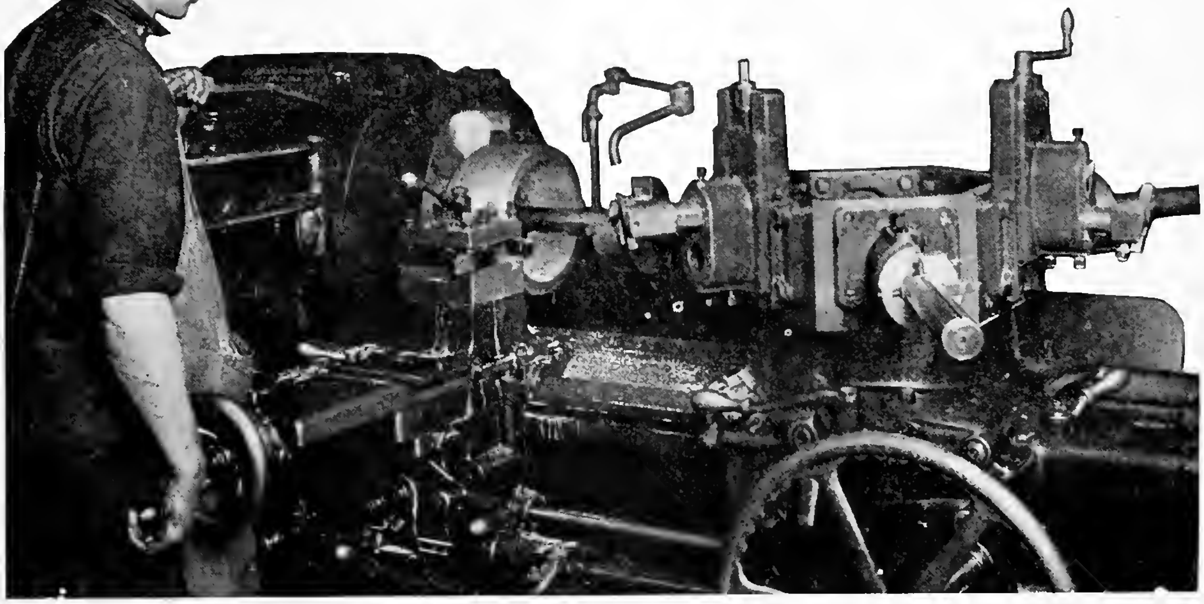
Apparatus for Burning Powdered Coal. Eng. & Indus. Management, vol. 2, no. 11, Sept. 11, 1919, pp. [illegible] fig. Describes Grindle system

ing rules of the different manufacturers' associations are given and the book closes with extensive statistics on the lumber produced and used in the United States.

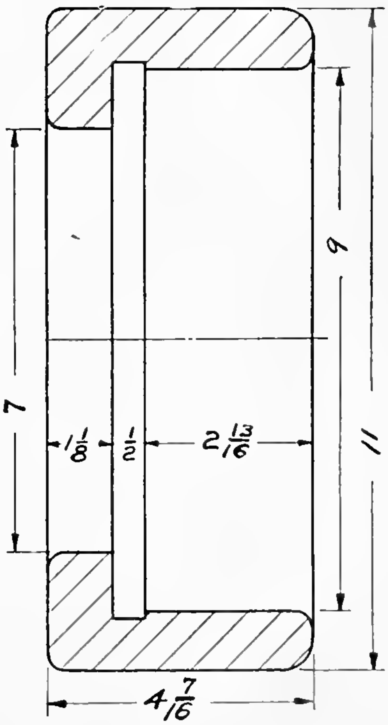
Waterproofing Engineering. For Engineers, Architects, Builders, Roofers, and Waterproofers. By Joseph Ross. First edition. John Wiley & Sons, Inc., 1919. Cloth, 6 x 9 in., 452 pp., 140 illus., 41 tables.

The absence of any systematic treatise on waterproofing has led

alone, nor by the laboring men alone, but that when these two classes are working together for a constructive purpose, they will find so many things in common that they will be more apt to forget their differences. Finally, he wishes to state once more this belief: That the real cause of the present-day unrest lies in the fact that there is no unit of measurement which both employers and employees can use; or, in other words, the fact that our present wage system is not based on knowledge and justice, but only on guesswork and on the fear that the one may "do" the other.



Breaks Another Time Record



The Hahn Manufacturing Company, a jobbing machine shop in Cleveland, reduced production time one-half on this drop forged Clutch Ring when the work was transferred from an engine lathe to a

No. 3-A Universal Hollow Hexagon Turret Lathe

Because of the flexibility of the tool equipment of the No. 3-A, the jobbing shop finds it adaptable for finishing small lots of different pieces as well as long runs of the same piece. Then the time saved by operating both square and hexagon turrets simultaneously, and the wide range of feeds and speeds for all classes of work makes the Universal Hollow Hex the machine for the jobber.

No. 4 Universal, 1½" x 10",	**16" Swing**
No. 2-A Universal, 2½" or 3¼" x 29",	**16½" Swing**
No. 3-A Universal, 3½" or 4½" x 44",	**21½" Swing**

THE WARNER & SWASEY COMPANY

Williams Machinery Co., Ltd., Toronto, St. John, Winnipeg and Vancouver. Williams & Wilson, Ltd., Montreal.

Mahr Calorizer and Furnace

Description of a Mahr Calorizer and Furnace J. H. Rodgers. Can Machy., vol. 22, no. 14, Oct. 2, 1919, pp 341-342, 8 figs. Description of oil-burning furnace for forging and heat-treating purposes.

GAGES

Optical Methods

Some Optical Aids for the Engineer—III. Arthur C. Banfield. Machy. (Lond.), vol. 14, no 363, Sept. 11, 1919, pp. 705-709, 15 figs. Description of method of projection gaging developed by Adam Hilger, Ltd, during the war, principally for accurate gaging of small totally reflecting prisms which form Porro erecting system of modern binocular.

Screw Threads

Effect of Angle Error in Connection with the Pitch-Engagement System of Grading Threads, W. G. Dunkley. Machy. (Lond.), vol. 14, no. 362, Sept. 4, 1919, pp. 683-685, 4 figs. Purpose of article is to examine more fully question of effect of angle error or tolerance. Following ways of specifying angle limits are discussed: (1) To fix ideal angle as minimum and to allow positive tolerance, (2) to fix ideal angle as maximum and allow negative tolerance, (3) to fix ideal angle as the mean and allow positive and negative tolerances.

The Pitch Engagement System of grading Screw Threads, W. G. Dunkley, Machy. (Lond.), vol. 15, no. 367, Oct. 9, 1919, pp. 57-58, 3 figs. Suggested methods for determining effective diameter angle of thread profile and pitch. System was described in Machy. (Lond.), vol. 14, p. 529.

GAS ENGINEERING

Gas Analysis

Application of the Interferometer to Gas Analysis, Junius David Edwards. Dept. Commerce, Technologic Papers of Bur. of Standards, no. 131 Oct. 6, 1919, 19 pp. Principle of gas interferometer and its methods of use in gas analysis is discussed in connection with calibration of instrument. Effect produced upon observations by variations in gas composition and experimental conditions is analyzed and equations developed by which magnitude of such changes can be estimated.

Gas Industry

Vital Issues Affecting the Gas Industry Today, John D. Kuster. Gas Age, vol. 44, no 8, Oct 15, 1919, pp. 339-343. Heat unit standard, municipal ownership and rate increases. Presidential address before Pacific Coast Gas Assn.

Interferometer

See Gas Analysis.

Low-Grade Gas

What is Low Grade Gas? Wm. Cranfield. Gas World vol. 71, no. 1833, Sept. 6, 1919, pp. 178-182 and 183-184. Study of subject by means of flames. Structure and aeration of flames; low-grade gas in use; addition of air; addition of blue water gas; addition of producer gas.

Ovens

Chamber-Type Ovens for Gas Works (Die Verwendung von Kammeröfen für Gaswerke), Heinrich Koppers. Journal für Gasbeleuchtung, vol. 62, nos. 29 and 30, July 19 and 26, 1919, pp. 399-405 and 420-421, 10 figs. Preparing coal for gasification. Operating results of horizontal ovens with regenerative heating.

Retort House

Easily effected Economies in the Retort House, Carl B. Wyckoff. Am. Gas Eng. Jl., vol. 111, no. 13, Sept 27, 1919, pp. 271-272 and 276-283, 9 figs. Furnace operation and design iron and brick work, scurfing retorts, stand pipes, bridge pipes, hydraulic main, drafts and other features are discussed.

Practical Hints on Retort House Operation, Carl B. Wyckoff. Gas Age, vol. 44, no. 8, Oct. 15, 1919, pp 345-350, 6 figs. Suggestions in regard to selecting type of grate and clinker doors, manner and frequency of scurfing, cleaning stand pipes and taking care of hydraulic main. (To be continued.)

Retorts

New Types of Retorts for Medium and Small Gas Works (Neue Ofensysteme für mittlere und kleinere Gaswerke), G. Aicher. Journal für Gasbeleuchtung, vol. 62, no. 29, July 19, 1919, pp. 397-398. Details of Munich type sloping-chamber retorts.

Study on Gas Retorts and Heat Economy (Wärmewirtschaftliche Betrachtungen über Gaserzeugungsöfen), Osw. Peischer. Journal für Gasbeleuchtung, vol. 62, no. 28, July 12, 1919, pp. 381-385, 2 figs. Operating data of recuperative retorts obtained in tests lasting one week.

Vertical Retorts Lend Themselves to Steaming with Better Results than in the Case of Horizontals, L. J. Willien, Jr. Am Gas Eng. Jl., vol. 111, no. 16, Oct. 18, 1919, pp. 367-371, 386 and 389. Because, it is noted, by introducing steam at bottom and allowing it to pass up through retorts highly heated upward current of blue water gas is established at beginning of carbonizing period, and this helps to dilute rich gases without absorption or loss of heat and with greatly accelerated rate of travel towards gas outlet. Paper read before Am. Gas Assn.

Separator, Centrifugal

New Centrifugal Gas Separator. Gas Jl., vol. 147, no. 2939, Sept. 9, 1919, pp 554-575, 3 figs. Separated impurities are said not to be thrown against fixed wall of casing, but to collect on inner surface of revolving drum from the wider edge of which they are thrown into liquor gutter.

Steaming Horizontals

Steaming Horizontals, R. J. Rew. Gas Jl., vol. 147, no. 2939, Sept. 9, 1919, pp. 557-559, 2 figs. Discussing advantages of short-period steaming; channel retorts; superheater difficulties; mixing of gas; loss in coke and wear and tear on retort.

Sulphur Removal

Removal of Sulphur from Illuminating Gas, W. W. Odell and W. A. Dunkley. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2301-2311. Because coals containing less than 1 per cent sulphur are becoming scarcer, it is pointed out that gas industry will be compelled to use coals that are now considered out of the question. Present processes of purification are outlined and discussed.

HANDLING OF MATERIALS

Army Supply Base

Boston Army Supply Base. Pac. Mar. Rev., vol 16, no. 10, Oct. 1919, pp. 110-113, 4 figs. Noting special freight-handling equipment.

Barge-Unloading Devices

Barge-Unloading Devices of Missouri Sand and Gravel Producers. Rock Products, vol. 22, no. 19, Sept. 13, 1919, pp. 24-26, 10 figs. Various types of derricks and travelers using clamshell buckets handle material from river barge to plant or stock pile.

Cement Materials

Conveying Raw Cement Materials, W. A. Scott. Cement, Mill & Quarry, vol. 15, no. 7, Oct. 5, 1919, pp. 11-13, 5 figs. Details of crushing and loading plant of International Portland and Cement Co. on Lake Pend Oreille, Northern Idaho.

Chemical Materials

Mechanical Handling of Chemical Materials, George Fred. Zimmer. Chem. Age, vol. 1, nos. 11 and 12, Aug. 30 and Sept. 6, 1919, pp. 294-296 and 322-323, 9 figs. With reference to nature of material and conditions to be met. The handling of coarse, crystalline or amorphous substances of fine dry powders, fine moist material, etc.

HEAT TREATING

Aluminum-Alloy Castings

Heat Treatment of Aluminum-alloy Castings, Zay Jeffries and W. A. Gibson. Bul. Am. Inst. Min & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp 2493-2512, 17 figs. Heat treatment of rolled and extruded aluminum alloy consists essentially in heating to temperature near 500 deg. cent. and quenching in water. It is suggested that non-uniform results obtained from heating aluminum-alloy castings in ordinary furnace atmosphere are due to porosity and oxidation of castings. Method designed to remedy these defects is proposed.

Case Hardening

Practical Talks on Casehardening; Why Failures Occur in Casehardening, T. G. Selleck. Jl. Am. Steel Treaters Soc., vol. 2, no. 1, Oct. 1919, pp. 40-47, 4 figs. Writer believes that the human element in carbonizing process "is responsible for all its failures."

Cast Steel

Heat Treatment of Cast Steel, John H. Hall, Arvid E. Nissen and Knox Taylor. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2881-2922, 104 figs. Results of experimental work conducted on steel made in 3-ton button-blown converter, most of steel analyzing about 0.05 in phosphorus and sulphur. Numerous photomicrographs of steel specimens are presented.

Copper-Oxide Annealing

Copper Diffuses Through Cast Iron, H. E. Diller. Foundry, vol. 47, no. 18, Nov. 1, 1919, pp. 779-780, 8 figs. Results of annealing experiments with copper oxide packing, in which graphite changed so that it appeared like temper carbon.

Gun Metal

Influence of Heat Treatment on Gun Metal, C. F. Smart. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919 pp. 1875-1881, 9 figs. Investigation undertaken to study effect of annealing followed by different rates of cooling and in particular effect of quenching. Specimens quenched in water from 650 deg., 705 deg., or 760 deg. fahr. were found lacking in strength and ductility.

Heat-Treating Furnaces

Heating Furnaces and Annealing Furnaces—IX, W. Trinks. Am. Drop Forger, vol. 5, no. 10, Oct. 1919, pp. 495-498, 6 figs. Features determining the fuel economy of continuous furnaces; rate of heat transmission; fuel economy for best working conditions and overall fuel economy, including mill delays.

See also Furnaces; Electrical Engineering, Furnaces (Heat Treating).

Malleable Iron

Experiments in Annealing Malleable Iron, H. E. Diller. Can. Foundryman, vol. 10, no. 7, July 1919, pp. 184-186, 4 figs. Results of tests are interpreted as having indicated that it is immaterial whether bars are cooled slowly or rapidly after they have reached 500 deg. cent.

Nichrome Castings

Nichrome Castings for Heat Treatment, Harrison Jenkns. Can. Foundryman, vol. 10, no. 10, Oct. 1919, pp. 299-300, 2 figs. Raw material, vol. 1, no. 7, Sept. 1919, pp. 341-342, 3 figs. Points of merit in properties of nichrome for use as material in heat-treating receptacles.

Pulverized Coal

Using Pulverized Coal for Annealing, Charles Longenecker. Foundry, vol. 47, no. 16, Oct. 1, 1919, pp. 680-681, 3 figs. Table showing typical run illustrates uniform temperature maintained with powdered coal.

Quenching Liquids

Cooling Properties of Technical Quenching Liquids, N. B. Pilling and T. D. Lynch. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2347-2367, 23 figs. Experiments made with cylinder, 50 mm. long, 6 mm. in diameter and made from nickel with 5 per cent silicon. Method used involved recording of fleeting temperatures within cylinder after being heated to fixed initial temperature and rapidly transferred to bath of quenching liquid. Quenching liquids used were water, brine, soap solution, three oils and sulphuric acid.

HEATING AND VENTILATION

Factory Buildings

The Ventilation of Factory Buildings. Eng. & Indus. Management, vol. 2, no. 15, Oct. 9, 1919, pp. 460-461, 2 figs. Importance of considering ventilation before designing factory.

The Ventilation of Industrial Establishments, Leonard Hill. Eng. & Indus. Management, vol. 2, no. 11, Sept. 11, 1919, pp. 326-328, 1 fig. Problem of ventilation is considered from three points of view: (1) cooling and evaporative powers of air (2) keeping of air free from noxious fumes or dust arising in process of manufacture, (3) spacing of workers. Author presents suggestions with a view to minimizing spread of infection among workers.

Heating Load Forecast

Forecasting Heating Loads, William B. Campbell. Heat & Vent. Mag., vol. 16, no. 10, Oct. 1919, pp. 19-22, 16 figs. From examination of curves representing annual range for "normal" outdoor temperature of locality as constructed from government records extending back for long periods.

Isolated Rooms

More Air for Offices and Drafting Rooms, Charles L. Hubbard. Factory, vol. 23, no. 5, Nov. 1919, pp. 1050-1052, 10 figs. Showing how ventilation in isolated rooms may be improved and draft prevented.

Nozzle Effect

See Ship Ventilation.

Remodeling Heating System

Remodeling a Heating System, Helen R. Louis. Heat & Vent. Mag., vol 16, no. 10, Oct. 1919, pp. 30-32, 1 fig. How piping connections were rearranged in building in order to secure greater economy and efficiency.

Ship Ventilation

Utilization of the Nozzle Effect for Ventilating Ships (Die Ausnutzung der Düsenwirkung für die Luftung auf Schiffen), Freudenthal. Schiffbau, vol. 20, no. 19, July 9, 1919, pp 518-522, 13 figs. Discussing older and more recent tests with water; utilization of nozzles for carrying off of water, steam and sounds. (To be concluded.)

Ventilating Equipment and Health

Ventilating Equipment Reduces Mortality during Winter, E. Vernon Hill. Domestic Eng., vol. 89, no. 4, Oct. 25, 1919, pp 167-168, 2 figs. Based on statistical figures of Octennial Report of Department of Health of City of Chicago.

HOISTING AND CONVEYING

Bucket Gear

A New Type of Enclosed Gear Bucket. Coal Trade Jl., vol. 50, no. 43, Oct. 22, 1919, pp. 1245-1246, 1 fig. Design in which all working parts are enclosed in tight casing, eliminating wear and facilitating lubrication.

Cranes

Overhead Electric Cranes in Steelworks, James Smith. Elecn., vol. 83, no. 2158, Sept. 26, 1919, pp. 355-362, 17 figs. Application in steel works of various types of overhead electric cranes such as traveling cranes, lifting magnets and charging machines.

Portable Floating Cranes of Huge Capacity. Commercial America, vol. 16, no. 3, Sept. 1919, pp. 43-49, 3 figs. Designed to lift 150 tons at radius of 105 ft. and at speed of 4 ft. per min. with vertical range from 25 ft. below to 95 ft. above level of water.

Protecting Mill Cranes from Overload, A. G. Place. Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, pp. 493-494. Recommends protection of individual circuits rather than main line. Paper read before Assn. of Iron & Steel Elec. Engrs.

Grain Elevators

The Palatine Patent Grain Elevator and Automatic Weighing Machine. Eng. & Indus. . no. 13, Sept. 25, 1919. It consists of hopper sup- ... mns from ordinary lorry ... ovided with two automatic ... suitable for filling sacks. buckets mounted on chains ... ets.

Heel Angles for Different Loads

Crane Lighter No. 4 Engineer, vol. 128, no. 3323, Sept. 5, 1919, pp. 225-226, 12 figs., partly on supp. plates. Diagrams showing angles of heel for various loads.

Winding Plant

Notes on the Overhead Koepe Winding Plant at Plenmeller Colliery, Haltwhistle, Northumberland, George Raw. Trans. North of England Inst. Min. & Mech. Engrs. vol. 68, no. 7, Aug. 1918, pp. 186-202 and (discussion) 202-204, 9 figs. Koepe hoist, applied first by Fr. Koepe in Westphalia, is described as winding counterpart of endless rope haulage in much the same way as drum winder is to main-and-tail rope haulage.

HYDRAULIC MACHINERY

Flow Measurement

The Orifice as a Means of Measuring Flow of Water through a Pipe, Raymond E. Davis and Harvey H. Jordan. Univ. of Illinois Bull., vol. 16, no. 14, Dec. 2, 1918, 56 pp., 14 figs. Results of tests made to determine practicability of using flow of water by means of thin-plate circular orifice inserted in pipe, to determine experimental coefficients for calculating flow in pipe and discharge, and to determine conditions most favorable to use of such an orifice as flow-measuring device.

Governors for Turbines

Seewer Universal Governor for High Pressure Hydraulic Turbines (Le régulateur universel système Seewer pour turbines hydrauliques à haute chute) A. Strickler. Bulletin Technique de la Suisse Romande, vol. 45, nos. 18, 19 and 20, Sept. 6, 20 and Oct. 4, 1919, pp. 181-184, 193-197 and 205-206, 11 figs. Sept 6: Mechanism connecting guiding plates with regulating rod. Sept. 20: Account of official tests at laboratory of Federal Polytechnic School at Zurich. Oct. 4: Operation of guide plates in controlling form of jet. (Concluded.)

Hydrodynamic Analogies

Hydrodynamic Analogies (Analogie Idrodinamiche), G. Spataro. Annali d'Ingegneria e d'Architettura, vol. 34, nos. 5 and 6, March 1 and 15, 1919, pp. 73-76 and 82-90. Generalization of law of reciprocity. Method is along lines followed by Lorentz in his demonstration of this law for viscous liquids.

INTERNAL-COMBUSTION ENGINES

Air Washers

Air Washers for Internal Combustion Motors (Ueber Luftfilter für Explosionsmotore), Thieme. Motorwagen, vol. 22, no. 15, May 31, 1919, pp. 268-270, 5 figs Radio air filter in air duct of older type of air suction.

Alcohol Engines

Alcohol Engines. Times Eng. Supp., vol. 15, no. 540, Oct. 1919, pp. 320, 1 fig. Tests and experiments on starting of internal combustion engines from cold made by Committee on Alcohol and Fuel appointed by Commonwealth of Australia Institute of Science and Industry.

Crossley Heavy-Oil Engine

Crossley Cold-Starting Heavy-Oil Engine. Engineer, vol. 128, no. 3324, Sept. 12, 1919, pp. 252-254, 5 figs. Combustion chamber is of spheroidal shape. This, it is said, gives least wall surface exposed to water jacket and permits of central core of air being heated by compression and cooled as little as possible by contact with walls.

Diesel Engines

Notes on Operation of Submarine Diesel Engines, Frederick C. Sherman. Jl. Am. Soc. Naval Engrs., vol. 31, no. 3, Aug. 1919, pp. 615-623. Notes taken by writer while operating under war conditions submarine Diesel engines of 440 hp., 4-cycle, 6-cylinder type installed on O-class of submarines.

Fuels

Power Characteristics of 20 Per Cent. Benzol Mixture, Jl. Soc. Automotive Engrs., vol. 5, no. 3 Sept. 1919, pp. 272-274, 4 figs. Based upon tests made in altitude laboratory of Bureau of Standards.

Governors for Gas Turbines

Governors for Constant-Pressure Internal-Combustion Turbines when using Turbo-Compressors (Beitrag zur Frage der Regulierung der Gleichdruck-Verbrennungsturbine bei Verwendung von Turbokompressoren), Adolf Borger. Zeitschrift für das gesamte Turbinenwesen, vol 16, no. 14, May 20, 1919, pp. 128-134, 11 figs. Comparison and practical application of governing methods in filling. Overload and mixture are also discussed. (Concluded.)

Horsepower Formula

A Practical Brake Horse Power Formula for Internal-Combustion Engines, Hermann Lemp. Gen. Elec. Rev., vol. 22, no. 10, Oct. 1919, pp. 808-809, 1 fig. Numerical coefficients of familiar formula for indicated horse power are combined into single round number 100,000,000.

Natural Gas

Natural Gas for Power, F. H. Bivens. Natural Gas & Gasoline Jl., vol 13, no. 10, Oct. 1919, pp. 352-354, 1 fig. How to equip an internal-combustion engine to use natural gas.

Supercharging

The Supercharging of Internal-Combustion Engines—I, Georges Funck. Automobile Engr., vol. 9, no. 131, Oct. 1919, pp. 318-322, 5 figs. Technical study of possibilities and limitations of forced induction.

Valves

High-Chromium Steel for Exhaust Valves. Jl. Soc. Automotive Engrs., vol. 5, no. 3, Sept. 1919, pp. 262-263, 2 figs. Properties and uses. From report of Sub-Division appointed at joint meeting of Iron and Steel Division of Soc. of Automotive Engrs. Standards Committee and Sub-Committee X, Committee A-1 of Am. Soc. for Testing Materials.

LUBRICATION

Oil Testing

Lubrication and Lubricating Oils, R. C. Demary. Power Plant Eng., vol. 23, no. 21, Nov. 1, 1919, pp. 955-958. Suggested tests for oils and summary of characteristics desirable for different purposes.

Power-Plant Management—II, Robert June. Refrig. World, vol 54, no. 10, Oct. 1919, pp. 25-26 and 30. Importance of viscosity tests as guide to lubrication.

Power-Plant Lubrication

Power-Plant Management—Lubrication, Robert June. Power House, vol. 12, no. 15, Sept. 20, 1919, pp. 411-413, 2 figs. Data relative to lubrication problems usually found in power plants.

Viscosity

See Oil Testing.

MACHINE ELEMENTS AND DESIGN

Crankshafts

Engine Crankshafts, Edward Ingham. Elec. Rev., Lond., vol. 85, no. 2182, Sept. 19, 1919, pp. 359-360. As principal causes of failure are stated: (1) unsuitable material; (2) restricted dimensions; (3) want of alignment; (4) fatigue; and (5) overloading.

Interchangeable Manufacture

Machine Design in Interchangeable Manufacturing Practice, Earle Buckingham. Machy. (Lond.), vol. 15, no. 366, Oct. 2, 1919, pp. 18-20. Considerations in regard to simplifying design to enable standard equipment to be used and factors governing choice of material.

Pulleys

Some Suggestions on Pulleys. Paper, vol. 25, no. 3, Sept. 24, 1919, pp. 15-18, 3 figs. States points that should be kept in mind when purchasing a pulley; strength, weight, coefficient of friction, balance, ease of mounting and durability.

Rings

The Bending of Thin Rings, John Prescott. Automobile Engr., vol. 9, no. 130, Sept. 1919, pp. 295-302, 13 figs. Investigation having special reference to behavior of piston rings under radial pressures.

Screws

The Strength of Screws, Bolts and Nuts, C. E. Stromeyer. Can. Machy., vol. 22, no. 13, Sept. 25, 1919, pp. 320-321. Data regarding items of mechanical design as stated in author's memorandum to Manchester Steam Users' Assn.

Springs

Laminated Springs—I, T. H. Sanders. Automobile Engr., vol. 9, no. 131, Oct. 1919, pp. 333-341, 20 figs. Theoretical characteristics of design.

Parallel Helical Springs, R. J. Cousins. Automobile Engr., vol. 9, no. 130, Sept. 1919, pp. 302-304, 4 figs. Method for quickly determining their approximate dimensions.

Williams Internal Gearing

Design and Calculation of Williams Internal Gearing, Reginald Trautschold. Machy. (N. Y.), vol. 26, no. 2, Oct. 1919, pp. 110-115, 5 figs. In Williams system, profiles of internal gear teeth are straight lines so that tooth spaces are similar to those of involute rack, while teeth of mating pinion have curved profiles of conjugate form.

MACHINE SHOP

Automatic Machines

Production Milling on Automatic Machines, Edward K. Hammond. Machy. (N. Y.), vol. 26, no. 2, Oct 1919, pp. 150-154, 11 figs. Also Machy. (Lond.), vol. 14, no. 364, Sept. 18, 1919, pp. 741-748, 14 figs. Machines built by Pratt & Whitney Co., Hartford, Conn. These millers have been evolved from Lincoln type and are equipped with intermittent table feed and fast traversing mechanism, and automatic quick return for table. Practice in milling of duplicate parts. Second of two articles.

Belt Adjustments

Unusual Adjustments of Belts, Pulleys and Shafting, H. C. Shields, Jr. Belting, vol. 15, no. 6, Sept. 20, 1919, pp. 24-25, 8 figs. General suggestions for superintendent and shop foreman.

Conveyors for Jigs

How Two Conveyors keep Jigs in Use, P. F. O'Shea. Factory, vol. 23, no. 5, Nov. 1919, p. 1045. Instead of waiting for jigs to pile up and then returning them in a bunch, this conveyor is said to return them to start of process so that they get back into use quickly.

Cutters, Milling

The Fastening of Milling Cutters, Joseph Horner. Machy. (Lond.), vol. 14, no. 363, Sept. 11, 1919, pp. 710-713, 46 figs. Showing methods used for driving cutters, forms of end mill fittings, methods for securing arbors, and examples of collet chucks.

Gear Cutting

Tooth Gear Cutting, W. Duckett. Machy. Market, no. 986 and 987, Sept. 26 and Oct. 3, 1919, pp. 21-22 and 23-24, 6 figs. Review of methods and machines. Sunderland gear cutter and Fellows gear shaper. Paper read before Coventry Eng. Soc.

Jigs

A Discussion of the Various Types of Jigs, Robert Mawson. Can. Machy., vol. 21, nos. 15 and 17, Oct. 16 and 23, 1919, pp. 387-390 and 407-410, 22 figs. Noting specially variations of fundamental principle involved in order to suit various requirements. Article is illustrated by reference to shop practice. Open type location jigs and holding jigs.

Metal-Cutting Tools

Relation of Heat Treatment, Design and Selection of Steels for Metal Cutting Tools to Factory Production, C. P. Berg. Jl. Am. Steel Treaters Soc., vol. 2, no. 1, Oct. 1919, pp. 7-11. Writer observes that it is first necessary to have proper kind of metal and tool, and secondly, to know how to use it in order to obtain maximum production in a factory. As there is no proper kind of cutting tool unless it is properly heat-treated, he concludes: "It appears that development of proper heat-treating process is most important for securing successful production."

Models

Purpose of Models in Interchangeable Manufacturing. Earle Buckingham. Machy. (N. Y.), vol. 26, no. 2, Oct. 1919, pp. 129-130. Also Machy. (Lond.), vol. 15, no. 367, Oct. 9, 1919, pp. 59-60. Points out relative value of models in constructive development of new article which is to be made in large quantities by interchangeable methods.

Pump Repairs

Repairing a Large Centrifugal Pump, J. H. Rodgers. Can. Machy., vol. 22, no. 13, Sept. 25, 1919, pp. 322-323, 2 figs. Completed work said to have meant a saving in time of several weeks and nearly $2,500 to contractor.

Taylor Methods

Supplement to Frederick W. Taylor's "On the Art of Cutting Metals"—II, Carl G. Barth. Indus. Management, vol. 58, no. 4, Oct. 1919, pp. 282-287, 5 figs. How principles and experimental results of cutting metals are applied in machine-shop practice.

Turret-Lathe Practice

Turret-Lathe Practice, Erik Oberg. Machy. (N. Y.), vol. 26, no. 2, Oct. 1919, pp. 99-109, 31 figs. Examples of turret lathe practice based upon experience and practice of Service Dept. of Gisholt Machine Co., Madison, Wis.

MACHINERY, METAL-WORKING

British Shops

The Works and Products of Messrs. Barr and Stroud, Limited. Engineering, vol. 108, no. 2800, Aug. 29, 1919, pp. 263-266 and 278, 11 figs, partly on two supp. plates. Details of machine shops, with reference specially to automatic and gear-cutting machines.

Chucks

Collet Chucks—X, Fred Horner. Mech. World, vol 66, no. 1708, Sept. 26, 1919, pp. 146-147, 4 figs. Example of chuck which incorporates geared lever action in combination with cam ring and ball closing. (Concluded.)

Cutters, Milling

Inserted Tooth Milling Cutters. Machy. (Lond.), vol. 14, no. 364, Sept. 18, 1919, pp. 753-754, 5 figs. Tables showing proportions of various types of cutters.

Lathes

A New Form of Lathe and Some of Its Products. Automotive Industries, vol. 41, no. 13, Sept. 25, 1919, pp. 624-626, 9 figs. Description of a machine which is said to simplify multi-tool operations in several ways.

Notes on Capstan and Turret Lathes—IV, Joseph Horner. Mech. World, vol. 66, no. 1709, Oct. 3, 1919, pp. 158-159, 3 figs. Types of vertical-axis and inclined-axis designs.

Machine-Tool Developments

Recent Machine-Tool Developments—IV and V, Joseph Horner. Engineering, vol. 108, no. 2800 and 2802, Aug. 29 and Sept. 12, 1919, pp. 266-271 and 330-332, 37 figs. Drilling machine framings: pillar machines. Beds, ways and reciprocating slides, planers, shaping, machine framing and milling machines.

Milling Machines

The Ingersoll Differential Type Continuous Milling Machine, J. V. Hunter. Am. Mach., vol. 51, no. 14, Oct. 2, 1919, pp. 645-650, 6 figs. It consists of two main parts, namely, work-carrying table and head-carrying milling-cutter spindles, each of which may be arranged for simultaneous operation on different pieces of work.

Planer, Bevel-Gear

Sunderland 24-inch Bevel Gear Planer. Machy. (Lond.), vol. 15, no. 367, Oct. 9, 1919, pp. 40-42, 6 figs. Machine is based on principle that bevel gear teeth require to be planed along lines which meet at apex of cone, cross-section of teeth being in proportion to their distance from apex.

Thread-Milling Machines

British Thread-Milling Machines—I and II. Engineer, vol. 128, no. 3324 and 3325, Sept. 12 and 19, 1919, pp. 249-252 and 274-277, 15 figs. Machine built by Charles Taylor, Ltd., Birmingham. Both headstocks are adjustable on slots within base plate, work headstock longitudinally and cutter headstock transversely. Machine is capable of cutting either internal or external, right-hand or left-hand threads.

MACHINERY, SPECIAL

Cylinder Boring and Reaming Fixtures

Cylinder Boring and Reaming Fixtures. Machy. (Lond.), vol. 14, no. 362, Sept. 4, 1919, pp. 680-683, 11 figs. Different designs of fixtures for locating and holding automobile engine cylinder castings during boring and reaming operations.

Dredge, Hydraulic

Features of Electrically Operated Hydraulic Dredge, Charles W. Geiger. Cement, Mill & Quarry, vol. 15, no. 6, Sept. 20, 1919, pp. 35-37, 5 figs. Description of dredge owned and operated by City of Oakland, Cal.; advantages of electric drive and savings effected. Central-station service is used.

Excavating Machinery

British Excavating Machinery, A. E. Collins. Eng. & Contracting, vol. 52, no. 18, Oct. 29, 1919, pp. 492-493, 3 figs. Blondin machine which consists of steel wire main cable suspended between two towers; on main cable runs load-carriage supporting hoisting block. From Water & Water Eng., Lond.

Steam Pile Hammers

Steam Pile Hammers. Bulletin of Gen. Contractors Assn., vol. 10, no. 8, Aug. 1919, pp. 159-161, 3 figs. Uses of various types.

Tin-Plate Machine

Invent Novel Tin-Plate Machine. Iron Trade Rev., vol. 65, no. 16, Oct. 16, 1919, pp. 1054-1055, 2 figs. Four plates handled simultaneously in unusual type of machine in Welsh mill which automatically feeds, pickles, tins and cleans plates at rate of 125 boxes in 24 hr.

MACHINERY, WOODWORKING

Sawing Machine

Rapid Vertical Sawing Machine. Engineering, vol. 108, no. 2801, Sept. 5, 1919, pp. 308-309, 8 figs. Hack-sawing machine capable of cutting through bar 9 in. in diameter and of beveling 12-inch girder at any angle, and also suitable for cutting out forks of connecting rod forgings.

MATERIALS OF CONSTRUCTION AND TESTING OF MATERIALS

Bearing Metals

Observations on a Typical Bearing Metal, Hilda E. Fry and W. Rosenhain. Automobile Engr., vol. 9, no. 131, Oct. 1919, pp. 323-325, 14 figs. Microscopic examinations and Brinell measurements of alloy consisting of 4 per cent copper, 9 per cent antimony and 87 per cent tin. Paper presented before Inst. of Metals.

Bronzes, Lead-Zinc

Physical Properties of Certain Lead-Zinc Bronzes, Homer F. Staley and C. P. Karr. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2513-2522, 5 figs. Of nine variations in composition of lead-zinc bronzes containing 90 per cent copper studied, the one found to be most satisfactory contained 90 per cent copper, 6.5 per cent tin, 0.5 per cent lead, and 3 per cent zinc. This composition showed proportional limit of 12,200 ± 650 lb. per sq. in., tensile strength 40,700 ± 1500 lb. per sq. in., elongation in 2 in. of 37.6 ± 6.4 per cent, and reduction in area of 34.1 ± 4.5 per cent.

Chrome-Nickel Steels

See Nickel-Chrome Steels.

Constantan

Manufacture and Electrical Properties of Constantan, F. E. Bash. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2409-2430, 12 figs. Experiment work conducted by International Nickel Co. in co-operation with Electrical Alloys Co. for the purpose of developing constantan that would give e.m.f. of 47.40 millivolts against pure iron at 1500 deg. fahr.

Insulators, Heat

The Thermal Conductivities of Insulators in Relation to the Lagging of Steam Pipes, R. Thomas. Chem. Indus., vol. 38, no. 19, Oct. 15, 1919, pp. 357t-360t, 5 figs. Results of experiments are tabulated and curves are given showing effect of thickness of insulator on heat lost.

Leather Substitutes

Leather Substitute Products and Markets. Raw Material, vol. 1, no. 7, Sept. 1919, pp. 322-327, 7 figs. $50,000,000 worth of leather substitutes said to be produced and consumed annually in the U. S. A.

Malleable-Iron Machinability

Machining Qualities of Malleable, Edwin K. Smith and Wm. Barr. Foundry, vol. 47, no. 16, Oct. 1, 1919, pp. 682-684, 2 figs. Cutting and drilling tests made on malleable iron samples with different physical properties to determine relation of high elongation and tensile strength to machinability of metal.

Nickel

Physical Properties of Nickel, David H. Browne and John F. Thompson. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2693-2720. Synopsis of information found in textbooks and reports of various investigators, compiled for use by practical men.

Nickel-Chrome Steel

Temper-Brittleness of Nickel-Chrome Steel, R. H. Greaves. Iron and Steel Inst., meeting of Sept. 1919, paper no. 7, 20 pp., 7 figs. By "temper-brittleness" is meant condition induced in nickel-chrome steel by slow cooling from tempering temperature, and revealed by low absorption of energy in single blow impact test on notched bars. With a view to promote discussion on subject, writer presents results of experiments which he performed to determine effect of slow cooling after tempering on impact figure of these steels.

Brittleness in Nickel-Chrome and Other Steels, F. Rogers. Iron and Steel Inst., meeting of Sept. 1919, paper no. 11, 4 pp. Tests to examine possibility of discriminating as to toughness or brittleness without destroying article.

Fatigue Tests of Nickel and Chrome-Nickel Steel. Eng. World, vol. 15, no. 8, Oct. 15, 1919, pp. 31-34, 4 figs. It is concluded that static elastic strength is not reliable index of fatigue resisting strength under repeated stress, and that perfection of surface finish is appreciable factor in developing resistance to fatigue under repeated stress. Paper presented before Am. Soc. for Testing Materials.

Notched-Bar Tests

Notched Bar Tests, W. C. Unwin. Engineering, vol. 108, no. 2802, Sept. 12, 1919, pp. 329-330. Suggestions in regard to establishing empirical formula for reduction.

Rolling of Steel and Mechanical Properties

Influence of Rolling on Mechanical Properties of Steel (Observations sur le corroyage de l'acier), Ch. Fremont. Génie Civil, vol. 75, no. 1936, Sept. 20, 1919, pp. 274-276, 6 figs. Experiments similar to those described by Georges Charpy (see C. R. July 1, 1918, and Revue de Metallurgie, Sept.-Oct. 1918) are reported and it is claimed that longitudinal deformations obtained did not have undulations described by M. Charpy.

Steel, Physical Tests

Practical Notes on Physical Tests of Steel—II, Austin B. Wilson. Am. Drop Forger, vol. 5, no. 10, Oct. 1919, pp. 499-501, 3 figs. Also Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, pp. 500-502, 3 figs. Discussion of hardness test; sclerometric methods; Brinell tests; Shore scleroscope; Fremont, Charpy and Izod dynamic tests; practical notes for conducting tests to secure accurate results.

Steel, Testing by Magnetic Analysis

Testing Steel by Magnetic Analysis, R. L. Sanford. Iron Trade Rev., vol. 65, no. 18, Oct. 30, 1919, pp. 1181-1183, 10 figs. Apparatus used and results obtained. Paper presented before Am. Iron & Steel Inst.

Stellite

Stellite, the New Cobalt Alloy, Thomas Southworth. Can. Chemical Jl., vol. 2, nos. 2 and 3, Feb. and March 1918, pp. 38-39 and 57-58. Made of cobalt and chromium. It is said to resist oxidation or tarnishing better than any metal excepting gold and metals of platinum groups, specially when chromium content is over 15 per cent.

Stress Lines in Steel

Stress Lines in Steel after Permanent Deformation, Andrew McCance. Sci. Am. Supp., vol. 88, no. 2282, Sept. 27, 1919, pp. 196-197, 15 figs. Study of hardening at various distances from the point altered by hammering, punching or shearing. From Trans. Instn Engrs. & Shipbuilders, Scotland.

Tubing

Manufacture and Properties of Light-Wall Structural Tubing, H. J. French. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1855-1874, 4 figs. Including tables showing physical properties of low-carbon seamless tubes, effect of varying cold reduction in outside diameter on seamless steel tubing, effect of low-temperature annealing on properties of low-carbon cold drawn seamless steel tubes, effect of furnace temperature variation in final annealing on properties on low-carbon seamless steel tubing, and properties of hard-drawn and partly annealed 0.3 to 0.4 per cent carbon seamless steel tubes and of cold-drawn 3½ per cent nickel-steel seamless tubing under varying thermal treatment.

Tungsten Steel

On some physical Constants of Tungsten Steels, Kotaro Honda and Tokujiro Matsushita. Sci. Reports of Tohoku Imperial University, vol. 8, no. 2, Aug. 1919, pp. 89-98, 7 figs. Experiments with specimens containing different percentages of tungsten, contents of carbon being 0.3 per cent in one series and 0.6 per cent in another.

Work, Effect on Metals

The Effect of Work on Metals and Alloys, Owen Wm. Ellis. Engineering, vol. 108, no. 2800, Aug. 29, 1919, pp. 290-292, 13 figs. Results of research work of investigators into effect of cold work on mechanical properties of metals and alloys are collated, and evidences are noted of existence of points of inversion in graphs connecting percentage reduction by work and mechanical properties of certain metals and alloys, for example, steel, brass, copper, etc. Hypothesis that for every temperature there exists a critical range of deformation at which recrystallization of amorphous material accruing as result of cold work is extremely rapid is discussed. Paper read before Inst. of Metals.

MEASUREMENTS AND MEASURING APPARATUS

Angle Measurement

Some New Johansson Measuring Appliances. Automotive Industries, vol. 41, no. 13, Sept. 25, 1919, pp. 611-612, 3 figs. One of the sets is said to be for the measurement of angles to a degree never before attempted.

Comparator, Wilson Projection

Some Optical Aids for the Engineer—IV, Arthur C. Banfield. Machy. (Lond.), vol. 14, no. 364, Sept. 18, 1919, pp. 737-740, 10 figs. Description of Wilson projection comparator. Operator avoids distortion by special twin optical system of such a nature that respective optical centers are adjustable to diameter of screw under test.

Johansson Apparatus

See Angle Measurement.

Meters, Venturi

Computation of the Coefficient of Discharge of Venturi Meters, W. S. Pardoe. Eng. News-Rec., vol. 83, no. 13, Sept. 25, 1919, pp. 606-608, 6 figs. Tests at University of Pa. said to have indicated that coefficients may be computed within 0.5 per cent of experimental values.

Pyrometers

Pyrometer Protection Tubes, Otis Hutchins. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1811-1816, 3 figs. Experiments to determine effectiveness of protection appliances used for high-temperature pyrometer insulations involving use of platinum couples, and outline of characteristics of carborundum protection tube.

Self-checking Galvanometer Pyrometer, H. F. Porter. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1803-1805, 2 figs. Galvanometer circuit so arranged that by means of simple adjustment resistance of entire circuit is rendered equal to constant predetermined value, as substitute of continuously deflecting pyrovolter.

Resistance Thermometry, F. W. Robinson. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1829-1836, 1 fig. Advantages of electric resistance method, its limitations; construction and protection of resistance spirals; types of measuring apparatus; and table giving resistance values for quartz-resistance thermometers.

Alloys Suitable for Thermocouples and Base-metal Thermoelectric Practice, J. M. Lohr. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1837-1843, 2 figs. Development of "chromel" and "alumel." Also notes on methods of controlling temperature at cold end and diagrams for installing thermocouple extensions.

Application of Pyrometry to Problems of Lamp Design and Performance, I. H. Van Horn. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2271-2300, 7 figs. In studying temperature description in vacuum lamp and in gas-filled lamp, gas loss for coil filament in gas-filled lamp, and measuring filament temperature.

Report of Pyrometer Committee of National Research Council, George K. Burgess. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2271-2300, 7 figs. Committee was formed Sept. 20, 1919, for purpose of developing pyrometric method suitable for open-hearth steel practice so that effects of temperature in various stages of process of steel making might be correlated quantitatively with other factors influencing production of sound steel. It is reported that use of Acheson graphite, either in block or tube form, as target after immersion to desired depth and location in metal bath and sighted upon by optical pyrometer, was found in experiments to be serviceable method of temperature control.

Recent Improvements in Pyrometry, R. P. Brown. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1979-1994, 5 figs. Improvements in applications of pyrometers to industry. Writer observes that while certain foreign countries were formally recognized as leaders in manufacture of scientific instruments and particularly pyrometers, this lead has now been taken by United States.

Automatic Compensation for Cold-Junction Temperatures of Thermocouple Pyrometers, Felix Wunsch. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2065-2071, 7 figs. Illustrating various systems of automatic compensation, notably by carbon discs, by nickel and manganin coils and method used in Leeds and Northrup split-circuit potentiometer system.

Teaching Pyrometry in Our Technical Schools, George V. Wendell. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2097-2106. Mere acquaintance with constructional details of pyrometers and their operations is not considered sufficient for intelligent application of pyrometers to scientific and industrial measurement of temperature. It is suggested that a course in pyrometry should rather lay such a sound foundation that any subsequent heat problem can be attacked with confidence and good judgment.

The "Wedge" optical Pyrometer. Engineer, vol. 128, no. 3323, Sept. 5, 1919, pp. 229-230, 3 figs. Instrument consists of rectangular brass tube across which, at right angles, there is fitted a small telescope.

Tables and Curves for Use in Measuring Temperatures with Thermocouples, Leason H. Adams. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2111-2124, 6 figs. Calibration tables covering range zero to 1755 deg. cent. for platinum, platinrhodium couple, zero to 385 deg. cent. for copper-constantan and zero to 1283 deg. cent. for chromel-alumel. Curves show variation of thermoelectromotive force with temperature, sensitivity of couples at various temperatures and similar characteristics.

Fundamental Laws of Pyrometry, C. E. Mendenhall. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2111-2124, 6 figs. Survey of physical basis of pyrometry.

Application of Pyrometry to the Manufacture of Gas-mask Carbon, Kirtland Marsh. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1611-1626, 7 figs. Pyrometry equipment at works of Astoria Light, Heat & Power Co., Astoria, N. Y., where gas-mask carbon was produced from cocoanut shells and fruit pits.

Recording Pyrometry, C. O. Fairchild and Paul D. Foote. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1627-1654, 22 figs. Pyrometers that can be made to record automatically are classified under (1) gas saturated vapor, and liquid thermometers, (2) resistance thermometers, (3) thermoelectric pyrometers, and (4) radiation pyrometers. Of these, thermoelectric pyrometers have greatest applicability. Various types of thermocouple recorders, some operating on galvanometric principle and some on potentiometric system, are described.

Recording Thermocouple Pyrometers, Leo Behr. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1655-1660, 5 figs. Device consisting of Wheatstone bridge network in series with thermocouple, one arm of bridge being of nickel and being located at cold end of thermocouple, described as permitting accurate automatic cold-junction compensation.

Pyrometry in Rotary Portland Cement Kilns, Leo I. Dana and C. O. Fairchild. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1661-1673, 1 fig. Measurements of temperatures in dry-process, coal-burning kiln, made by High-temperature Measurements Section of Bur. of Standards.

Some Factors Affecting the Usefulness of Base-Metal Thermocouples, O. L. Kowalke. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1751-1761, 7 figs. Factors considered are indicating and recording instruments, insulation on elements, constancy and homogeneity of wires and resistance to oxidation in furnace.

Potentiometers for Thermoelement Work, Walter P. White. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1763-1772, 3 figs. Methods of reading thermocouple pyrometers, specially by potentiometers and by intermediate instruments, such as pyrovolter.

Theory and Accuracy in Optical Pyrometry with Particular Reference to the Disappearing-Filament Type, W. E. Forsythe. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2547-2578, 10 figs. Including tables giving results obtained by experience of observers using different red glasses and different absorbing glasses, and also results of intercomparison temperature scales.

Thermoelectric Pyrometry, Paul D. Foote, T. R. Harrison and C. O. Fairchild. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2631-2686, 35 figs. Analytical presentation of physical phenomena underlying operation of indicating instruments, outline of their commercial forms, discussion of correction for irreproducibility of couples and comparative study of protection tubes for thermocouples.

Pyrometry in the Tool-manufacturing Industry, J. V. Emmons. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2155-2158. Suggests establishing regular system of inspection and testing to safeguard unsatisfactory service from all types and makes of pyrometers.

Protecting Tubes for Thermocouples, R. B. Lincoln. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2147-2150. Care taken in selection of proper tubes, locating it in most favorable place in furnace, and then inspecting and replacing it before it has deteriorated enough to injure couple, are suggested as means of increasing accuracy and decreasing up-keep charges.

A Reference Standard for Base-Metal Thermocouples, N. E. Boon. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2135-2137. It is concluded from investigation undertaken to determine third metal against which iron and constantan might be checked, that copper is ideal standard for checking of base-metal thermoelements, because it can be easily obtained in electrolytic form, in which it has same thermoelectric properties regardless of its origin.

Shadow Measurement

New Method of Measuring Shadows (Ein neuer Weg zur Messung von Schatten), Konrad Norden. Journal für Gasbeleuchtung, vol. 62, no. 30, July 26, 1919, pp. 416-420, 3 figs. Calculation and valuation of shadows in lighting installations.

Scale Testing

The Personal Equation in Testing Scales. Scale Jl., vol. 6, no. 1, Oct. 10, 1919, p. 7, 2 figs. Diagrams indicating how a person can be influenced by convenience and prejudice in coming to a decision while making measurements or carrying out tests.

Temperature Control

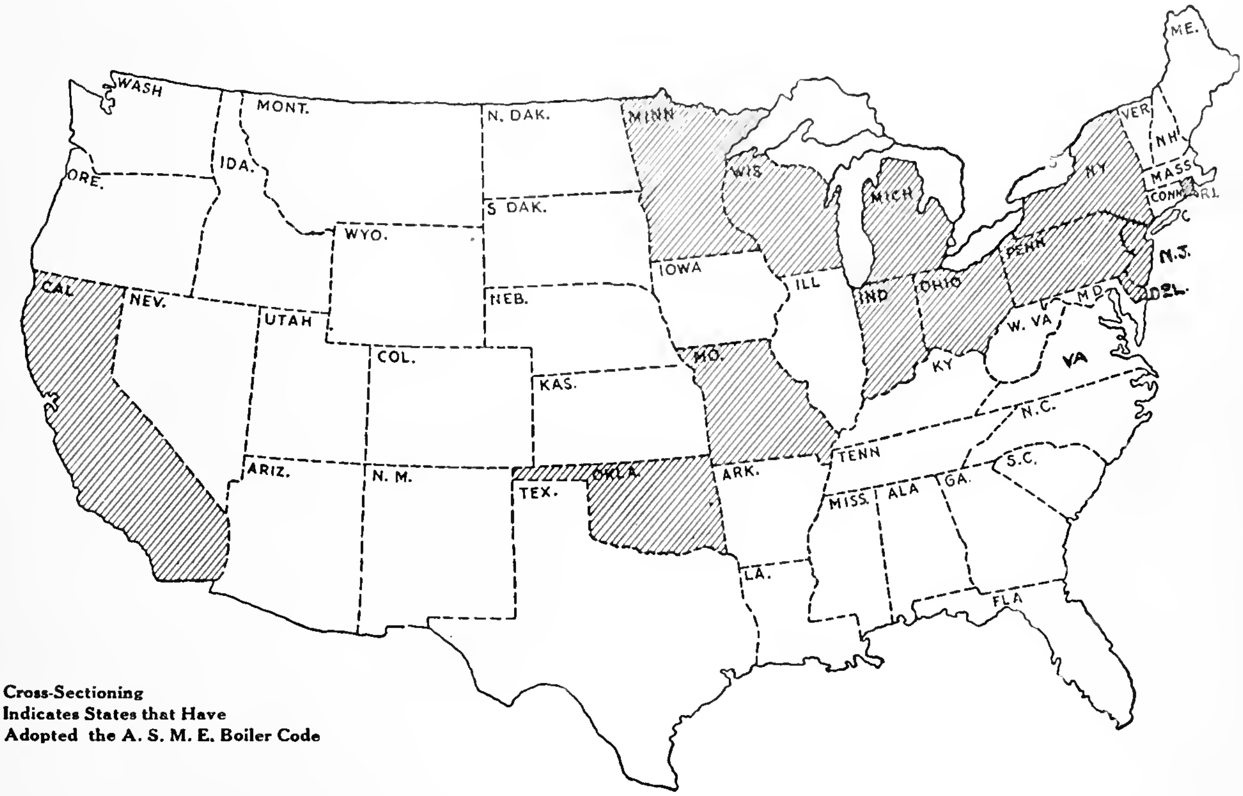
High-Temperature Control, C. O. Fairchild and Paul D. Foote. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1701-1715, 9 figs. Relation of temperature variations to other factors involved in control of furnace, kilns, ovens, tanks, etc., operated at high temperatures is discussed and brief description given of devices used in high-temperature control.

Temperature Measurements

Temperature Measurements of Incandescent Gas Mantles, Herbert E. Ives. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1681-1686, 3 figs. Comparative study of measurements effected by three methods—optical, total radiation, and by thermocouples. Of these, the last method was found to be most accurate.

See also Pyrometry.

HEINE BOILERS
are
"CODE BOILERS"



Cross-Sectioning Indicates States that Have Adopted the A. S. M. E. Boiler Code

We are and will continue to be staunch supporters of the A. S. M. E. Boiler Code or any other code that specifies quality and honesty.

From the very first we were closely identified with the development of this excellent code. In fact, Col. E. D. Meier, our first president, was in a measure the originator of this code because while serving as President of the A. S. M. E. he appointed the first boiler code committee.

The work of that committee and of subsequent committees has resulted in the code as it now stands. We take much pride in the prominent rôle of our first president in placing steam boiler design upon a firm and safe foundation.

So, regardless of the state or country in which Heine Boilers are sold, they will all pass the rigid requirements of the A. S. M. E. Code. We believe in the Code to that extent.

The Heine Boiler is fully illustrated ard described in our treatise "Boiler Logic."

HEINE SAFETY BOILER CO.

5321 Marcus Avenue, St. Louis, Mo.

Temperature Scale

Standard Scale of Temperature, C. W. Waidner, E. F. Mueller and Paul D. Foote. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2051-2063. Outline of proposed international scale of temperatures in interval from — 40 per cent to 1100 per cent; also account of work done and data obtained to devise uniform scale above 1100 per cent.

High-Temperature Scale and Its Application in the Measurement of True, Brightness, and Color Temperatures, Edward P. Hyde. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1969-1974. Discussion of Boltzman's and of Planck's equations.

Thermometers

High-temperature Thermometers, R. M. Wilhelm. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1687-1700, 5 figs. Industrial forms of high temperature mercurial thermometers and indicating and recording thermometers of vapor-pressure, liquid or gas-filled, and bimetallic or graphite-metal expansion tubes.

Vacuum Gage

A Simple Theory of the Knudsen Vacuum Gauge, George W. Todd. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 225, Sept. 1919, pp. 381-382. Expression of pressure in terms of constants of instruments.

Vapor-Pressure Estimation

Improved Apparatus for the Estimation of Vapor Pressures, Allan Morton. Chem. Indus., vol. 38, no. 19, Oct. 15, 1919, pp. 363t-364t, 1 fig. Apparatus in which taps of ordinary type have been eliminated.

MECHANICS

Balancing of Rotating Parts

Dynamic Balancing of Quickly rotating Machine Parts (Ueber die dynamische Auswuchtung von rasch umlaufenden Maschinenteilen), Hans Heyman. Elektrotechnische Zeitschrift, vol. 40, nos. 21, 22 and 23, May 22 and 29, and June 5, 1919, pp. 234-237, 251-254 and 263-265, 59 figs. Discussing Norton, Akimoff and Heyman methods. Progressive balancing method of writer was illustrated on a machine built by Schenk, Darmstadt, built in six sizes, making as high as 20,000 r.p.m., at which figure recording takes place by means of optical mirror apparatus. (Concluded.) Paper read before Elektratechnischer Verein, Berlin.

Beams

New Formulæ for the Economical Design of Rectangular Beams Particularly as Regards Shear Resistance, John C. Gammon. Indian Eng., vol. 66, no. 10, Sept. 6, 1919, pp. 137-138. Condition for no-shear reinforcement in a slab.

Determination of Secondary Stresses in Level Truss Constructions with Rigid Joints (Zeichnerisches Verfahren zur Ermittlung der Nebenspannungen des ebenen steifknotigen Fachwerkes), Chr. Vlachos. Eisenbau, vol. 10, no. 1, Jan. 1919, pp. 2-10, 11 figs. Discussing elastic funicular polygons of continuous beams, determination of change of angles and moment of support. Curves and formulæ.

Contribution to the Study of the Vierendeel Beam (Contribution à l'étude de la poutre Vierendeel), F. Keelhoff. Annales de l'Association des Ingénieurs de Gand, vol. 7, no. 5, 1914, pp. 431-448. Determining lines of influence by means of Maxwell theorem relative to reciprocity of deformations.

Engine Columns

The Design of Engine Columns—IV, W. K. Wilson. Mech. World, vol. 66, no. 1708, Sept. 26, 1919, p. 150, 2 figs. Method of stiffening columns by webplates. (Concluded.)

Mechanisms

The Design of Small Machinery, W. E. Thompson. Machy. (Lond.), Oct. 16, 1919, pp. 76-80, 7 figs. Qualifications necessary for single purpose machines, with notes on selection of bearing materials. Details of such mechanisms as hoppers for screw-slot machines and some special machines are taken up.

Motion

A Time-Scale independent of Space Measurement. Parabolic and Hyperbolic Kinematics, L. Silberstein. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 225, Sept. 1919, pp. 382-394, 3 figs. Based principally on assumption that among all possible motions leading from one world point to another there is one and only one uniform motion.

Resistance of Materials

Application of Principle of Mechanical Similitude to Structures (Applicazioni del principio di similitudine meccanica alle costruzioni). Annali d'Ingegneria e d'Architettura, vol. 34, no. 15, Aug. 1919, pp. 228-235. Formula and calculations for determining resistance of material.

Shafts, Critical Speed

Critical Speeds of Torsion Shafts (Kritische Drehzahlen von Torsionswellen), H. Lorenz. Zeitschrift für das gesamte Turbinenwesen, vol. 16, no. 16, June 10, 1919, pp. 149-153, 4 figs. Shaft with one gyrating mass; shaft with several gyrating masses.

Shafts, Whirling of

The Whirling of a Coplanar Crankshaft, J. Morris. Aeronautics, vol. 17, no. 308, Sept. 11, 1919, pp. 258-259, 3 figs. Applies alternative method to cover cases of two-cranked and four-cranked coplanar crankshafts and shows further that same method is applicable to case of crankshaft having any number of coplanar cranks.

Vibrations

Shaking Motion in Coupling Rod Gear (Ueber die Schüttelschwingungen des Kuppelstangenantriebes), Karl E. Müller. Schweizerische Bauzeitung, vol. 74, nos. 12, 13 and 14, Sept. 20, 27 and Oct. 4, 1919, pp. 141-144, 155-158, and 169-172, 14 figs. Deduction of differential equation; calculation of instability area; resonance vibrations; course of rod power in rigid shafts; description of experimental arrangement of apparatus. (Concluded.)

MECHANICAL PROCESSES

Ball Bearings

The Manufacture of Ball Bearings. Automobile Engr., vol. 9, no. 130, Sept. 1919, pp. 305-310, 25 figs. Describing works and equipment of Rudge-Whitworth, Ltd., Birmingham, Eng.

Belting, Rubber

Details of the Manufacture of Rubber Belting. Belting, vol. 15, no. 8, Oct. 20, 1919, pp. 26-27, 4 figs. How crude rubber is gathered, prepared for market, then processed and united with cotton duck in the belting factory.

Blooming Mills

New Davy Brothers Blooming Mills (Nouveaux trains de laminoirs blooming système Davy Brothers), Génie Civil, vol. 75, no. 1936, Sept. 20, 1919, pp. 261-263, 6 figs. At steel works of Bolckow, Vaughan and Co., Middlesbrough (Cleveland), England. Blooming mills have cylinders of 40 in. in diameter. Works will turn out rails and large beams of various sections.

Crushing Plants

Crushed-Stone Plant without Conveyors. Rock Products, vol. 22, no. 19, Sept. 13, 1919, pp. 36-42, 24 figs. Details of Laurin & Leitch Eng. & Construction Co.'s plant near Montreal. Material is elevated once and for all and no rehandling is said to be necessary.

Coal Crushing in a By-Product Coke Oven Plant. Gas Age, vol. 44, no. 8, Oct. 15, 1919, pp. 337-339, 4 figs. Notes on possibilities of coke ovens and use of crushers.

Engines, Marine

Construction of Marine Engines at the Joshua Hendy Iron Works' Plant, H. L. Rexworthy. Pac. Mar. Rev., vol. 16, no. 10, Oct. 1919, pp. 133-134. Engines are of 2800 hp. and of triple-expansion reciprocating type.

Extrusion of Metals

The Extrusion of Metals, J. H. Garnett. Machy. (Lond.), vol. 15, no. 367, Oct. 9, 1919, pp. 43-48, 10 figs. Methods by which process is carried out and description of various presses.

Sanding Machine

Building a Sanding Machine. Machy. (Lond.), vol. 14, no. 363, Sept. 11, 1919, pp. 721-724, 15 figs. Article deals with methods of machining important parts and describes jigs and fixtures used and general procedure in building machines.

Screening

Sand and Gravel Plant Has Concrete Screening Tower and Buildings. Rock Products, vol. 22, no. 21, Oct. 11, 1919, pp. 37-41, 14 figs. Sand and gravel is removed from 40-ft. bank by 2½-cu. yd. bottom-dump cars. Screens are mounted in batteries of twos so that half the gravel goes through each.

MOTOR-CAR ENGINEERING

Caterpillar Tractors

Caterpillars and Their Construction—I, K. H. Condit. Am. Mach., vol. 51, no. 13, Sept. 25, 1919, pp. 601-604, 5 figs. Types built by Holt Mfg. Co., Peoria, Ill.

Diesel Engine

The Diesel Engine and Automobiles, Charles Day. Practical Engr., vol. 60, no. 1703, Oct. 16, 1919, pp. 185-188, 6 figs. Modifications which will be necessary to introduce in present design of Diesel engine to make it applicable to automobile work, particularly in regard to spraying of fuel into cylinders, range of speed, and production of turbulent conditions of gases at time of ignition. Paper read before Inst. Automobile Engrs.

Gas Storage

High-Pressure Gas Storage for Motor Vehicles. Engineering, vol. 108, no. 2799, Aug. 22, 1919, pp. 248-249. Discussion of views contained in report of Inter-Departmental Committee on Gas Traction in regard to manufacture of containers for compressed gas.

Heavy Fuels

Heavy-Fuel Carbureter Type Engines for Vehicles, J. H. Hunt. Jl. Soc. Automotive Engrs., vol. 5, no. 3, Sept. 1919, pp. 202-207, 5 figs. Survey of experiments reported in various technical papers interpreted to indicate that "there is no demonstrated means by which the heavy fuel carburetor engine will improve the fuel situation to any great extent," because "equipments which have shown promising results in service have handled nothing heavier than kerosene."

Impact Tests of Trucks on Roads

Preliminary Report of Impact Tests of Auto Trucks on Roads, E. B. Smith. Public Roads, U. S. Dept. Agriculture, Bur. Public Roads, vol. 2, no. 15, July 1919, pp. 8-10, 3 figs. Also Eng. & Contracting, vol. 52, no. 14, Oct. 1, 1919, pp. 390-392, 3 figs. Apparatus used consisted of heavy steel cylinder in which was fitted plunger 4 in. in diameter and 8 in. long, similar in construction to hydraulic jack. Results indicated general tendency increased impact toward higher speed, although increment of increase was less as speed increased.

Truck Weights

The Economic Limit to Motor-Truck Weights, Robert C. Barnett. Eng. & Contracting, vol. 52, no. 14, Oct. 1, 1919, pp. 374-380, 5 figs. Discussing relation between thickness of pavement and weight of truck, between weight of truck and its capacity, between cost of truck and its capacity. Cost of operation, economic speed and annual cost of transportation. Continuation of article published in E. & C., Jan. 1, 1919.

Valve-Spring Anchorage

Valve-Spring Anchorage. Autocar, vol. 43, no. 1247, Sept. 13, 1919, pp. 399-401, 6 figs. Critical review of various systems frequently adopted in current engine design.

PIPE

Joints

Making of Cement Joints for Cast Iron Pipe, W. M. Henderson. Gas Age, vol. 44, no. 8, Oct. 15, 1919, pp. 343-344, 2 figs. Experience with these joints at Pacific coast. Paper read before Pacific Coast Gas Assn.

Pipe Line

The Yarhola Pipe Line, Wynn Meredith. Eng. World, vol. 15, no. 8, Oct. 15, 1919, pp. 37-43, 12 figs. With notes on field transportation problems which involved 720,000 ton-miles of haul.

POWER GENERATION

Blast-Furnace Gases

Utilization of Blast-Furnace Gases and of Low-Grade Fuels (Utilisation des gaz de hauts-fourneaux et de charbons maigres), P. Moutier. Electricien, vol. 49, no. 1233, July 31, 1919, pp. 42-44. Utilization of gases from blast furnaces considered as important of being developed as utilization of hydraulic energy.

Tidal Power

Proposed Tidal Hydro-Electric Power Development of the Petitcodiac and Memramcook Rivers. Jl. Eng. Inst. Can., vol. 11, no. 10, Oct. 1919, pp. 647-658, 8 figs. Also Can. Engr., vol. 37, no. 15, Oct. 9, 1919, pp. 362-366 and pp. 372-374, 7 figs. Dams and power house at confluence of Petitcodiac and Memramcook Rivers. Initial installation of 90,000 hp. would cost, it is said, about $122 per hp.

Lamson Conveyors

He Swore Us to Secrecy for a Year

WE cannot tell the name of the product in this case. Some time ago we installed a Lamson System in the plant. It made possible an entirely new procedure in an old industry — and that new procedure saved over 5% of manufacturing cost. No competitor could make that saving until that procedure was copied. Hence the need of secrecy.

It is not an uncommon happening that the installation of a Lamson System makes possible a saving in other ways than merely in conveying.

Lamson Conveying Systems are tireless, capable of working twenty-four-hour days seven days a week; they save space; they cut out confusion and congestion; they don't make mistakes, nor drop and smash packages. They carry castings as well as electric-light bulbs, packed boxes as well as hats; they are universally adaptable. They set fixed and orderly pace for production. They place the thing wanted, where it is wanted, just when it is wanted.

The Lamson booklet on Conveying shows some of the many variations of Lamson Systems. We will gladly send a copy upon request, or better, we will instruct our nearest representative to call and show you just how Lamson will fit into your plant and meet your needs. Such a call involves no obligation.

The Lamson Company

Toronto	136 Simcoe St.	Vancouver, B. C.	603 Hastings St.		

Additional Service Stations

Denver, 1622 Arapahoe St. New Orleans 124 St. Charles St. Albany, 22 So. Pearl St Buffalo, 1[illegible]4 Main St. Kansas City, [illegible]10 New Ridge Bldg.

LAMSON SERVICE

Winnipeg

Low-Cost Hydro Power in Winnipeg. Power House, vol. 12, no. 14, Sept. 5, 1919, pp. 381-384, 7 figs. General layout of plant having output of 45,000 hp. generated at 60,000 volts and sent over 65-mile duplicate line which is supported on standard steel towers, 40 ft. high and placed at 500-ft. intervals.

POWER PLANTS

Boiler Explosion

A Boiler Explosion in a Creamery. Power House, vol. 12, no. 16, Oct. 6, 1919, pp. 438-439, 3 figs. Low water and dynamite are conjectured as causes for accident.

Boiler House

Methods of Increasing Boiler-Room Efficiency, D. S. Jacobus. Boiler Maker, vol. 19, no. 8, Aug. 1919, pp. 239-242. Discussion of effect of stoker and furnace on boiler operation with remarks on burner system and comparative study of gas engines and steam installations.

Economy in the Power House, George Frederick Zimmer. Eng. & Indus. Management, vol. 2, no. 12, Sept. 18, 1919, pp. 355-357, 2 figs. Efficient utilization of coal advocated and to minimize waste and increase productiveness writer advises careful handling of coal from colliery to furnace door and scientific burning in grate.

Coal and Ash Handling

Equipment for Handling Coal and Ashes in Power Plants—II, Robert June. Elec. Rev., vol. 75, no. 17, Oct. 25, 1919, pp. 691-692, 1 fig. Influence of methods upon plant operation.

Condensers

The Design of Surface Condensers. Mech. World, vol. 66, no. 1706, Sept. 12, 1919, pp. 124-125. With special reference to Prof. Whitham's formula.

Contraflow System of Utilizing Exhaust

The Contraflo System of Utilizating Exhaust. Power House, vol. 12, no. 15, Sept. 20, 1919, pp. 417-419, 4 figs. It is claimed that by means of this arrangement all heat of the exhaust steam from engine-room auxiliaries is made available and less of heat in main engine exhaust is rejected.

Feedwater Heating

Feed Water Heating, A. R. Hodges. Boiler Maker, vol. 19, no. 9, Sept. 1919, pp. 274-276, 1 fig. Description of heater construction and notes on fuel saved by use of properly designed feedwater heater.

Steam, Superheated, Uses

Industrial Uses of Superheated Steam, Alexander Bradley. Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, pp. 519-522, 5 figs. Tests made by U. S. Steel Corporation on blowing engines said to have indicated average saving of 13.33 per cent.

POWER TRANSMISSION

Belt Transmission

Belt Economy (Rationel Remdrift), Harald Holstein. Teknisk Tidsskrift, vol. 45, no. 33, Aug. 20, 1919, pp. 116-134, 26 figs. Design and calculation of pulleys and belting; belt coupling; graphs.

Problem of Belt-Edge Tear and How to Solve It. Belting, vol. 15, no. 8, Oct. 20, 1919, pp. 17-19, 4 figs. Improper alignment of pulleys believed to be principal cause.

Gearing, Reduction

Gearing as applied to the Marine Steam Turbine, John Houston. Trans. Inst. Mar. Engrs., vol. 31, no. 246, Sept. 1919, pp. 363-387, 4 figs. Design, workmanship and materials of helical spur wheel reduction gear.

PRODUCER GAS

Gas-Producer Practice

Gas-producer Practice at Western Zinc Plants, G. S. Brooks and C. C. Nitchie. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2721-2773, 35 figs. Illustrating details in process of classifying Ill., Ind. and Kan. coals. Among devices noted are Chapman floating agitator installed on remodeled Duff gas producer at roast kilns and various particulars of Hughes gas producer.

Producer-Gas Investigation

Résumé of Producer Gas Investigations, Oct. 1, 1904-June 30, 1910, R. H. Fernald and C. D. Smith. Dept. Interior, Bur. Mines, Bul. 13, 1911, 393 pp., 250 figs. Tests reported were of two classes: (1) made with pressure-producer installation, and (2) made with down-draft producer plant. Efficiencies obtained are interpreted as showing possibility of gas producer as factor in reducing waste in use of coal and lignites and preserving fuel resources of U. S. A.

Sulphur in Producer Gas

Sulfur in Producer Gas, Frederick Crabtree and A. R. Powell. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2687-2692. Method for estimation of carbon bisulphide constituent of commercial gas.

PUMPS

Anthony Steam Pump

"Anthony" Patent Steam Pump. Steamship, vol. 31, no. 364, Oct. 1919, pp. 93-96, 4 figs. Steam distribution gear is mechanically operated, and all working parts are embodied in one complete unit.

Bunsen Aspirating Pump

The Bunsen Aspirating Pump and the Bernouilli Principle, Will C. Baker. Phys. Rev., vol. 14, no. 3, Sept. 1919, pp. 228-233, 3 figs. Usually given application of Bernouilli theorem to Bunsen aspirating pump is shown to be fallacious. Experiments are described that show this pump to be an impact pump.

Pump Selection

Considerations Affecting the Choice of Pumps for Small Water Works, Henry A. Symonds. Mun. & County Eng., vol. 57, no. 4, Oct. 1919, pp. 178-180. Particularly as determined by comparative fuel and first costs of various types.

Pumps, Multi-Stage

Methods of Lifting Sulphuric Acid, Sidney J. Tungay. Chem. Age, vol. 1, no. 12, Sept. 6, 1919, pp. 326-328, 2 figs. Writer traces progress made and describes multi-stage pumps which appear to have solved problem.

REFRACTORIES

Clay

Tests to Determine Uses for Clay, R. F. MacMichael. Brick & Clay Rec., vol. 55, no. 9, Oct. 21, 1919, pp. 762-767, 11 figs. Forms used for recording physical characteristics of clays, methods of testing them in laboratory and examples of curves and data obtained.

Melting Points

Melting Point of Refractory Materials, Leo I. Dana. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1571-1586, 1 fig. Factors and conditions that effect values of melting points and outline of methods for their determination.

Porcelain for Pyrometers

Porcelain for Pyrometric Purposes, Frank H. Riddle. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2207-2217, 3 figs. Comparative study of various kinds of porcelain protecting tubes and notes on their manufacture.

Pyrometer Porcelains and Refractories, R. W. Newcomb. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1975-1977. Concerning selection of protecting tubes.

Pyrometry

Application of Pyrometers to Ceramic Industry, John P. Goheen. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2255-2264, 3 figs. Specially as continuous guide for burning of kilns from start until kiln is finally burned off.

Temperature Measurements

Refractory Materials and High-Temperature Measurements, C. W. Kanolt. Jl. Franklin Inst., vol. 188, no. 4, Oct. 1919, pp. 489-505. Notes on uses of thermocouples, resistance thermometers, optical and radiation pyrometers and pyrometric cones.

REFRIGERATION

Carbonic Anhydride Machine

The Carbonic Anhydride Refrigerating Machine, Peter Neff. A.S.R.E. Jl., vol. 5, no. 4, Jan. 1919, pp. 266-269 and (discussion) pp. 269-271. Conditions existing with regard to this type of apparatus in United States.

Clothel Refrigerating Machine

Test of Two-Ton Clothel Refrigerating Machine, M. C. Stuart. Jl. Am. Soc. Naval Engrs., vol. 31, no. 3, Aug. 1919, pp. 624-634, 6 figs. Refrigerant used was Ethyl-Chloride. Results showed that refrigerating effect was increased with higher brine temperatures and lower circulating water temperatures; with circulating water temperature of 70.1 deg. fahr. net refrigerating effect was 2.13 tons per day.

Gas Warfare

Refrigeration in Connection with Gas Warfare, A. M. Heritage. Am. Soc. Refrig. Engrs. Jl., vol. 5, no. 6, May 1919, pp. 403-415, 14 figs. Methods used, particularly in connection with transfer of phosgene from drums into system for filling shells and other projectiles.

Industrial Applications

Industrial Applications of Refrigeration, Charles L. Hubbard. Indus. Management, vol. 58, no. 4, Oct. 1919, pp. 289-294, 13 figs. Illustrating such applications as are employed for preservation of food, cooling of drinking water, control of certain chemical reactions, cooling workrooms, manufacturing confections and many others.

Machinery Arrangement

Machinery and Pipe Arrangement—XXIII, C. C. Pounder, Mech. World, vol. 66, no. 1711, Oct. 17, 1919, p. 186, 5 figs. In refrigerating plant. (Continuation of serial.)

Plant Efficiency

Refrigerating Plant Efficiency, George Naylor. Power House, vol. 12, no. 15, Sept. 20, 1919, pp. 420-421. Significance of correct proportioning for securing maximum operating plant economy.

Railroad Car Precooling

Precooling Loaded Refrigerator Cars. Ice & Refrigeration, vol. 57, no. 4, Oct. 1919, pp. 133-140, 5 figs. Commercial aspect of railroad car precooling studied from records of actual operation.

Storage, Cold, Plant

British Design for small Cold Storage. Ice & Refrigeration, vol. 57, no. 4, Oct. 1919, pp. 144-146, 6 figs. Sketch design for warehouse of about 120 tons capacity which can be constructed for approximately $40,000 exclusive of cost of land.

Improved Cold-Storage Methods a Means to Better World Provisioning, F. E. Matthews. Am. Soc. Refrig. Engrs. Jl., vol. 5, no. 6, May 1919, pp. 416-426 and (discussion) pp. 426-433. Extension and improvement of cold storage emphasized by statements in U. S. Government reports that 15 per cent of all food stuffs grown in this country is wasted before it reaches market, and that 25 per cent of amount reaching market is wasted before it reaches consumer.

Synchronous Motors

Synchronous Motors for Refrigerating Compressor Operation. Power Plant Eng., vol. 23, no. 21, Nov. 1, 1919, pp. 992-993, 2 figs. Installation of Brooklyn ice plant which consists of six 15 x 15 in. compressors driven in sets of 2 x 3 350-hp. direct-connected synchronous motors.

RESEARCH

Agriculture

Problems and Methods in Agricultural Research, H. J. Wheeler. Jl. Indus. & Eng. Chem., vol. 11, no. 11, Nov. 1, 1919, pp. 1056-1060. Warns against types of work from which false and misleading conclusions have been drawn.

Chemical Engineers, Canada

The Value of Scientific Work and the Training of Chemical Engineers in Canada. Can. Chemical Jl., vol. III, no. 10, Oct. 1919, pp. 335-340. From report of proceedings of Chemistry Committee of Honorary Advisory Research Council.

Foundries and Machine Shops

The Necessity and Advantages of a Laboratory in Foundries and Machine Shops (Gesichtspunkte über die Notwendigkeit und den Nutzen eines Laboratoriums für eine Giesserei und Maschinenfabrik), Fr. Meese. Giesserei-Zeitung, vol. 16, no. 14, July 15, 1919, pp. 209-214, 6 figs. One of advantages claimed is that by determining injurious factors it is possible to reduce inferior or rejected grades to minimum. Photomicrographs.

Minerals, Non-Metallic

Non-metallic Mineral Research. Cement, Mill & Quarry, vol. 15, no. 8, Oct. 20, 1919, pp. 27-31. Observes that war work of Bureau of Mines provides foundation for valuable development of industrial minerals if properly encouraged by cement, mill and quarry industries.

Organization and Equipment

Industrial and electrical Laboratories (Les laboratoires d'usines et d'électricité industrielle), G. Lebaupin. Electricité, vol. 49, no. 1232, July 15, 1919, pp. 8-13, 4 figs. Suggestions in regard to organization and selection of equipment.

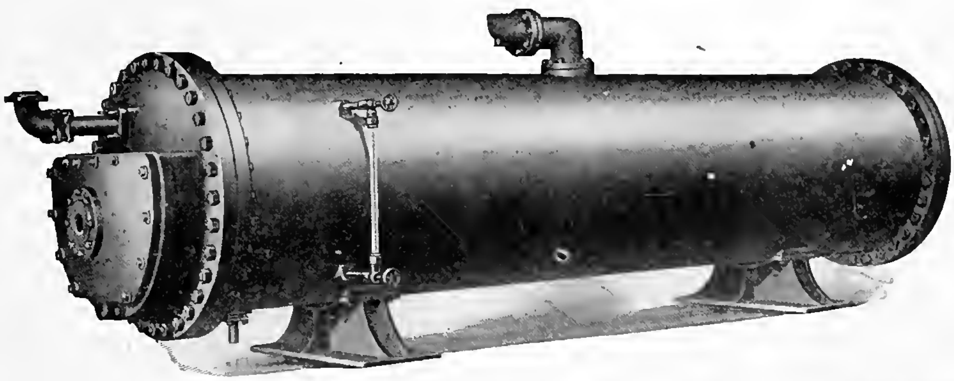
Vogt

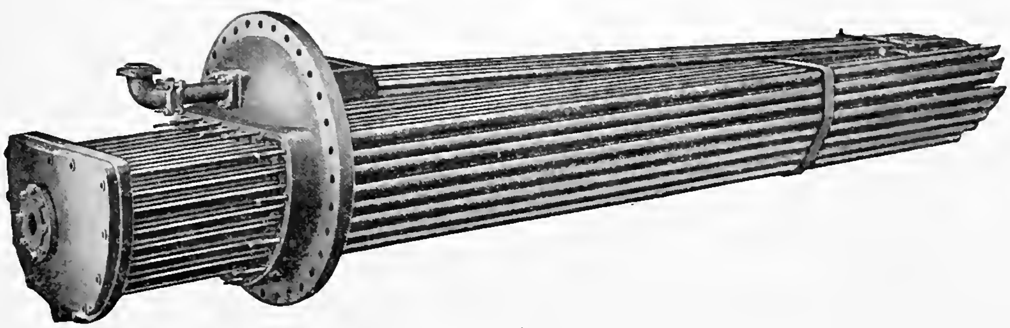
ICE MAKING AND REFRIGERATING MACHINERY

Engineers prefer—

the VOGT EXHAUST STEAM AMMONIA GENERATOR, on account of its SUPERIOR FEATURES, which are—

No
- Return Bends
- Bent Pipe
- Exposed Heating Surface
- Stuffing Boxes on Steam Coils
- Thread Joints inside of Shell





Patented

Henry Vogt Machine Company

Louisville, Ky.

SPECIFICATIONS

Creosote Oil

Specifications for Creosote Oil. Bul. Am. Ry. Eng. Assn., vol. 21, no. 217, July 1919, pp. 30-40, 12 figs. Including precautions to be followed in purchase and use of creosote-coal-tar solutions. Adopted by Association on recommendation of one of its committees.

Steel

Standard Specifications for Steel. Times Eng. Supp., vol. 15, no. 540, Oct. 1919, pp. 301-302. Their possibilities and uses.

Specifications for High Speed Steels, B. Polikoff. Mech. World, vol. 66, no. 1706, Sept. 12, 1919, pp. 128-129. Description of test tools and discussion of European practice and test factors.

STANDARDS AND STANDARDIZATION

Concrete-Reinforcement Bars

Concrete Reinforcement Bars rolled from Billets. Assn. Am. Steel Manufacturers pamphlet, Mar. 22, 1910. Standard specifications revised 1912 and Apr. 21, 1914.

Economical Results of Standardization

Engineering Standardisation, Gerald Lightfoot. Commonwealth Australia Inst. Sci. & Industry, Pamphlet no. 2, 1919, 30 pp., 1 fig. Economical results of standardization work carried out in England, America and Japan quoted as argument for convenience of introducing engineering standardization in Australian industry.

STEAM ENGINEERING

Boiler Explosions

Boiler Explosions, F. Carruthers. Mar. Engr. & Naval Architects, vol. 42, no. 505, Oct. 1919, pp. 81-82, 2 figs. Explosion of multitubular marine type boiler in steel cargo steamer found from inquiry to have been caused by overheating of tube ends and combustion chamber plates, due to accumulation of scale on their surfaces on water side.

Feeding Water-Tube Boilers

The Feeding of Water Tube Boilers (Das Speisen von Wasserrohrkesseln). Zeitschrift des Bayerischen Revisionsvereins, vol. 23, no. 7, Apr. 15, 1919, pp. 49-51. The arrangement of the feed pipe and its relation to water circulation and safety of boilers.

Flues

Flues for Internally-Fired Boilers—II, W. H. Grantham. Mech. World, vol. 66, no. 1708, Sept. 26, 1919, p. 151, 5 figs. British Board of Trade formula for computing working pressure for flues having sections connected together by joints. (Continuation of serial.)

Hochwald Piston Valve

See Piston Valves.

Piston Valves

Steam Engines with Shaft Governor and Piston Valve with automatic Compression Control (Dampfmaschinen mit Achsregler und Kolbenschieber mit selbsttätiger Regulierung der Verdichtung), M. Hochwald. Zeitschrift des Bayerischen Revisionsvereins, vol. 23, no. 7, Apr. 15, 1919, pp. 52-53, 4 figs. Description of the Hochwald piston valve, which automatically controls compression under varying working and filling conditions.

Turbines

The Westinghouse Rateau Reducing Pressure Steam Turbine. Mech. World, vol. 66, no. 1709, Oct. 3, 1919, pp. 163-165, 4 figs. Designed to satisfy requirements of industrial concerns such as chemical works, textile works, sugar factories, which, besides needing supply of steam of comparatively low pressure for heating, boiling, and drying processes, also requires supply of electric power for general purposes.

TEXTILES

Yarn and Acids

The Action of Dilute Sulphuric Acid Solutions upon the Tensile Strength of Cotton Yarn, Walter A. Lawrence. Can. Chemical Jl., vol. 111, no. 10, Oct. 1919, pp. 329-331, 4 figs. Experimental investigation described as having shown that cotton fibres are sensitive to very dilute sulphuric acid solutions, specially when allowed to dry on fibre, the higher the temperature of solution containing inorganic acid, the higher being the temperature of drying cotton treated with such a solution.

THERMODYNAMICS

Gas Explosion Phenomena

The Effect of Carbon Dioxide when present in inflammable gaseous Mixtures on Explosion Phenomena, W. T. David. Engineering, vol. 108, no. 2801, Sept. 5, 1919, pp. 300-302, 6 figs. Pressure records obtained for explosions of following mixtures: (1) 20.7 per cent coal-gas, 26.3 per cent oxygen and 53 per cent CO_2; (2) 15 per cent coal-gas, 26.4 per cent oxygen and 58.6 per cent CO_2; (3) 15 per cent coal-gas, 19.7 per cent oxygen and 65.3 per cent CO_2.

Heat Transmission

Heat Transmission of Steam containing Air to Water (Die Wärmeübertragung von lufthaltigem Dampf an Wasser), L. Schneider. Zeitschrift des bayerischen Revisions-Vereins, vol. 23, no. 11, June 15, 1919, pp. 85-87, 2 figs. It is claimed that even small quantities of air in steam reduce heat transmission by 50 and even 75 per cent.

WELDING

Electric Welding

Direct and Alternating Current Welding, A. M. Candy. Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, pp. 484-486, 4 figs. Schemes of connections.

Electric Welding: Its Theory, Practice, Application and Economics, H. S. Marquand. Elecn., vol. 83, no. 2157, Sept. 19, 1919, pp. 300-302, 7 figs. Description of various methods of preparing welds; illustrations of various kinds of work and discussion of economies effected by machine welding. (To be concluded.)

Electrodes, Chemical Composition

Effects of the Chemical Composition of Welding Electrodes, J. S. Orton. Am. Mach., vol. 51, no. 13, Sept. 25, 1919, pp. 625-626. Results of tests made by Welding Research Committee of Shipping Board.

Portable Welding Outfits

Arc Welding for the Commercial Welding Shops, Robert E. Kinkead. Welding Engr., vol. 4, no. 10, Oct. 1919, pp. 42-44, 4 figs. Illustrating various portable welding outfits.

Quasi-Arc Welding

Quasi-Arc Welding, L. B. Dickerson. Southern & Southwestern Ry. Club, vol. 15, no. 4, July 1919, pp. 6-29, 16 figs. Outline of scientific principles upon which electric welding depends.

Slot Cutting

Milling Machine versus Oxy-Acetylene Machine. Can. Machy., vol. 22, no. 14, Oct. 2, 1919, pp. 349-350, 2 figs. Descripton of work done by straight line cutting blowpipe in cutting slots in slip socket.

Soldering

Solder, Soldering Flux and Soldering, F. A. Kartak. Power Plant Eng., vol. 23, no. 21, Nov. 1, 1919, pp. 975-977, 2 figs. Solders and fluxes required for soft and hard soldering of various metals.

Tipping Device

Improved Tipping Device for Oxy-Acetylene Welding Table, J. T. Smoody. Eng. & Min. Jl., vol. 108, no. 13, Sept. 27, 1919, pp. 553-554, 1 fig. Advantages claimed are positive lock from worn gears and one-man adjustment of table.

Weld-Metal Analysis

Determination of Oxygen and Nitrogen in Electric Weld Metal, J. H. Paterson and H. Blair. Jl. Soc. Chem. Indus., vol. 38, no. 17, Sept. 15, 1919, pp. 328T-330T. Suggested method in which electrolytic hydrogen is passed through tower filled with soda-lime and wash bottle containing strong sulphuric acid and from thence is carried into silica tube filled with fine iron borings and heated to bright redness in tube furnace, where any trace of oxygen contained in gas is reduced to water.

WOOD

Fungi

Fungi, the Cause of Decomposition of Timber, P. H. Dudley. Bul. Am. Ry. Eng. Assn., vol. 21, no. 217, July 1919, pp. 49-63, 12 figs. Illustrating how antiseptic arrests decomposition of lumber and timber.

Jarrah

See Seasoning.

Pattern Making

Pattern Turning—II, Joseph A. Shelley. Machy. (Lond.), vol. 15, no. 366, Oct. 2, 1919, pp. 10-15, 17 figs. Equipment required and methods used in turning shoulders, fillets, small core-prints, cylindrical patterns and irregular forms.

Seasoning

On the Rapid Seasoning of Jarrah, Alfred Tomlinson. Engineering, vol. 108, nos 2800 and 2801, Aug. 29 and Sept. 5, 1919, pp. 287-289 and 323-325, 13 figs. Illustrating forms of (1) progressive, and (2) compartment classes of kilns for drying timber. Results of experiments. (To be continued.) Paper read before Western Australia Instn. of Engrs.

VARIA

Diamond Polishing

Diamond Polishing. Times Eng. Supp., vol. 15, no. 540, Oct. 1919, p. 310. An industry for disabled soldiers.

Grindstone Manufacture

The Manufacture of the artificial Grindstone of Carborundum, Y. Nakazawa (in Japanese). Denki Gakkwai Zasshi, no. 374, Sept. 10, 1919.

Organization and Management

ACCOUNTING

Cost Accounting

Fundamentals of Uniform Cost Accounting System for the Concrete Pipe and Tile Industry, G. A. Schonlau. Cement & Eng. News, vol. 31, no. 10, Oct. 1919, pp. 24-26. A reliable system of cost and financial accounting should record, it is said, where every item of material and time and expense goes in making of product or in process of buying and selling goods.

Cost Keeping

See Office Routine.

Costs

Relationship of Items of Cost under Pre-war Conditions and To-day, F. W. Doolittle. Elec. Ry. Jl., vol. 54, no. 15, Oct. 11, 1919, pp. 9-11. Effect of higher cost of labor and materials of construction is analyzed and illustrated by example. Paper presented before Am. Elec. Ry. Assn.

Foundry

Handling Costs in a Steel Foundry, Clifford E. Lynn. Iron Trade Rev., vol. 65, no. 18, Oct. 30, 1919, pp. 1179-1180, 7 figs. Forms used in foundry cost keeping.

Mechanical Devices

Mechanical Devices in Railroad Accounting, S. O. Price. Ry. Rev., vol. 65, no. 17, Oct. 25, 1919, pp. 600-601, 3 figs. Cards used in classifying wages and for showing cost statement of additions and betterment work.

Office Routine

Cost Records for Cost-Plus-Fixed-Fee System, F. A. Wells. Contract Rec., vol. 33, no. 41, Oct. 8, 1919, pp. 944-947, 5 figs. Illustrating office routine of purchase order, invoices and vouchers.

Cost Keeping under Cost-Plus-Fixed-Fee Contracts, F. A. Wells. Eng. & Contracting, vol. 52, no. 16, Oct. 15, 1919, pp. 447-449, 6 figs. Illustrating purchase orders, invoices and vouchers.

Overhead

The Overhead Cost in Contracting, Dan. Carey. Eng. & Contracting, vol. 52, no. 17, Oct. 22, 1919, pp. 463-465. Importance of correctly estimating overhead costs and suggestions in regard to figuring them.

Records

The Block-Number System. Machy. (Lond.), vol. 15, no. 366, Oct. 2, 1919, pp. 7-9, 3 figs. Illustrating various methods of keeping records.

EDUCATION

Engineering Colleges

Engineering Colleges and Administration, Ira N. Hollis. Eng. Education, vol. 10, no. 2, Oct. 1919, pp. 33-68. Recommends that time of teacher be occupied with administration as little as possible, and that national engineering societies coöperate with Society for Promotion of Engineering Education and with colleges themselves towards broadening out engineering education.

EXPORT

Boilers

Foreign Demand for American Boilers, L. W. Alwyn-Schmidt. Boiler Maker, vol. 19, no. 9 Sept. 1919, pp. 271-272. Establishment of liberal foreign credit emphasized as necessary to open up extensive field for American boiler products.

Cement

International Trade in Cement. Cement, Mill & Quarry, vol. 15, nos. 6 and 8, Sept. 20 and Oct. 20, 1919, pp. 15-19 and 35-39. Statistics of imports into foreign countries; although figures mentioned were compiled from pre-war data, they may serve as basis to guide American manufacturers in computing and obtaining share of cement trade of the world. This article deals with imports into France, Germany and Mexico. Export opportunities in Spain, Portugal and South America are quoted.

FACTORY MANAGEMENT

Code Calling

Code Calling in Factories, V. Karapetoff. Indus. Management, vol. 58, no. 4, Oct. 1919, pp. 306-308, 1 fig. Points out advantages of electro-acoustic systems for increasing effectiveness of management and promoting good will among executives and employees.

Audible Signals in the Foundry, Vladimir Karapetoff. Iron Trade Rev., vol. 65, no. 14, Oct. 2, 1919, pp. 894-895, 2 figs. Suggested electrical calling mechanism. Paper presented before Am. Foundrymen's Assn.

Control Board

How I know where each Job stands, C. E. Fairbanks. Factory, vol. 23, no. 5, Nov. 1919, pp. 1036-1038, 1 fig. Chart mounted on control board warning of minimum stocks.

Employment

Placing the right Man in the right Job, W. D. Stearns. Machy. (N. Y.), vol. 26, no. 2, Oct. 1919, pp. 136-139, 4 figs. Methods used by Westinghouse Electric Manufacturing Co., East Pittsburgh, for analyzing jobs and classifying them with a view to obtaining standard wage rates. Second of two articles.

Foundries

System is a Factor in Production, W. C. Briggs. Foundry, vol. 47, no. 333, Oct. 15, 1919, pp. 735-737, 3 figs. Standardizing and classifying flasks and adopting plan based upon requirements of work as essentials in increasing output of foundry. Paper presented before Am. Foundrymen's Assn.

Graphic Control

Graphic Metallurgical Control, H. M. Merry. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2313-2321, 5 figs. Methods and records developed for use of executives of copper company in New Mexico. Particular attention is directed to use of large wall-charts, reference display of large charts, scale notation of metallurgical charts and inclusion of mesh extraction on screen-analysis diagrams.

Layout

New National Acme Screw Products Plant. Machy. (N. Y.), vol. 26, no. 2, Oct. 1919, pp. 120-122, 5 figs. Special attention is called to arrangement of plant which permits material to pass in one continuous stream through shop.

Laundry

The Factory Laundry. Eng. & Indus. Management, vol. 2, no. 16, Oct. 16, 1919, pp. 488-489, 3 figs. Details of establishment used in factory for washing overalls, caps, refectory table-cloths and lavatory towels.

Machine-Tool Plant

Organization and Management of a Machine Tool Plant—IV. Machy. (Lond.), vol. 14, no. 363, Sept. 11, 1919, pp. 711-716, 7 figs. Dealing with factory control, departmental efficiency records, progress reports, advertising department, employment department.

Production Manager

The Production Manager and the Progress Chief, W. J. Hiscox. Machy. (Lond.), vol. 14, no. 362, Sept. 4, 1919, pp. 693-694, 1 fig. Defining duties of both, viz., for one to get the work and the other to produce the article, writer claims that there are many firms who, although they accept the principle in connection with appointment of business manager and works manager, will not adopt it in connection with the factory organization.

Progress Chief

See Production Manager.

Repetition Work

Seek Economy in Repetition Work. Foundry, vol. 47, no. 18, Nov. 1, 1919, pp. 761-766, 13 figs. Arrangement of factory which manufactures parts for electric washing machines, ironers and vacuum cleaners. Machines are made in only a few standard heights and this keeps down number of patterns required.

Scientific Management

Scientific Management—V, Henry Atkinson. Eng. & Indus. Management, vol. 2, no. 13, Sept. 25, 1919, pp. 402-406, 4 figs. Charts suggesting organization for general engineering works.

Positive Contributions of Scientific Management. The Elimination of some Losses characteristic of present-day Manufacture, Henry H. Farquhar. Bul. Taylor Soc., vol. 4, no. 5, Oct. 1919, pp. 15-28. Mechanical aspects of scientific management are seen to be increased production, decreased cost, stimulus of knowledge. Human factors enumerated are industrial peace, high wages, proper working hours, promotion of health and well-being, free scope for individual initiative, opportunity for advancement and reduction of labor turnover.

Taylor's Principles in modern British Management, Robert Stelling. Eng. & Indus. Management, vol. 2, no. 15, Oct. 9, 1919, pp. 451-456. Writer explains principles of F. W. Taylor system. He observes that their adoption means shouldering of responsibility by management and that disinclination to do this must be overcome by education before a start can be made.

Signals

See Code Calling.

Working Conditions

The Influence of Hours of Work and of Ventilation on Output in Tinplate Manufacture, H. M. Vernon. Eng. & Indus. Management, vol. 2, nos. 14 and 15, Oct. 2 and 9, 1919, pp. 419-423 and 466-472, 7 figs. Records obtained at various plants in regard to effect in output of reducing working day from eight to six hours. Seasonal variation of output and its relation to surrounding temperature and ventilation. Report of Indus. Fatigue Research Board.

INSPECTION

Automobile Work

Defective Work. Automobile Engr., vol. 9, no. 130, Sept. 1919, pp. 286-288, 1 fig. Causes of and some suggestions for reducing rejections.

Leather Belting

Inspection of Leather Belting, Harry A. Hey. Indus. Management, vol. 58, no. 4, Oct. 1919, pp. 273-281, 20 figs. Methods for predetermination of performance and durability, noting special apparatus required for effecting tests.

LABOR

Engineers

Classification and Salaries of Engineers. Can. Engr., vol. 37, no. 17, Oct. 23, 1919, pp. 397-402. Schedule adopted by Toronto engineers includes titles, qualifications, and minimum salaries for technically trained men ranging from $1,200 to $12,000 per annum.

Housing

Building on a "Unit" System. Iron & Coal Trades Rev., vol. 99, no. 2691, Sept. 26, 1919, pp. 415-416, 2 figs. Arrangement for artisan's dwellings suggested by London company.

Colliery of Granby Consolidated Mining Smelting and Power Co., Ltd., E. A. Haggen. Min. & Eng. Rec., vol. 24, no. 15, Aug. 15, 1919, pp. 209-219, 21 figs. Plans and details of industrial homes provided for workers are included.

The Report of the U. S. Housing Corporation. Am. Architect, vol. 116, no. 2283, Sept. 24, 1919, pp. 399-408 and 412-414, 15 figs., partly on supp. plates. Illustrated with examples of community and group building.

Solving the Industrial Housing Problem. Am. Drop Forger, vol. 5, no. 10, Oct. 1919, pp. 491-493, 4 figs. How Westinghouse Airbrake Co. formed new company to handle situation at Welmerding, Pa.

A Plan for Industrial Peace, Stephen C. Mason. Am. Industries, vol. 20, no. 3, Oct. 1919, pp. 7-8. Suggests entering into agreement containing, among other features, strongly worded provision pledging employers to give employees honest and generous day's pay, workers in turn pledging themselves to give honest and generous day's work.

Relations between Employer and Employee, Wm. M. Leiserson. Monthly Labor Rev., vol. 9, no. 4, Oct. 1919, pp. 207-216. Suggestions in regard to planning labor relations policy and creating labor administration organization.

Industrial Overstrain and Unrest, Charles S. Myers. Eng. & Indus. Management vol. 2, no. 16, Oct. 16, 1919, pp. 483-485. Determination of hours of labor and periods of rest in factories as well as distribution of periods of labor and rest during day, seen as questions which can best be settled by establishing National Institute of Psycholology and Physiology, applied to Industry and Commerce, such as advocated in Eng. & Indus. Management of Sept. 25.

Labor Turnover

Labor Turnover in Chicago, Emil Frankel. Monthly Labor Rev., vol. 9, no. 3, Sept. 1919, pp. 44-59. Summary of results of inquiry made by Bur. of Labor Statistics into nature and extent of labor turnover in Chicago during war period.

Running away from Work and Jobs, Dale Wolf. Indus. Management, vol. 58, no. 4, Oct. 1919, pp. 269-271. Based on experience of writer who visited and investigated conditions in 32 plants representing various industries and a few mercantile establishments.

Language

The one Language industrial Plant, Winthrop Talbot. Indus. Management, vol. 58, no. 4, Oct. 1919, pp. 313-320. It is observed that over 500 industrial plants have found it good business to establish language classes for foreigners in their employ. Difficulties which are encountered in this form of teaching and manner in which they can be overcome are exposed.

Profit Sharing

The Industrial Problem, Charles Plez. Pac. Mar. Rev., vol. 16, no. 10, Oct. 1919, pp. 96-98. Profit sharing and partnership discussed as remedies for labor unrest.

A Means of Harmonising Capital and Labour, Frank Graham. Eng. & Indus. Management, vol. 2, no. 16, Oct. 16, 1919, pp. 498-500. Advocates copartnership or profit sharing in industrial enterprises.

Vocational Training

Management and Training of Employes, W. W. Gidley. Coal Industry, vol. 2, no. 10, Oct. 1919, pp. 471-473. Results of vocational training of worker in industries said to lie in convincing him that real efficiency reflects and conserves human element and increases earning power.

Wages

Cost of Living in Relation to Wage Adjustments, LeRoy D. Williams and Alfred B. Holt. Bul. Taylor Soc., vol. 4, no. 5, Oct. 1919, pp. 29-46, 4 figs. Research made at works of Holt Mfg. Co., Peoria, Ill.

A Defense of the Piece Rate Method of Wage Payment, Leon Bing. Indus. Management, vol. 58, no. 4, Oct. 1919, pp. 325-327. It is claimed that there are no practical administrative or psychological objections to any piece-rate system involved that cannot be removed by right-minded management.

Women

Women in Industry. Monthly Labor Rev., vol. 9, no. 4, Oct. 1919, pp. 217-221. Output of women workers in relation to hours of work in shell making.

Works Councils

Austrian Law Establishing Works Councils. Monthly Labor Rev., vol. 9, no. 3, Sept. 1919, pp. 133-134. Election of workers' councils is made obligatory in establishments and factories where at least 20 workers are employed continuously for wages.

German Workers' Councils—Their Organizations and Functions, Alfred Maylander. Monthly Labor Rev., vol. 9, no. 3, Sept. 1919, pp. 125-133. Status planned for workers' councils in new economic structure of Germany. Article is based on announcement of government as to its legislative program with respect to workers' councils, comments in German press on this program, and resolutions adopted by second congress by workers' councils.

Works Council Serves as Court. Iron Trade Rev., vol. 65, no. 16, Oct. 16, 1919, pp. 1041-1043. Method of industrial administration followed by International Harvester Co. Right of appeal and arbitration are among important features of plan.

Tenth German Trade-Union Congress, Nuremberg, June 30 to July 5, 1919. Monthly Labor Rev., vol. 9, no. 4, Oct. 1919, pp. 284-290. Public boycott, work councils and joint industrial leagues discussed among other topics.

Taylor-Wharton Plan. Eng. & Indus. Management, vol. 2, no. 14, Oct. 2, 1919, p. 439. Details of Work Council by which employees share in management.

LEGAL

Resale Prices

The Fixing of Resale Prices—III, Chesla C. Sherlock. Am. Mach., vol. 51, no. 13, Sept. 25, 1919, pp. 604-605. Decisions of bar studied in order to determine extent to which law sanctions restraint of trade.

Trademarks

The Use of Trade-Marks—I. Chesla C. Sherlock. Am. Mach., vol. 51, no. 14, Oct. 2, 1919, pp. 651-653. Difference between patent and trade-mark emphasized, and attitude of courts in regard to protection provided by trade-marks explained.

RECONSTRUCTION

European Industrial Needs

Industrial Needs of Europe Outlined. Iron Trade Rev., vol. 65, no. 18, Oct. 30, 1919, pp. 1197-1199. Opinions expressed at International Conference held at Atlantic City under auspices of Chamber of Commerce of U. S.

Machine-Tool Industry

From Engines of War to Instruments of Peace, W. H. Lloyd. Iron Trade Rev., vol. 65, no. 15, Oct. 9, 1919, pp. 974-981, 18 figs. Conditions in machine tool industry.

SAFETY ENGINEERING

Accident Classification

"Safety First"—Criticism of Accidents. Ry. Gaz., vol. 31, no. 13, Sept. 26, 1919, pp. 391-393, 3 figs. Great Western Railway's (England) system of classifying and recording causes of accidents.

Accident Reduction by Bonus

The Foreman's Bonus for Accident Reduction, Lucian W. Chaney. Monthly Labor Rev., vol. 9, no. 3, Sept. 1919, pp. 272-281. From statistics it is concluded that foreman's bonus for accident reduction tends very greatly to reduce minor injury but it does not necessarily operate to satisfactory reduction of more severe accidents. It is suggested that the bonus be reinforced by vigorous application of other measures.

Accidents

Industrial Accidents, Lucian W. Chaney. Monthly Labor Rev., vol. 9, no. 4, Oct. 1919, pp. 222-232, 1 fig. War-time trend of employment and accidents in a group of steel mills.

Cement Manufacture

Hazards of Cement Manufacture, R. Frame. Cement, Mill & Quarry, vol. 15, no. 7, Oct. 5, 1919, pp. 15-17. Based on experience of Alpha Co. at eight stock houses and six packing rooms during period from Jan. 1, 1918 to July 31, 1919.

Electrical Hazards

Industrial Safety—III, F. H. Reid. Power Plant Eng., vol. 23, no. 19, Oct. 1, 1919, pp. 873-874. Electrical hazards. Discussing power circuits, trolley wires, crowded shop conditions, etc. From lecture delivered before Schools for Safety Engrs., of Nat. Safety Council.

Erection, Steel

Safety Measures for Preventing Accidents in Steel Erection, E. A. Gibbs. Eng. & Contracting, vol. 52, no. 17, Oct. 22, 1919, pp. 460-461. Necessity for employing suitable equipment and selecting proper men for particular tasks is emphasized. Paper read before Eighth Annual Safety Congress.

Explosives

Safety Factors in Use of Explosives in Rock Quarrying, Walter O. Snelling. Cement, Mill & Quarry, vol. 15, no. 7, Oct. 5, 1919, pp. 27-31. Precautions to observe while firing, loading, tamping cartridge and preparing charge. It is particularly advised to avoid making electrical connections in too great haste while connecting up blast.

Safety Measures in Blasting Operations. Contract Rec., vol. 33, no. 42, Oct. 15, 1919, pp. 967-968. How to handle explosive to eliminate danger. Third Article.

See also MINING ENGINEERING, Explosives.

Fire Protection

Fire Protection for Military Establishments in the Home Commands. "Red Books" of the British Fire Prevention Committee, no. 206, London, 1917, 48 pp. Dangers of fire, fire-protective arrangements and fire service organization at military establishments.

The Legislation and Administration of the Fire Brigade Service of the United Kingdom together with a Scheme for its Reorganization, H. S. Bell. "Red Books" of the British Fire Prevention Committee, no. 233, 1919, 60 pp. Scheme proposed aims at remedying inefficiency of local authority brigades and absence of power to compel such authority to provide brigade in cases of necessity.

Hoisting Operations

Safety Measures in Hoisting Operations. Contract Rec., vol. 33, no. 43, Oct. 22, 1919, pp. 984-986, 1 fig. Precautions to observe about location of equipment, brakes, signals, selection and care of cables, and operators.

Mine Safety

Electrical Apparatus and Mine Safety, Graham Bright. Coal Indus., vol. 2, no. 9, Sept. 1919, pp. 370-372. Outlines safety precautions in installation of electrical apparatus at mines, with special reference to equipment for gaseous mines, power plants, fans, hoists, pumps and general conditions.

Safety Committees

Safety Committees in Workshops. Eng. & Indus. Management, vol. 2, no. 16, Oct. 16, 1919, pp. 493-494. Suggestions offered in pamphlet published by British Government in regard to duties of committees.

Methods of selecting Committees and maintaining Interest in Safety. Railroad Herald, vol. 23, no. 11, Oct. 1919, pp. 21-23. Suggests use of statistics either in statement form or by graphic chart showing common causes of accidents and class of employees suffering therefrom.

Safety Measures

The Fundamental Principles of Safeguarding, Sidney J. Williams. Can. Machy., vol. 22, no. 17, Oct. 23, 1919, pp. 410-411 and 415. Devices guarding every moving part, wherever located, on which workman might be injured if he came in contact with it in any way, or from any cause whatsoever. Paper read before Eighth Annual Safety Congress.

Steel Plants

Promoting Safety in Steel Plant, H. P. Heyne. Iron Trade Rev., vol. 65, no. 17, Oct. 23, 1919, pp. 1110-1111. It is noted that main qualification of safety engineering must be to study human nature and to be capable of winning coöperation of all employees. Experiences of one company in reducing accidents are quoted. Paper read before National Safety Council.

See also Accidents.

Welding

Oxy-acetylene and the Safety First Movement, A. Cressy Morrison. Can. Machy., vol. 22, no. 15, Oct. 9, 1919, pp. 372-375. Address delivered before Western Pa. Division of National Safety Council.

West Virginia

Progress in Rescue and First Aid in W. Va., W. J. Heatherman. Coal Indus., vol. 2, no. 9, Sept. 1919, pp. 356-358, 2 figs. Claims that West Virginia is foremost state in first-aid, rescue and mining education; it has seven rescue stations.

SALVAGE

Foundry Practice

Educational Value of the Scrap Pile, Henry Traphagen. Iron Trade Rev., vol. 65, no. 14, Oct. 2, 1919, pp. 892-893. Said to lie principally in affording opportunity to study conditions in foundry practice. Paper presented before Am. Foundrymen's Assn.

Oil and Waste

Reclaiming Waste and Oil, J. Emile Coleman. Machy. (N. Y.), vol. 26, no. 2, Oct. 1919, pp. 132-133, 1 fig. Outfit consisting of steam turbine-driven centrifugal machine, in which oil is extracted by centrifugal force, waste is washed in boiling water and subsequently rinsed in fresh water and finally dried centrifugally.

New Process for Removing and Salvaging Oil in Copper Manufacture (Die neue Entölungs und Oelrückgewinnungsanlage für die Rheinisch-Westfal. Kupferwerke Akt. Ges. Olpe Westfalen), Meukner. Gesundheits-Ingenieur, vol. 42, no. 27, July 5, 1919, pp. 273-274, 2 figs. Description of installation.

Paper Manufacture

Centrifugal Device as Mill Save-All. Paper, vol. 25, no. 3, Sept. 24, 1919, pp. 21-23, 11 figs. Describing apparatus for recovering pulp fibers, etc., from liquids.

Rubber Factories

Reducing Waste in Rubber Factories, Robert C. Kelley. India Rubber World, vol. 61, no. 1, Oct. 1, 1919, pp. 7-9, 4 figs. Forms of scrap reports and methods for handling waste.

TRANSPORTATION

Automobile Factories

Automobile Factory Transportation Systems, Edward K. Hammond. Machy. (N. Y.), vol. 26, no. 2, Oct. 1919, pp. 123-128, 10 figs. Also Machy. (Lond.), vol. 15, no. 357, Oct. 9, 1919, pp. 33-38, 10 figs. Types of equipment used for transporting raw materials and parts of product through plant of Willys-Overland Co., Toledo, O.

Contractor's Trucks

Maintenance Methods for Contractor's Trucks. Commercial Vehicle, vol. 21, no. 5, Oct. 1, 1919, pp. 170-172, 5 figs. Details of solution of special problems created by severe service and necessity for speed in contract.

Electric Trucks

Industrial Electric Trucks and Tractors in Machine Shops, Bernard J. Dillon. Elec. Rev., vol. 75, no. 17, Oct. 25, 1919, pp. 683-685, 4 figs. Illustrating various applications to hauling materials around shop and lifting them on to machines.

Electrical Engineering

BATTERIES

Dry Cells

Tests to Determine Deterioration of Small Dry Cells with Age, A. J. Helfrecht. Elec. Rev. (Chicago), vol. 75, no. 15, Oct. 11, 1919, pp. 603-604, 4 figs. Curves showing variations in performance as cells decreased in size.

Storage Batteries

Large Batteries for Power Purposes, E. C. McKinnon. Jl. Instn. Elec. Engrs., vol. 57, no. 284, July 1919, pp. 493-509 and (discussion) pp. 510-531, 7 figs. Discussing the evolution of large batteries, battery-room design, standardization, high-tension batteries, central station batteries, stand-by batteries, working results, control of large batteries and future aspect relative to large batteries.

ELECTROPHYSICS

Cables

Tables of Maxima Values of Current Intensity in Electrical Conductors of Cables (Tabelle dei valori massimi delle intensità di corrente nei conduttori e cavi elettrici), E. Soleri. Elettrotecnica, vol. 6, no. 27, Sept. 25, 1919, pp. 574-579, 4 figs. Comparative study of permissible values standardized by technical associations in Italy, France, England, Switzerland and Austria.

Current Distribution in Armature Conductors

Current Distribution in Armature Conductors, Waldo V. Lyon. Mass. Inst. Technology, Elec. Eng. Dept., Research Division, no. 19, July 1919, 13 pp., 3 figs. Equations are derived showing how a. c. resistance depends upon depth of slot. Scheme is then proposed for investigating circulations of deep-slot indication motors with high torque.

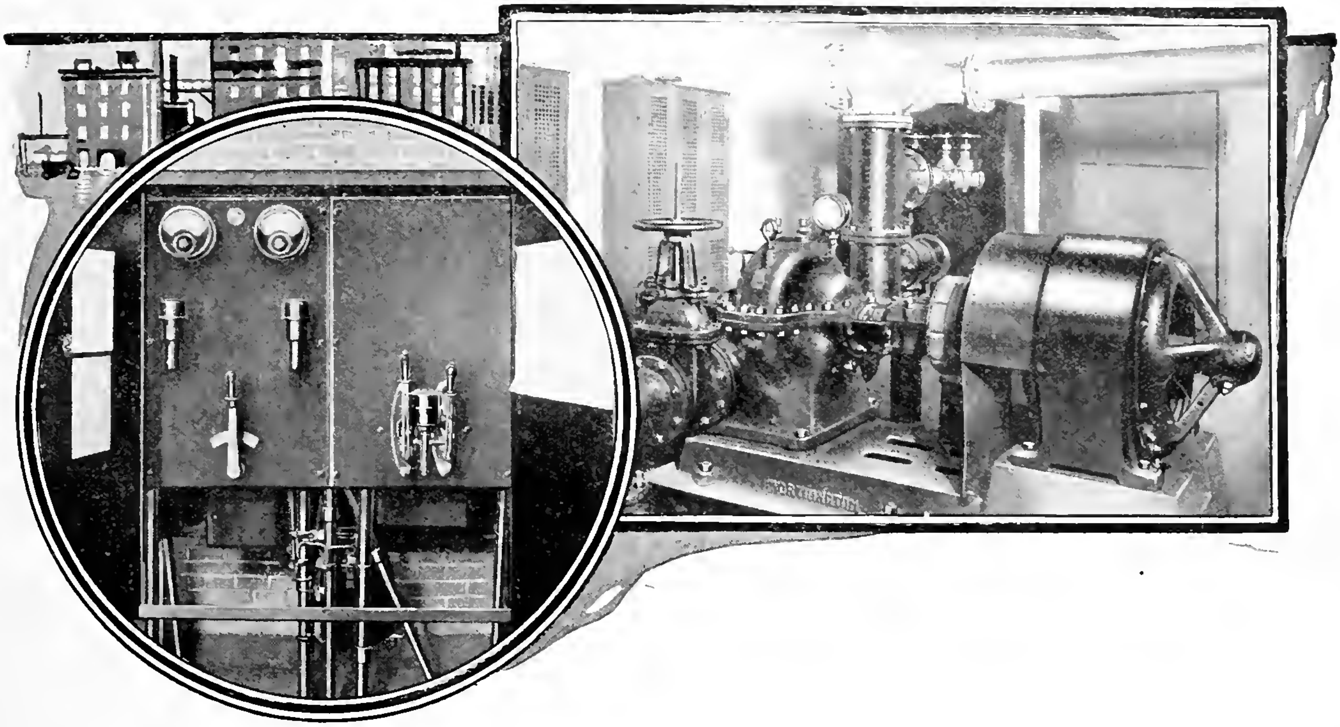
De-Ionization

Determination of Rate of De-Ionisation of Electric Arc Vapor, Henry G. Cordis. Proc. Inst. Radio Engrs., vol. 7, no. 5, Oct. 1919, pp. 527-539, 5 figs. After discussing de-ionization and consequent loss of conductivity of mercury vapor carrying momentary arc, writer considers arrangement of circuits for determining rate of de-ionization, and effect of this rate of voltage required for subsequent reignition. Theory of circuits is given and illustrated by numerical examples.

High-Tension, High-Frequency Apparatus

High Potential, High Frequency Apparatus and Experiments. Jl. Eng. Inst. Can., vol. 11, no. 10, Oct. 1919, pp. 663-668, 10 figs. Experiments were concerned with alternating current of very high frequencies, which consisted of separate groups of alternating currents, each group beginning with same amplitude but damping down more or less rapidly to zero and after short period of time beginning again. General arrangement of apparatus for high-potential high-frequencies experimental cabinet is illustrated.

Fire risk is practically eliminated by electric motor-driven pumps which start when a switch is closed



This Fire Pump Guards Our Factory

ELECTRIC power from either our power plant or from the Philadelphia Gas and Electric Company, with its duplicate stations, generators, and power lines, is used to operate this G-E motor-driven fire pump in our Philadelphia factory if a sprinkler head is opened. This starting up is done quickly, not slowly, as is necessary with steam engine driven pumps.

If the fire-proof cellar in which this pump is located should be flooded the pump would work, as the motor and its control equipment will operate under water.

Many of these G-E motor-driven fire pump installations all over the country are reducing premiums for their owners. May we reduce yours?

General Electric Company

General Office Schenectady, N.Y.

43-258

Inductances

A Note on the Comparison of Inductances, or of an Inductance and a Capacity by an Electrometer Method. Alva W. Smith. Phys. Rev., vol. 14, no. 4, Oct. 1919, pp. 356-360, 3 figs. Equation connecting deflection of electrometer with inductance capacity and current in circuit is developed.

Polarization of Geissler Discharge

Polarisation in the Geissler Discharge (Ueber die Polarisation in der Geisslerentladung), Erich Rumpf. Annalen der Physik, vol. 59, no. 1, June 13, 1919, pp. 1-27, 7 figs. Method which makes it possible to demonstrate polarization, manifesting itself in various ways, similar to electrolytic polarization, in a Geissler tube.

Resistance of Pure Metals

Study on Resistance of pure Metals (Ueber die Abhängigkeit des Widerstandes reiner Metalle von der Temperatur), L. Holborn. Annalen der Physik, vol. 59, no. 2, June 20, 1919, pp. 145-169, 1 fig. Tables and curves showing resistance coefficient of iron, nickel, tungsten, molybdenum, rhodium, aluminum, platinum and others.

Vacuum Valve

The Three-Electrode Thermionic Valve as A. C. Generator, C. L. Fortescue. Elecn., vol. 83, nos. 2157 and 2160, Sept. 19, 1919 and Oct. 10, 1919, pp. 294-295 and 414-416, 9 figs. Also in Elec. Rev. (Lond.), vol. 85, no. 2185, Oct. 10, 1919, pp. 456-457, 9 figs. Work done during war in wireless telegraphy department of English Signal School at Portsmouth. Calculations for determining conditions for maintenance of oscillations. Paper read before British Assn. for Advancement of Sci.

A Method of Using Two Triode Valves in Parallel for Generating Oscillations, W. H. Eccles and F. W. Jordan. Elecn., vol. 83, no. 2157, Sept. 19, 1919, p. 299, 5 figs. In order to obtain more symmetrical oscillations, writers suggest arranging two tubes in such a way that flywheel circuit is acted upon by a triode and high-voltage battery symmetrically in every half period.

X-Rays

Soft X-Rays. H. M. Dadourian. Phys. Rev., vol. 14, no. 3, Sept. 1919, pp. 234-246, 8 figs. Produced by impact of electrons hot lime cathode against platinum anode, using potentials of 20 to 1000 volt.

FURNACES

Duplex Process

Electric Furnace Improves Gray Iron, George K. Elliott. Foundry, vol. 47, no. 330, Sept. 1, 1919, pp. 585-586. Duplex process of melting in cupola and finishing in electric furnace is advocated for certain classes of gray-iron casting where quality is first requisite. Paper read at meeting of Am. Electrochem. Soc.

Heat-Treating Furnaces

Electric Furnaces for Heat Treatment of Steel, Elecn., vol. 83, no. 2158, Sept. 26, 1919, pp. 375-377. It is stated that while electric heating alone cannot compete with cost of gas or coke firing, advantages of control, accuracy, uniformity, absence of distortion and smallness of rejections are so enormous that there is no question that future is with electric furnace.

Steel Furnaces

Electrical Furnaces from a Steel Maker's Point of View, J. W. Naylor. Elecn., vol. 83, no. 2158, Sept. 26, 1919, pp. 363-367, 6 figs. It is observed that electric furnaces served their purpose during war by increasing output, which was of vital importance, but are now being superseded by Siemens, owing to competition, except for steels of superior quality, for which better price can be obtained.

Wild-Barfield Furnace

The Wild-Barfield Electric Furnace. Automobile Engr., vol. 9, no. 130, Sept. 1919, pp. 290-293, 8 figs. Decalescent point is employed for electro-magnetic temperature recording.

GENERATING STATIONS

Canadian Plant

Hydroelectric Plant and Paper Mill at Ocean Falls, B. C., W. A. Scott. Elec. Rev. (Chicago), vol. 75, no. 14, Oct. 4, 1919, pp. 551-574, 7 figs. Featuring Canadian properties of Pacific Mills, Ltd., and electric drive of large paper machines said to be unique.

China

Electrical Enterprise in China. Elec. Times, vol. 56, no. 1460, Oct. 9, 1919, pp. 278-280, 8 figs. Types of electrical stations and sub-stations used.

Denver

New Electric Generating Station at Denver, H. H. Kerr and T. O. Kennedy. Jl. Electricity, vol. 43, no. 7, Oct. 1, 1919, pp. 306-308, 4 figs. Concerning boiler-room equipment, ventilation arrangement and pumping units of 15,000 kw. station.

High D. C. Voltages

New Connection for Producing high D. C. Voltages (Eine neue Schaltung für die Erzeugung hoher Gleichspannungen), M. Schenkel. Elektrotechnische Zeitschrift, vol. 40, no. 28, July 10, 1919, pp. 333-334, 2 figs. Especially designed for testing and scientific purposes. Principal advantage said to be that the required alternating voltage itself need not be high.

Large Stations

Large High-Tension Alternating-Current Electric Stations (Les grands postes électriques à courant alternatif haute tension), A. Ha, et. Revue Générale de l'Electricité, vol. 6, no. 10, Sept. 6, 1919, pp. 299-309, 6 figs. Concerning selection of transformers, connections of network, distances between insulators and earth connections. (Continuation of serial.)

Merz-Price Protection Methods

Merz-Price Protection for Alternators and Transformers, C. W. Marshall. Elec. Rev., London, vol. 85, no. 2181, Sept. 12, 1919, pp. 345-346, 3 figs. System said to be of great value in maintaining continuity of supply.

Power Factor

The Improvement of Power Factor, E. W. Dorey. Electrical Review, vol. 85, no. 2186, Oct. 17, 1919, pp. 484-485, 2 figs. Tables showing effect of speed and load on power factors, based on actual data of motors. (To be continued.)

Rates

Central-Station Rates in Theory and Practice, H. E. Eisenmenger. Elec. Rev. (Chicago), vol. 75, nos. 14, 15, 16 and 17, Oct. 4, 11, 18 and 25, 1919, pp. 555-558, 599-602, 643-648 and 686-690, 19 figs. Oct. 4: Differentiating between classes of service; value of service according to size of customers and use; isolated plants and other competitions in light. Oct. 11: Study of systems of charge in vogue. Oct. 18: Study of stepmeter rate. Oct. 25: Methods for applying lower average kilowatt hour for larger consumers.

Simplon Tunnel

New Installations of Simplon Tunnel (Les nouvelles installations du tunnel du Simplon), Génie Civil, vol. 75, no. 15, Oct. 11, 1919, pp. 337-344, 20 figs. Details of hydro-electric plant at Massaboden, near Brig, Switzerland. (From Schweizerische Bauzeitung.)

GENERATORS AND MOTORS

Asynchronous Motors, Starting

Starting of Asynchronous Motors by Means of Tertiary Eddy Currents, R. Rudenberg. Elecn., vol. 83, no. 2160, Oct. 10, 1919, pp. 422-423, 4 figs. Proposed arrangement where secondary circuit of motor is connected through transformer with tertiary circuit in which considerable resistance is inserted. When at rest, rotor winding receives full frequency of network, so that transformer produces very small effect on current. Translated from Elektrotechnische Zeitschrift.

Bearings, Railway Motor

Railway Motor Bearings, J. S. Dean. Elec. Jl., vol. 16, no. 10, Oct. 1919, pp. 443-446, 18 figs. Method of manufacturing outlined and operations illustrated.

Coolers

New Types of Coolers for Electric Machinery (Neuere Kühleinrichtungen für elektrische Maschinen), Elektrotechnischer Anzeiger, vol. 36, nos. 65, 66 and 73, June 29, July 1 and 17, 1919, pp. 297-298, 303-304, and 339-340, 17 figs. Describing methods and designs for cooling turbo generators, for preventing overheating of commutator and collector rings and fires in air filters and for cooling three-phase motors. (Concluded.)

Gears, Helical

Decreased Operating Costs with Helical Gears, G. M. Eaton. Elec. Jl., vol. 16, no. 10, Oct. 1919, pp. 430-433, 2 figs. Because, it is said, these gears operate under conditions where weight reduction may be effected.

Induction Motor

The Synchronized Induction Motor, F. Keith D'Alton. Elec. News, vol. 28, no. 20, Oct. 15, 1919, pp. 39-41 and 44, 10 figs. Account of tests of standard one horsepower, four-pole squirrel cage motor, made in order to study possibilities of having machine synchronizing itself by modifying rotor.

Parallel Operation

Parallel Running of D. C. Series Motors for Traction Purposes (Das Parallelarbeiten von Gleichstrom-Reihenschlussmaschinen im Bahnbetriebe), Hans Engel. Elektrische Kraftbetriebe und Bahnen, vol. 17, no. 18, June 25, 1919, pp. 137-143, 20 figs. Discussion of problems in trains with direct control, having large number of motors. Systematic investigation of their possible parallel connections.

Rolling-Mill Drives

Motors for Rolling-Mill Table Drives, W. S. Hall. Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, pp. 505-507, 2 figs. Curves and data obtained from existing installations.

LIGHTING AND LAMP MANUFACTURE

Filament Temperature

Temperatures of Incandescent-lamp Filaments, Benj. E. Shackelford. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2265-2269, 6 figs. Relations between temperature, efficiency, lamp size, and life of incandescent lamps, insofar as they effect rating of product and its use by individual consumer.

Flash Lights

Pocket Electric Flash Light Fitted with Mechanical Generator (Lampe électrique de poche à générateur méchanique d'électricité), Industrie Electrique, vol. 28, no. 655, Oct. 10, 1919, pp. 367-369, 3 figs. Armature of magneto is operated by action of lever arranged to be pressed by hand.

Indirect Lighting

Indirect Lighting with Marble Plates (La lumière de marbre), Electricien, vol. 48, no. 1231, Aug. 1, 1914, pp. 65-67, 2 figs. Experiments on transparency of marble plates three to twenty millimeters thick and their use in electric lamps.

Motor-Car Lighting

Powell and Hanmer Electric Lighting Installations. Autocar, vol. 43, no. 1247, Sept. 13, 1919, pp. 423-426, 7 figs. System incorporates mechanical control of dynamo speed, which is said to simplify electrical gear and permit standard practice to be followed.

National Electric Light Association

National Electric Light Association Lighting Exhibit, G. P. Morrison. Gen. Elec. Rev., vol. 22, no. 10, Oct. 1919, pp. 776-782, 13 figs. Exhibit featured recent development in industrial, home, and educational lighting.

A Review of the N. E. L. A. Lamp Committee Report, G. F. Morrison. Gen. Elec. Rev., vol. 22, no. 10, Oct. 1919, pp. 767-775, 8 figs. Statistics and record of progress of incandescent lighting equipment.

Street Lighting

Street Lighting Reconstruction Problems, L. Gaster. Illuminating Engr., vol. 12, no. 8, Aug. 1919, pp. 225-232 and (discussion) pp. 233-236, 5 figs. Remarks based on official data in city of London on street accidents which took place at the time street lighting was diminished during the war.

Street Lighting and Traffic Accidents, Ward Harrison. Elec. Rev. (Chicago), vol. 75, no. 15, Oct. 11, 1919, pp. 605-606, 2 figs. Analysis of year's traffic accidents in Cleveland as to time of day and season shows large percentage due to lack of light. Hence the value of good street lighting is emphasiezd.

Weave-Room Illumination

A Few Examples of Weave-Room Illumination in Textile Mills, Kenneth A. McIntyre. Elec. News, vol. 28, no. 19, Oct. 1, 1919, pp. 43-44, 4 figs. With suggestions in regard to problems of industrial illumination.

MEASUREMENTS AND TESTS

Alternator Tests

Tests of Alternators while Running at Part Load. (Essai à puissance réduite des alternateurs), M. Togna. Revue Générale de l'Electricité, vol. 5, no. 25, June 21, 1919, pp. 875-879, 8 figs. Generalization of uses of flux meter. Sequel to discussion presented by writer in R. G. E., May 31, 1919.

Anemometer

A Hot-wire Anemometer with Thermocouple, T. S. Taylor. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1605-1608, 2 figs. A hot-wire anemometer consisting of small platinum heating wire and having copper-constantan thermocouple attached at its mid point is said to have been found useful in measuring distribution of gas flow across small channels.

Conductivity Measurement

Application of the Thermionic Amplifier to Conductivity Measurements, R. E. Hall and L. H. Adams. Jl. Am. Chem. Soc., vol. 41, no. 10, Oct. 1919, pp. 1515-1525, 4 figs. It is claimed that amplifier used in conjunction with telephone in measurement of resistance on solutions makes much simpler determination of balance position of bridge; electron tube suggested as source of alternating current for conductance measurements because of its cheapness and wide range of frequencies which may be obtained with it.

A Method of Measuring without Electrodes the Conductivity at Various Points along a Glow Discharge and in Flames, Balth. van der Pol. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 225, Sept. 1919, pp. 352-364, 8 figs. Experiments with body placed near free ends of Lecher wires where potential loop occurs. Mathematical theory of phenomena involved is also presented.

Electrometer-Condenser Operation

Operation of the Variable Condenser in Combination with a Quadrant Electrometer (Condensateur variable modifié pour l'emploi avec l'électromètre à quadrants), Harry Clark. Radium, vol. 11, no. 8, June 1919, pp. 235-236, 3 figs. For the purpose of maintaining equal capacity of apparatus throughout experiment.

Electron Tubes

Measurements on Electron Tubes (Ueber Messungen an Elektronenröhren), H. G. Möller, Archiv für Elektrotechnik, vol. 8, no. 1, July 15, 1919, pp. 46-58 21 figs. Describing experimental arrangement of amplifiers sender and audion tubes, as well as measurements made; points which have to be considered in order to avoid errors.

Fault Localization

Some Notes on Fault Localisation, G. W Stubbings. Elec. Rev. (London), vol. 85, no. 2185, Oct. 10, 1919, pp. 452-454. Bridge tests for fault localization on underground cables are believed to have advantage that they are not susceptible to inaccuracies through variation of resistance of fault.

Galvanometers

The Six-String Einthoven Galvanometer, Engineering, vol. 108, no. 2799, Aug 22, 1919, p. 255, 4 figs. Six wires replace coil of moving coil galvanometer. They are stretched in narrow air gap between poles of powerful electromagnet. When a current passes up or down them they are deflected in direction of right angles to magnetic field. Movement is observed with aid of microscope which passes through pole pieces.

Potentiometer

A Rectangular-Component Two-Dimensional Alternating-Current Potentiometer, A. E. Kennelly and Edy Velander. Mass. Inst. Technology, Elec. Eng. Dept., Research Division, no. 18, July 1919. 26 pp., 20 figs. Form developed by Alfred E. Hanson, said to be particularly adapted to telephonic frequency measurements.

New Blondel-Touly Potentiometer Amplifying Devices (Sur de nouveaux dispositifs amplificateurs potentiometriques de Blondel et Touly), A. Blondel. Revue Générale de l'Electricité, vol. 6, no. 14, Oct. 4, 1919, pp. 427-441, 10 figs. Combining two audions connected in cascade and three batteries. Armstrong principle of regeneration is utilized.

Wave, Alternating Measurements

The Measurement of Alternating Waves with the Braum Tube, E. Lübke. Elecn., vol. 83, no. 2156, Sept. 12, 1919, pp. 270-272, 9 figs. Describes inertialess contact maker consisting of ionization of a gas by means of cathode rays, for purpose of delineating oscillatory curves by Joubert method. Arrangement of special double Braun tube, using glowing cathode and steady voltage of 220, said to lend itself to measurement of high-frequency fields on account of very small current requirements. From Archiv fur Elektrotechnik.

MATERIALS OF CONSTRUCTION

Commutators

The Making of Commutators, W. F. Sutherland, Power House, vol. 12, no. 14, Sept. 5, 1919, pp. 387-389, 8 figs. Materials of construction and mechanical details. First article.

Insulators

Deterioration of High-Tension Insulators (Zerstorungserscheinungen an Hochspannungsisolatoren), E. O. Meyer. Elektrotechnische Zeitschrift, vol. 40, nos. 16, 18 and 24, Apr. 17, May 1 and June 12, 1919, pp. 173-176, 198-200 and 278-282, 31 figs. Effect of thermic influences on insulating material.

POWER APPLICATION

Blast-Furnace Plants

Electrical Practice in the Equipment of Blast-Furnace Plant, J. Percy Hodges. Elecn., vol. 83, no. 2158, Sept. 26, 1919, pp. 333-338, 9 figs. Including uses of capstans, transfer and telpher cars, hoists and overhead travelling cranes equipped with electro-magnets for clearing pig beds.

Docks

Electrical Control of the Sluices and Lock Gates of the Floating Dock at Boulogne (La commande électrique des vannes et des portes de l'écluse à cas du bassin à flot du port de Boulogne), A. Foillard. Génie Civil, vol. 75, no. 15, Oct. 11, 1919, pp. 348-361, 9 figs. Schematic arrangement and details of winches.

Domestic Uses

Notes on the Application of Electricity to Domestic Services, J. H. Dobson, H. A. Tinson and R. H. Gould. Trans. South African Inst. Elec. Engrs., vol. 10, no. 8, Aug. 1919, pp. 114-120 and (discussion) pp. 120-123. Tests on economical value of application of electricity to domestic uses, carried out at laboratory of Johannesburg Elec. Supply Dept.

Drives, Electric

Outline Status of Electric Drive, Wilfred Sykes. Iron Trade Rev., vol. 65, no. 18, Oct. 30, 1919, pp. 1184-1185, 1 fig. It is noted that development of electrically-driven reversing rolling mills has been rapid and that reversing motor has been used economically on all types of mills. Paper read before Am. Iron & Steel Inst.

Magnets, Lifting

Developments in Lifting Magnet Practice, F. N. Pickett. Elecn., vol. 83, no. 2158, Sept. 26, 1919, pp. 349-352, 7 figs. Illustrating uses and various applications including handling of pig-iron steel rails and plates.

Mill Auxiliaries

The Electric Control of Steel-Mill Auxiliaries, C. Howard. Elecn., vol. 83, no. 2158, Sept. 26, 1919, pp. 339-348, 15 figs. Automatic control as against hand control is considered particularly advantageous in steel works; with regard to types of control writer gives details of four classes.

Mills, Reversing

The Future of the Electrical Equipment of Small Reversing Mills, L. Rothera. Elecn., vol. 83, no. 2158, Sept. 26, 1919, pp. 368-369, 3 figs. It appears to writer that at present capabilities and advantages of small reversing mill plant have not been fully grasped by manufacturers, but he anticipates that, with increasing necessity for large output and reduction in operating cost, future will see wide extension of electrical reversing drive for small mills.

Rolling Mills

The Electrical Driving of Rolling Mills, A. P. Pyne. Elecn., vol. 83, no 2158, Sept. 26, 1919, pp. 324-332, 18 figs. Most suitable type of motor to fulfill given requirements is considered; also conditions under which rope or gear drives should be adopted.

See also Mills, Reversing.

Tools, Portable

Portable Electric Tools, E. Preston. Eng. & Indus. Management, vol. 2, no. 16, Oct. 16, 1919, pp. 486-487, 2 figs. Development in Great Britain during the war, notably in electric drills and hammers for riveting.

STANDARDS

Voltage Standardization

Voltage Standardization in Switzerland—V (Zur Frage der Vereinheitlichung der Betriebsspannungen in der Schweiz). Bul. Assn. Suisse des Electriciens, vol. 10, no. 8, Aug. 1919, pp. 215-232. Advantages and difficulties of introducing higher voltage as standard; its relation to cost of manufacture of incandescent lamps and motors, cable lines and installations for domestic purposes.

TELEGRAPHY AND TELEPHONY

Amplifiers

High-Vacuum Amplifiers—I and II (Ueber Hochvakuumverstärker), W. Schottky. Archiv der Elektrotechnik, vol. 8, no. 1, July 15, 1919, pp. 1-31, 10 figs. Constructional details.

Application of Amplifiers to the Mechanical Inscription of Wireless Signals (Application des amplificateurs à l'inscription mécanique des signaux de télégraphie sans fil), Henri Abraham and Eugène Bloch. Revue Générale de l'Electricité, vol. 6, no. 11, Sept. 13, 1919, pp. 323-324. Describing method of inscribing wireless signals by aid of amplifiers without employing mechanical relay.

See also Vacuum Tubes.

Antennæ

Radiation of the Antenna (Die Strahlung von Antennen-systemen). Max Abraham. Jahrbuch der drahtlosen Telegraphie und Telephonie, vol. 14, no. 2, July 1919, pp. 146-152. Points to theory of electromagnetic field as basis of wireless telegraphy since it determines radiation and thereby efficiency of system.

Airplane Antenna Constants, J. M. Cork. Dept. Commerce, Sci. Papers of Bur. of Standards, vol. 15, no. 341, Sept. 14, 1919, pp. 199-213, 12 figs. Measurements of effective capacity, effective resistance, true capacity, true inductance, and wave length, and study of directional effect of various types of airplane antennæ.

Cables, Telephone

Engineering Problems Involved in the Use of Telephone Cables. Jl. Eng. Inst. Can., vol. 11, no. 10, Oct. 1919, pp. 669-671. Concerning mechanical details of construction required by reason of electric phenomena taking place between wire in cable.

Cathode-Ray Tube

Applications of the Cathode-Ray Tube in Radio Work, L. E. Whittemore and L. M. Hull. Phys. Rev., vol. 14, no. 3, Sept. 1919, pp. 266-267, 1 fig. Tube using platinum filament coated with mixture of calcium and barium oxides said to have proven successful in work undertaken by Bureau of Standards.

Direction Finder

An Electrostatic Direction Finder, E. Bellini. Elecn., vol. 83, no. 2156, Sept. 12, 1919, pp. 273-275, 13 figs. Describing new radiogoniometer utilizing electrostatic coupling between aerials and apparatus for detecting or generating oscillations.

Eilvese Radio Station

Radio Station at Eilvese (Hanover), (Radio-Grosstation Eilvese, Hanover), Aage S. M. Sörensen. Elektrotechnische Zeitschrift, vol. 40, no. 21, May 22, 1919, pp. 233-234, 4 figs. Detailed description of high frequency apparatus, antenna, operation and efficiency of Eilvese station.

Interference

Influence of Railroad Electrification on Telephone Lines, Fred W. Scholz. Telephone Engr., vol. 22, no. 4, Oct. 1919, pp. 37-40, 3 figs. Technical study of electric field in interior of telephone cable as affected by an electric traction line. Translated from Annales des Telegraphes et Telephones.

Multiple Telephony and Telegraphy

Multiple Telephony and Telegraphy by Means of High-Speed Alternating Currents (Mehrfach-Telephonie und Telegraphie mit schnellen Wechselströmen), Karl Willy Wagner. Telegraphen-und Fernsprech-Technik, vol. 8, no. 3, June 1919, pp. 29-35, 11 figs. Historical account; damping of high-speed a. c. in overhead lines and cables; experiments with multiple telephony; future of new method.

Receiver Circuits

On the Theory of Radiotelegraphic and Radiotelephonic Receiver Circuits, J. F. J. Bethenod. Proc. Inst. Radio Engrs., vol. 7, no. 5, Oct. 1919, pp. 517-525, 3 figs. Proceeding

from theory of approximate rectifying detector, most advantageous proportioning of constants of secondary circuits of receiver is obtained. Constants of most desirable telephone winding and value of most suitable telephone shunting condenser are then derived.

Receivers, Air

The Uni-Control Receiver, Roy E. Thompson. Proc. Inst. Radio Engrs., vol. 7, no. 5, Oct. 1919, pp. 499-511 and (discussion) pp. 515-516. Design and construction of air receiver operating efficiently and selectively over a long range of wave lengths of antenna of ordinary dimensions, and controlled by single handle, are described, and possibilities of such a receiver for solution of interference problems are discussed. Addition of motor for driving wave changing adjustment continuously is shown.

Telegraphy, Wireless

Wireless in the A. E. F., L. R. Krumm and Willis H. Taylor. Wireless Age, vol. 7, no. 1, Oct. 1919, pp. 9-21, 26 figs. Account of organization of radio division of signal corps with remarks on obstacles which Americans had to overcome.

Telephone, Hot-Wire

The Hot-Wire Telephone. Telephone Eng., vol. 22, no. 4, Oct. 1919, pp. 35-36, 1 fig. Form used for range finding in war.

Telephones, Los Angeles

Los Angeles Manual-Automatic Unification, D. E. Wiseman. Telephone Engr., vol. 22, no. 4, Oct. 1919, pp. 19-24, 10 figs. Plans for physical consolidation of Bell manual and automatic electric telephone systems which previously to June 1, 1918, operated as separate systems. Under new system each subscriber has access to every other subscriber and to all long-distance lines center in district. Paper presented at Section Meeting of A. I. E. E. at San Francisco.

Telephony, Radio

Radio Telephony, E. H. Colpitts. Jl. Soc. Automotive Engrs., vol. 5, no. 3, Sept. 1919, pp. 212-218, 11 figs. Historical review of experimental work and description of apparatus available at present.

Thermionic Valve

See Electrophysics.

Trigger Relay

A Trigger Relay Utilising Three-Electrode Thermionic Vacuum Tubes, W. H. Eccles and F. W. Jordan. Elecn., vol. 83, no. 2157, Sept. 19, 1919, p. 298, 2 figs. Describing what may be called a one-stroke relay which, when operated by a small triggering electrical impulse, undergoes great changes in regard to its electrical equilibrium and then remains in the new condition until re-set. Paper read before British Association.

Tube Transmitters

Tube Transmitter (Ueber Rohrensender), A. Meissner. Jahrbuch der drahtlosen Telegraphie und Telephonie, vol. 14, no. 1, May 1919, pp. 5-26, 22 figs. Experiments said to have shown that efficiency increases as grid voltage decreases; however, at the same time the power too is somewhat reduced.

Vacuum Tubes

Vacuum Tubes as Amplifiers and Vibration Producers (Vakuumrohren als Verstarker und Schwingungserzeuger), K. Mühlbrett. Archiv der Elektrotechnik, vol. 8, no. 1, July 15, 1919, pp. 32-42, 8 figs. Experimental investigation of tubes.

High-Vacuum Tube with One Electrode (Die Hochvakuum-Eingitterrohre), H. Rukop. Jahrbuch der drahtlosen Telegraphie und Telephonie, vol. 14, no. 2, July 1919, pp. 110-146, 15 figs. Constants of one-electrode tube; the tube as amplifier; the tube as vibration producer; inner resistance of tube, relations between efficiency and inner and outer resistance.

See also Amplifiers.

Vacuum-Tube Circuit

Some Modern Vacuum-Tube Circuits and Their Operation, J. Scott-Taggart. Wireless Age, vol. 7, no. 1, Oct. 1919, pp. 25-27, 4 figs. "Stand-by" and "tuned" continuous-wave receiver, and continuous-wave transmitter.

TRANSFORMERS, CONVERTERS, FREQUENCY CHANGERS

Fires in Transformers

Fires in Oil Transformers (Oel-Transformatorenbrande), Willibald Fuhrmann. Elektrotechnischer Anzeiger, vol. 36, no. 71, July 13, 1919, pp. 329-330. To prevent such fires writer recommends contact thermometer, to be connected with maximum automat in the case of unguarded stations; also fuses of metals having low melting point such as tin, lead or bismuth.

Heating of Transformers

The Heating Problem in Dry Transformers (Das Erwarmungsproblem des Trockentransformators), Milan Vidmar. Elektrotecanische Zeitschrift, vol. 40, no. 15, Apr. 10, 1919, pp. 164-167, 5 figs. Discussing inner and outer heat currents, surface heat of coils. Comparison of vertical and horizontal column transformers.

Rectifiers, Mercury-Vapor Arc

Shape of Curve of Current and Tension in Mercury Vapor Arc Rectifiers for Single-Phase Alternating Current (Ueber die Kurvenform des Stromes und der Spannungen an Quecksilberdampf-Gleichrichtern für Einphasen-Wechselstrom), Hans Nielsen. Elektrotechnische Zeitschrift, vol. 40, no. 20, May 15, 1919, pp. 224-227, 3 figs. Special formulæ for rectifiers without a. c. choking coil. Method is shown for simplified calculation of approximate size of a. c. choking coil.

Tank for Static Transformers

A New Form of Tank for Static Transformers, W. S. Moody. Gen. Elec. Rev., vol. 22, no. 10, Oct. 1919, pp. 756-759, 9 figs. Also in Elec. Rev., vol. 75, no. 16, Oct. 18, 1919, pp. 651-653, 7 figs. How conservator type reduces to minimum possibility of moisture entering, removes any combustible gases as soon as formed, and prevents hot oil from coming into contact with air.

Transformers, Limiting Sizes

Large Power Transformers, A. G. Ellis and J. L. Thompson. Elecn., vol. 83, nos. 2156 and 2157, Sept. 12 and 19, 1919, pp. 276-278 and 296-298, 6 figs. Limiting sizes of transformers as effected by handling and cooling are discussed, and prices per kilovolt-ampere in relation to output, voltage and cooling are presented. Conditions affecting choice of types and relative advantages of shell and core transformers are dealt with. (To be concluded.)

Transformer, Special

Special Transformer Delivers Arc Voltage, C. J. Holslag. Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, pp. 487-488, 4 figs. Electric Arc Cutting Welding Company portable machine weighing 260 lb. Voltage increase accompanied by corresponding ampere decrease keep heat automatically constant.

TRANSMISSION, DISTRIBUTION, CONTROL

Benzinoform in High Tension Switches

Benzinoform in High-Tension Oil-Break Switches, M. Vogelsang. Sci. Am. Supp., vol. 88, no. 2282, Sept. 27, 1919, pp. 194-195. Some recently revealed German experiences with substitute materials. From Elektrotechnische Zeitschrift.

Cable-Fault Location

New Method for Locating Cable Faults (Ein neues Verfahren zum Auffinden von Kabelfehlern), Erwin Wurmbach. Elektrotechnische Zeitschrift, vol. 40, no. 19, May 8, 1919, pp. 211-212, 2 figs. Method consists in observing direction of a d. c. artificially sent through a cable armature by means of very sensitive instrument located at opposite ends of place where trouble occurs.

Conductor Supports

Generating and Sub-Station Conductor Supports, J. P. Collopy. Power Plant Eng., vol. 23, no. 19, Oct. 1, 1919, pp. 868-869, 5 figs. Types and methods utilized to insure safety and continuity of service.

High-Tension Networks

High Tension Alternating Current Underground and Over Head Network (Canalisations souterraines et aériennes à haute tension à courant alternatif), W. Kummer. Revue Générale de l'Electricité, vol. 6, no. 13, Sept. 27, 1919, pp. 115-117, 2 figs. Curves showing diameter of conductor in terms of tension by reference to lead shell; also characteristic curves of underground cable of 100 mm. total diameter having only one conductor of 36 mm. diameter. From Schweizerische Bauzeitung.

Overload Control

Preventing Overloads on Steel-Mill Motors, P. M. Lincoln. Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, pp. 496-497, 3 figs. Description of ammeter depending on temperature for its indications and having the same mass-ventilation ratio as mill motor to be protected against overload. Paper read before Assn. of Iron & Steel Elec. Engrs.

Electric-Machinery Control. Engineering, vol. 108, no. 2800, Aug. 29, 1919, pp. 274-276, 3 figs. Types built by Igranic Elec. Co., Lond., notably magnetic lock-out "clapper" switch, chief feature of which is that two independent magnetic circuit coils are provided, a central big coil for operating switch and a lower boxed in coil for effecting lock-out.

Overload Protection

Influence of Characteristics of Overload Release on the Overload Protection of entire Systems (Ueber den Einfluss der Charakteristik von Ueberstromauslosern auf den Ueberstromschutz ganzer Netze), Georg Gorman. Elektrotechnische Zeitschrift, vol. 40, no. 25, June 19, 1919, pp. 297-299, 12 figs. Detailed discussion of characteristics and possible characteristics of overload releases. Deductions are made for the interconnection of several systems.

Poles

Method of Calculating the Class and Number of Poles required for Telegraph and Telephone Lines, Stanley Rhoads. Telegraph & Telephone Age, vol. 37, no. 19, Oct. 1, 1919, pp. 478-483. Method of calculating applies to straight away ("tangent") pole lines. Corners and terminals are special cases. Storm guys are assumed to strengthen and stiffen only pole to which attached and are designed to prevent swaying of line; line is designed with desired factor of safety without them.

Reinforced Concrete Bases for Poles. Telephone Engr., vol. 22, no. 4, Oct. 1919, pp. 13-14, 4 figs. Structure comprises ordinary wood on pole or shaft concrete base and iron socket for union between base and shaft.

Substations

Outdoor Substations in Connection with Coal-mining Installations, H. W. Young. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1883-1894, 9 figs. Instances illustrating recent developments in design.

Outdoor Substations in Connection with Coal-Mining Installations, H. W. Young. Elec. Rev. (Chicago), vol. 75, no. 15, Oct. 11, 1919, pp. 595-598, 6 figs. General requirements and station design, with notes on high-tension current control.

Transmission Line Calculation

Practical Calculations of Electric Transmission Lines (Calcul pratique des lignes de transmission de l'énergie électrique), Revue Générale de l'Electricité, vol. 6, no. 13, Sept. 27, 1919, pp. 395-400, 1 figs. Formulæ for selection of most economical tension. Third article. Preceding articles appeared in R. G. E., Apr. 7 and Nov. 10, 1917.

Transmission Line Capacity

Methods of Increasing Capacity of Existing Tranmission Lines, E. C. Stone. Elec. Rev. (Chicago), vol. 75, no. 14, Oct. 4, 1919, pp. 562-566, 5 figs. Discussing line limitations and determination of relative costs of increasing capacity. Paper read before Pennsylvania Assn.

Transmission Line, High Tension

High-Tension Lines- II (Hochspannungsleitungen), W. Petersen. Elektrotechnische Zeitschrift, vol. 40, no. 14, Apr. 3, 1919, pp. 152-156, 13 figs. Comparison of various types; influence of temperature; excess voltage and influence of temperature; excess voltage and grounding. (Concluded.)

VARIA

Electromagnet, Plunger

On the Preliminary Calculation of the Characteristics of an A. C. Plunger Electromagnet, N. Hanada (in Japanese). Denki Gakkwai Zasshi, no. 374, Sept. 10, 1919.

See also Solenoids.

Japan

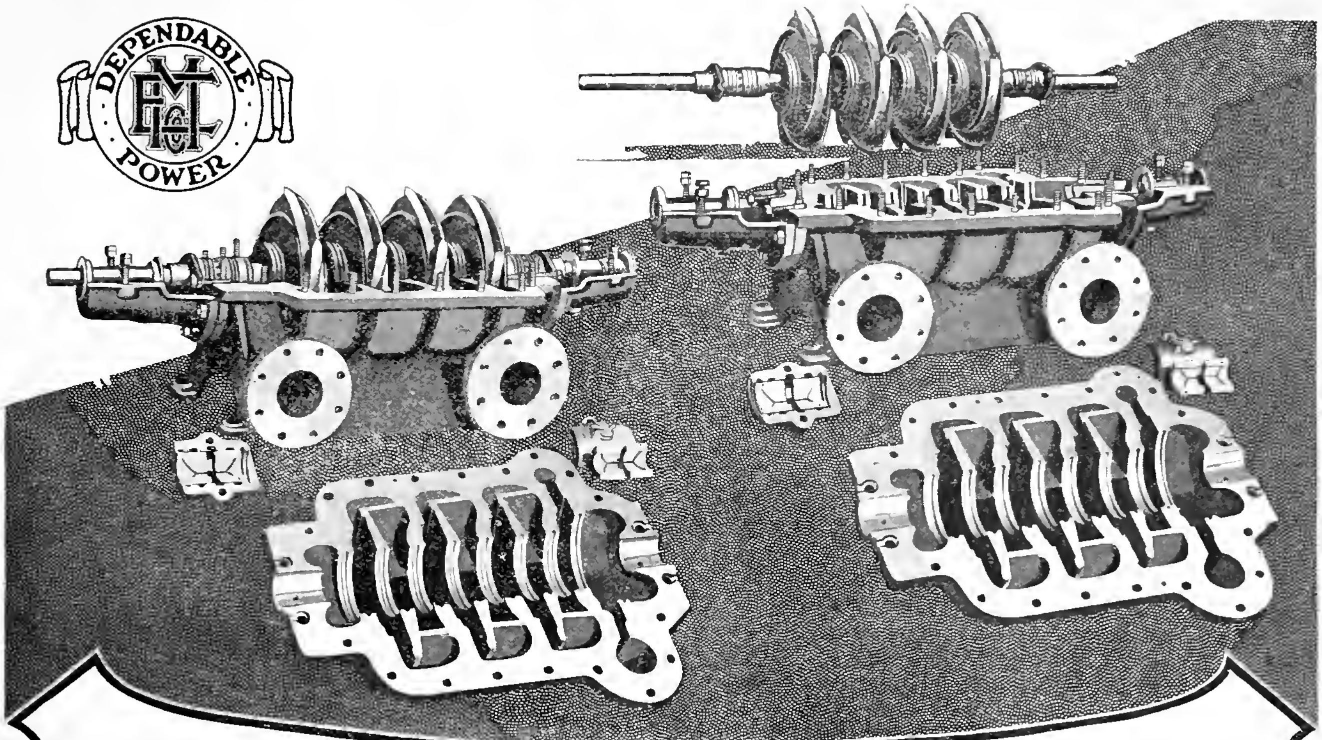
Statistical Report of Electric Undertakings in Japan. Direction General of Electric Exploitations, Dept. of Communications, Tokyo, Japan, June 1919, 20 pp. Summary of statistics showing conditions of existing electric undertakings in Japan at end of 1917, except in Formosa, Corea, Saghalin and Kwantung.

Shock, Electric

How to treat Persons suffering from Electric Shock (Secours aux personnes frappées par le courant électrique). Electricien, vol. 48, no. 1231, Aug. 1, 1919, pp. 73-75, 2 figs. Apparatus for producing artificial respiration.

Solenoids

On the Solenoid with Rectangular Cross Section, Y. Niva (in Japanese). Denki Gakkwai Zasshi, no. 374, Sept. 10, 1919.



MIDWEST
Dependable Power

Absolutely interchangeable parts are an assured feature of the Midwest boiler-feed pumps shown here. This is made possible by the skillful workmanship and the extreme accuracy of construction.

Rotating elements are readily accessible, and the entire pump is exceedingly simple, rugged and dependable.

The particular equipment illustrated is the 4-inch, 4 stage, horizontally split pump of the diffuser type. It operates under the following conditions:

350	G.P.M.	63% Efi.
1700	R.P.M.	180 lbs. Boiler Pressure

There is a Midwest Boiler-Feed pump to fit every operating condition, driven either by motor or by Midwest-Wait type steam turbines.

For detailed information see the Midwest representative in your nearest large city.

Civil Engineering

BRIDGES

Bear River Bridge

The Construction of the Bear River Bridge. Jl. Eng. Inst. Can., vol. 11, no. 10, Oct. 1919, pp. 658-662, 5 figs. It consists of thirteen spans, varying in length from 50 ft. to 156 ft., carried on concrete piers resting on pile foundations with exception of 3 piers which rest on bed of coarse gravel and boulders.

Headgates with Bridge

Headgates Combined with Bridge over Aqueduct Canal. Eng. News-Rec., vol. 83, no. 13, Sept. 25, 1919, pp. 610-611, 5 figs. Heavy reinforced-concrete structure in three spans with stoney gates closing waterways 57 ft. wide and 17 ft. high.

Load Concentration, Wood-Floor Bridge

Load Concentrations on Steel Floor-Joists of Wood Floor Highway Bridges. Eng. & Contracting, vol. 52, no. 17, Oct. 22, 1919, pp. 466-467, 5 figs. Results of investigation made by Iowa State College of Agriculture and Mechanic Arts to determine manner in which heavy wheel loads such as those of traction engines are distributed to the various I-beams and channel joists in a highway bridge floor system consisting of I-beams and channel joists and wood planking.

Pontoons

Concrete Pontoons in the Panama Canal Zone. Shipbuilding & Shipping Rec., vol. 14, no. 13, Sept. 25, 1919, pp. 347-348, 5 figs. General arrangement and particulars of four reinforced concrete pontoons for supporting gangways at Balboa.

Spans, Best Number

Economic Comparison of Engineering Projects—I, George Higgins. Commonwealth Engr., vol. 6, no. 11, June 1, 1919, pp. 344-346, 3 figs. Illustrated in problem of determining best number of spans for a viaduct of given length and height, assuming financial conditions to be the only ones that influence decision.

BUILDING AND CONSTRUCTION

Churches

St. Augustine's Church. Contract Rec., vol. 33, no. 43, Oct. 22, 1919, pp. 982-983, 1 fig. Foundations are to be of concrete and exterior of rubble course stone backed with 8-in. brick and 4-in. terra cotta with Montreal limestone trimmings.

Cost-Plus-Fee Contract

Building Construction Under the Cost-Plus-Fixed-Fee Contract, A. E. Wells. Heat. & Vent. Mag., vol. 16, no. 10, Oct. 1919, pp. 27-29. Coöperation among owner, architect and builder said to be insured by this form of building contract.

Gypsum Plant

Planning Construction of Gypsum Plants, Curtis F. Columbia. Cement, Mill & Quarry, vol. 15, no. 6, Sept. 20, 1919, pp. 21-24, 5 figs. Brief discussion of various types of buildings which comprise usual large gypsum plant, including power plant, water supply, fireproofing and heating and ventilation.

Machinery in Buildings

Critical Speeds of Machinery Placed on Upper Floors of Buildings, as related to Vibration, A. B. Eason. Lond., Edinburgh and Dublin Phil. Mag., vol. 38, no. 225, Sept. 1919, pp. 395-402, 4 figs. Analytical discussion of system consisting of motor resting upon elastic supports upon floor capable of deflection.

Pile Renewal in Trestles

Renewing Piles in Timber Trestles, Geo. W. Rear. Ry. Maintenance Engr., vol. 15, no. 10, Oct. 1919, pp. 340-341, 1 fig. Discussing diversity in character of equipment, organization of crews and methods of doing work.

Roofing

Proper Methods of Applying Roofing on a Gypsum Roof Deck, Curtis F. Columbia. Eng. & Contracting, vol. 52, no. 17, Oct. 22, 1919, pp. 457-459, 7 figs. Comparative advantages of "poured roof" and "precast tile."

CEMENT AND CONCRETE

Adherence of Concrete to Steel

Research on Adherence of Concrete to Steel in Reinforced Concrete Structure (Recherches sur l'adhérence du béton aux armatures dans les constructions en béton armé), M. Mercier. Annales des Ponts et Chaussées, vol. 50, no. 3, May and June 1919, pp. 370-374, 2 figs. It is concluded that adherence is due to special property of cement. Concrete used was made of 300 kg. of portland cement, 400 l. of sand and 800 l. of gravel. After ninety days it showed adherence of 6.5 kg. per sq. cm.

Beams

Concrete Arched Beams and Open Girder Carry Roof of Toronto Theatre. Contract Rec., vol. 33, no. 42, Oct. 15, 1919, pp. 953-954, 4 figs. Roof and balcony are built in reinforced concrete on Hennebique system.

Burnt Earth Concrete

Burnt Earth Concrete with Iron and Wood Reinforcement, L. P. Hodge. Engineering, vol. 108, no. 2801, Sept. 5, 1919, pp. 302-304, 10 figs. Tests of burnt earth concrete beams lead to conclusion that well burnt earth can be substituted for stone in concrete with safety and advantage when cost of stone is prohibitive.

Cold-Weather Concreting

Concreting in Cold Weather Offers Strong Advantages to Owners, A. E. Wells. Can. Engr., vol. 37, no. 17, Oct. 23, 1919, pp. 411-412. Outline of plant layout for winter.

Concrete Roofing Tile

Manufacture of Large Concrete Roofing Tile. Concrete, vol. 15, no. 4, Oct. 1919, pp. 157-159, 9 figs. Method of manufacturing slabs for roof purposes, pitched interlocking tile, flat slabs and channel slab.

Concrete Storage

Warehouse for Concrete and Lime Storage. Concrete, vol. 15, no. 4, Oct. 1919, pp. 154-156, 5 figs. Plan and construction details of structure built for Superior Sand & Gravel Co., Detroit.

Electrolysis

Electrolysis in Concrete, E. B. Rosa, Burton McCollum and O. S. Peters. Tech Papers Bur. Stand., no. 18, Aug. 1, 1919, 141 pp., 31 figs. Laboratory and field investigations relating to nature and cause of phenomena produced by passage of electric currents through concrete, undertaken with view to establish probable extent of danger in practice and circumstances under which trouble is most likely to occur. Specific recommendations are offered in regard to mitigating trouble from this source.

Graphic Tables

Graphic Table for Dimensioning of Reinforced Concrete Slabs for n=20 (Graphische Tabelle zur Dimensionierung einfach armierter Eisenbeton-Platten für n=20), R. Forter. Schweizerische Bauzeitung, vol. 74, no. 9, Aug. 30, 1919, pp. 105-107, 1 fig. Table devised for dimensioning or testing reinforced concrete slabs, eliminating all formulæ.

Gunite

Guniting Piling, Harry B. Sewall. Stone & Webster Jl., vol. 25, no. 4, Oct. 1919, pp. 292-294, 14 figs. on 7 supp. plates. Illustrating work of guniting piling of water front trestle on Bellingham Division of Puget Sound Traction, Light and Power Co.

Naval Construction

Properties of Reinforced Concrete Used in Naval Constructions (Les propriétés du béton armé employé dans les constructions navales), M. Poncet. Génie Civil, vol. 75, no. 1936, Sept. 20, 1919, pp. 266-271, 15 figs. Experiments to determine imperviousness to water and petroleum of concrete, both alone and after being painted with various preparations.

Permeability

Permeability of Concrete, S. Bowman. Jl. Soc. Chem. Indus., vol. 38, no. 17, Sept. 15, 1919, pp. 325R-327R, 1 fig. Method of investigating (1) comparative merits of various waterproofing agents, (2) effect of such compounds on chemical and physical properties of Portland cement and reinforced concrete, and (3) economic aspect of use of such compounds.

Scottish Mode for Measuring Concrete

The Scottish Mode for Measuring Concrete. Contract Rec., vol. 33, no. 42, Oct. 15, 1919, pp. 962-965. Rules applying to taking off of quantities. Established as part of National Building Code of Scotland.

Slag Aggregates

Slag Aggregates in Concrete and Mortar, Emmanuel Mavaut. Iron & Steel of Can., vol. 11, no. 9, Oct. 1919, pp. 232-235, 5 figs. Report of comparative tests of basic steel, slag, limestone and banc rouge used as coarse aggregates in concrete, also basic steel slag screenings, commercial and standard sands used as fine aggregates.

Wood Reinforcement for Concrete

Wood as Reinforcement for Concrete. Eng. & Contracting, vol. 52, no. 18, Oct. 29, 1919, p. 505, 2 figs. Table showing relative strength of beams of wood, wood concrete and reinforced concrete. (From Beton und Eisen.)

EARTHWORK, ROCK EXCAVATION, ETC.

Concrete Block Tunnel

Concrete Block Tunnel at River Rouge, Michigan. Bulletin of Genrl. Contractors Assn., vol. 10, no. 8, Aug. 1919, pp. 148-149, 2 figs. O'Rourke interlocking concrete blocks, 18 in. in thickness, used.

Hydraulic Fill Dams

Methods of Constructing Hydraulic Fill Dams of Miami Conservancy District. Eng. & Contracting, vol. 52, no. 16, Oct. 15, 1919, pp. 432-435, 6 figs. Noting specially stream control and features of retarding basin dams. Paper read before New England Waterworks Assn.

Pipe Lines, Underground

A New Method of Installing Underground Pipe Lines, John C. White. Wisconsin Engr., vol. 24, no. 1, Oct. 1919, pp. 12-15, 5 figs. Worked out by Dept. of Eng. of State of Wisconsin.

Safety Measures

Safety Measures in Excavating Operations. Contract Rec., vol. 33, no. 40, Oct. 1, 1919, pp. 927-928. Precautionary steps for prevention of accidents in excavation work and proper methods of handling equipment.

Tunnels

Some Tunnels in India. Ry. Engr., vol. 40, no. 477, Oct. 1919, pp. 212-216, 10 figs. Constructional details of tunnel 5704 ft. long. (Continuation of serial.)

HARBORS

Turning Basin

Turning Basin and Ship Channel in Toronto's New Industrial Area. Contract Rec., vol. 33, no. 43, Oct. 22, 1919, pp. 975-978, 5 figs. Improvements to Toronto Harbor include provision of a water frontage for industrial sites. Walls of basin and channel were built of concrete on piles, site having been exposed by sand-fill cofferdam.

RECLAMATION AND IRRIGATION

Drainage, Electric

Electric Drainage in Holland (Electrische Bemalingsinrichting voor het Boezemwaterschap Electra), Ingenieur, vol. 34, no. 31, Aug. 2, 1919, pp. 570-571. How district is drained by three stork screw-propeller pumps each having capacity of 209,000 gal. per min. Pumps are driven by 2000-volt three-phase 550-hp. motors.

Irrigation, Cost

Cost of Engineering Work for Maintenance and Operation of large Irrigation Project, H. M. Chadwick. Eng. & Contracting, vol. 52, no. 15, Oct. 8, 1919, pp. 418-419, 2 figs. Engineering order system evolved, operating Valier project, which permitted each job to be covered by an engineering order showing number, canal, reservoir, structure or land involved, class of work and information regarding necessity of survey.

South Africa

Union Irrigation Works and Projects—IV. South African Jl. Industries, vol. 2, no. 7, July 1919, pp. 663-672, 1 fig. Unper Modder River Conservation Scheme; details of catchment area, dam and reservoir site; geological description of site. (Concluded.)

ROADS AND PAVEMENTS

Aggregate Field Testing

Testing Aggregates in the Field, F. H. Jackson. Public Roads, U. S. Dept. Agriculture, Bur. Public Roads, vol. 2, no. 15, July 1919, pp. 11-13. Outfit developed by Bur. of Public Roads, for making field analysis of aggregates, together with suggested methods for its use.

Asphalt Macadam Pavements

Recommended Procedure in the Design, Construction and Maintenance of Asphalt Macadam Pavements, Prevost Hubbard. Mun. & County Eng., vol. 57, no. 4, Oct. 1919, pp. 152-156. Calls emphasis especially to importance of attending to details, that is, following rule of constructing "asphalt macadam by square yard and not by the mile."

Bitoslag Pavements

Characteristics of Bitoslag Pavement, J. R. Draney. Mun. & County Eng., vol. 57, no. 4, Oct. 1919, pp. 156-157. Bitoslag is pavement composed of specially prepared asphalt and finely crushed slag combined with filler and mixed in regular asphalt paving plants. It is laid to depth of not less than 2 in. in thickness after compression.

Brick Pavements

Resurfacing Old Brick Pavement. Mun. Jl. & Public Works, vol. 47, no. 13, Sept. 27, 1919, pp. 196-198, 3 figs. Method of preparing old pavement for new surface; handling traffic during construction.

Contract Awards

Should Contracts for grading upon extensive Highway Improvements be awarded separately? Eng. & Contracting, vol. 52, no. 14, Oct. 1, 1919, pp. 389-390.

Curvature, Continuous in Roads

Design of Roads with Continuous Curvature (Tracés de routes à courbure continue), Ch. Galatoire-Malegarie. Annales des Ponts et Chaussées, vol. 50, no. 3, May and June 1919, pp. 332-362, 13 figs. By continuous curvature is meant smoothed-out curve when radii of components are less than 30 m. How to do this by Bernoulli's lemniscate is shown in article.

Foundations

The Construction of Portland Cement Concrete Pavement Foundations, James W. Routh. Mun. & County Eng., vol. 57, no. 4, Oct. 1919, pp. 169-171, 6 figs. Illustrating methods of carrying out the various operations.

Granite-Block Pavements

How to Secure Best Results in Construction of Improved Granite Block Pavements. Eng. & Contracting, vol. 52, no. 14, Oct. 1, 1919, pp. 382-385. Standard sizes of blocks, laying of blocks, concrete base, sand or mortar cushion, ramming and grouting are among features discussed.

Road Impact Test

First Reports on Road Impact, E. B. Smith. Power Wagon, vol. 23, no. 179, Oct. 1919, pp. 27-29, 3 figs. Studies to determine destructive effect of heavily loaded motor trucks on highways and streets undertaken by Bureau of Public Roads at Arlington experimental farm.

See also MECHANICAL ENGINEERING, Motor-Car Engineering, Impact of Trucks and Roads

Water Pockets in Roadbed

Means for Prevention or Cure of Water Pockets in Roadbed. Bul. Am. Ry. Eng. Assn., vol. 21, no. 217, July 1919, pp 9-10. Recommendations proposed by Committee of Am. Ry. Eng. Assn.

SANITARY ENGINEERING

Refuse Collection

Street Cleaning and Refuse Collection in Newark. Mun. Jl. & Public Works, vol. 47, no. 13, Sept 27, 1919, pp. 200-202, 1 fig. Details of collection service, records of men and teams employed, amount and nature of work performed and personal efficiency. (Continued from p. 182.)

Sewer Inlets

More Engineering on Sewer Inlets, W. W. Horner. Mun. & County Eng., vol. 57, no. 4, Oct. 1919, pp. 147-150, 14 figs. Account of research work made by St. Louis engineers to determine intake capacity of different style inlet under various conditions of installation and particularly intake capacity of double inlet.

Sewage Treatment

Operating Results of "Direct Oxidation" Experimental Sewage Treatment Plant at Easton, Pa. Can. Engr., vol. 37, no. 16, Oct 16, 1919, pp. 389-393, 395 and 396. It was determined that combined action upon sewage of fine screen lime treatment and electrolytic cell rendered sewage in such a condition that after sedimentation in properly designed tanks affluent could be discharged into stream affording reasonable dilution of relatively clean water without danger of creating nuisance.

Sewers, Odors

Causes of Offensive Odors from Sewers and Remedial Measures, Edward B. Savage. Eng. & Contracting, vol. 52, no. 18, Oct. 29, 1919, pp. 511-512. Based on anemometer and other tests of ventilation system. Paper read before Inst. of Mun. and County Engrs.

WATER SUPPLY

Coagulating Basins

Some Observations and Experiences in the Operation of Coagulating Basins, James Wadsworth Armstrong. Can. Engr., vol. 37, no. 17, Oct. 23, 1919, pp. 405-407, 5 figs. Account of current measurements made with aluminum floats, readings of which were taken every five minutes.

Feedwater Treating

Feed-Water Treating and Purifying Plant for the Republic Iron & Steel Company, Youngstown, Ohio, S. H. McKee. Proc. Engrs.' Soc. Western Pa., vol. 35, no. 6, July 1919, pp. 283-301 and (discussion) pp. 302-309, 7 figs. Plant has treating capacity of 300,000 gal. per hr. and is laid out to permit 25 per cent extension.

Filtered Sand

Purification Effected by Mechanical Drifting Sand Filtration in Toronto, Norman J. Howard. Contract Rec., vol. 33, no. 41, Oct. 8, 1919, pp. 937-943; Can. Engr., vol. 37, no. 14, Oct. 2, 1919, pp. 342-345 and Eng. & Contracting, vol. 52, no. 15, Oct. 8, 1919, pp. 402-404, 15 figs. Average reduction said to have been 85.4 per cent in total bacteria and 94.8 per cent in b. coli during year 1918; chlorination killed practically all remaining bacteria.

Metalium Joints

Methods of Effecting Economies in Water Works Operation, Homer V. Knouse. Eng. & Contracting, vol. 52, no. 15, Oct. 8, 1919, pp. 405-406. Suggests special rigs and methods of handling work and use of metalium as jointing for pipe lines.

Water-Works Reconstruction

How to Reconstruct Small Water-Power Plants, Ray K. Holland. Mun. & County Eng., vol. 57, no. 4, Oct. 1919, pp. 180-182. Examples of plant reconstruction.

WATERWAYS

Stream Pollution

Stream Pollution and Its Relation to the Chemical Industries, Earle B. Phelps. Jl. Indus. & Eng. Chem., vol. 11, no. 10, Oct. 1, 1919, pp. 928-929. Suggests desirability of federal control of stream pollution under conditions that will permit of adequate scientific study of problems involved and of correlation of these problems with those of public health, navigation, fisheries, and other matters related to waterways.

HYDRAULIC ENGINEERING

Floods

Technical Study of the Propagation of Floods (Etude sur le mouvement graduellement varié non permanent et la propagation des crues), Edmond Maillet. Annales des Ponts et Chaussées, vol 50, no. 3, May and June 1919, pp. 289-331, 8 figs. Derivation of Baumgarten law.

Water Storage

The General Principles of the Development and Storage of Water for Electrical Purposes, J. W. Meares. Engineering, vol. 108, no. 2799, Aug 22, 1919, pp. 258-260, 5 figs. Comparative study of cost, both of installation and maintenance, of hydroelectric schemes and power house and steam power house. (Concluded.)

MUNICIPAL ENGINEERING

City Planning

The Planning of Residential Suburbs with Special Reference to Engineering Features, F. L. Olmsted. Mun. & County Eng., vol. 57, no. 4, Oct. 1919, pp. 161-164. Residential neighborhood plan under direction of U. S. Housing Corporation offered as example of engineering development.

Street Planning

Rules of Practice for the Establishment of Street Widths and their Subdivisions, B. A. Haldeman. Can Engr., vol. 37, no. 17, Oct. 23, 1919, pp. 409-410. Practice suggested by Zoning Commission, Philadelphia, Pa.

Zoning

Zoning, Edward M. Bassett. Can. Engr., vol. 37, no. 17, Oct. 23, 1919, pp. 410-411. Writer is chairman of zoning committee of New York City.

Mining Engineering

BASE MATERIALS

Clays

Clays and Shales of Minnesota, Frank F. Grout. Dept. of Interior, U. S. Geol. Survey, bul. 678, 1919, 259 pp., 38 figs. Object of investigation was to examine brick supply for every town of 1000 or more inhabitants and for every county in the state, to ascertain extent of various deposits now developed, to find new deposits, and to determine qualities of these deposits and of certain mixtures with a view to finding out whether it is possible to produce refractory wares, pottery, paving brick, and other high-grade products.

Clay Products Statistics in 1918. Cement, Mill & Quarry, vol. 15, no. 6, Sept. 20, 1919, pp. 41-43. Unusual conditions last year resulted in restricted operation of clay working industries, with consequent decrease in production.

Gravel

New Gravel Plant on Puget Sound, W. A. Scott. Cement, Mill & Quarry, vol. 15, no. 6, Sept. 20, 1919, pp. 11-13, 4 figs. Describing modern features at recently completed sand and gravel works of Independent Asphalt Paving Co., Seattle, Wash.

Phosphates

Investigation of a Reported Discovery of Phosphate in Alberta, Hugh S. de Schmid. Can. Dept. Mines, Mines Branch Bul. no. 12, 1916, 38 pp., 14 figs. partly on supp. plates. Area examined; nature of phosphate; analyses of samples of phosphate; results of examination of Rocky Mountain quartzite for phosphatic horizons; economic importance of deposits.

Coral Island Phosphates in the Making, F. Danvers Power. Bul. Instn. Min. & Metallurgy, no. 181, Oct. 16, 1919, 10 pp., 8 figs., on four supp. plates. Different shaping between phosphate deposited by animal or chemical means.

COAL AND COKE

Chemistry of Coal

Researches on the Chemistry of Coal—I. The Action of Pyridine upon the Coal Substance, William A. Bone and Reginald J. Sarjant. Proc. Roy. Soc., vol. 96, no. A-675, Sept. 4, 1919, pp. 119-136, 3 figs. Account of research carried out in Departments of Chemical Technology at Imperial College of Science and Technology, with object of clearing up various claimed discrepancies in work of previous investigators.

Coal Stocking

Coal Stocking and Reclaiming—I, II. Coal Trade Jl., vol. 50, nos. 40 and 44, Oct. 1 and 29, 1919, pp. 1195-1196 and 1266-1268, 7 figs. Oct. 1: Discusses deterioration in stocking, handling methods and machinery required. Oct. 29: Railroad large capacity plants are discussed.

Coal Washing

The Examination of Coal in Relation to Coal-Washing, M. Wynter Blyth and L. T. O'Shea. Trans. Instn. Min. Engrs., vol. 57, no. 5, Sept. 1919, pp. 261-276 and (discussion) pp. 276-288. Suggested method of testing. Ash in washed coal is taken as standard of purity by which to judge its suitability for coke making.

Coke-Oven Practice

Some Economic Considerations in Coke-Oven Practice, W. Colquhoun. Proc. Midland Inst. Min., Civil & Mech. Engrs., vol. 24, no. 7, Nov. 9, 1918, pp. 195-222 and (discussion) pp. 222-234, 6 figs. Comparison with beehive coke ovens develops that process of coking cannot be called economically perfect until, writer believes, some inventor devises more direct application of heat necessary to distill coal. General bibliography of technical articles on coking is appended.

Colliery Managers

The Education of Colliery Managers for Administrative and Social Responsibilities, William Maurice. Tran. Instn. Min. Engrs.,

vol. 57, no. 5, Sept. 1919, pp. 289-296 and (discussion) pp. 296-299. Importance of training colliery managers argued because of exceptional position in which they are placed, as illustrated by statistics which show that 1,500 managers control over 1,000,000 miners, these figures being interpreted as indicating extent of national influence that could be exerted if every manager made a point of rendering whatever form of social service was compatible with his temperament and abilities.

Fire Prevention

Fire Prevention in Anthracite Mines, M. W. Price. Coal Industry, vol. 2, no. 10, Oct. 1919, pp. 469-470. Equipment necessary for fighting mine fires and plans for organizing fire fighting squads at mining camps. Paper presented at 8th Annual Safety Congress.

Large-Scale Production

Engineering Features of Modern Large Coal Mines in Illinois and Indiana, C. A. Herbert and C. M. Young. Bull. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2445-2473, 10 figs. Important feature of development is production of coal by large consumers. Six mines planned for outputs of 6000 to 8000 tons per 8-hr. day are selected for discussion as exemplifying best practice in coal-mine engineering in central district at present time.

Low-Temperature Coking

New Method of Coking at Low Temperatures (Ueber eine neue zweckmässige Art der Durchführung der Tieftemperatur-Verkokung), Franz Fischer and W. Glund. Berichte der deutschen chemischen Gesellschaft, vol. 52, no. 6, 1919, pp. 1035-1039, 2 figs. Rotating cylinder used for distillation.

Power Plants

Some Useful Instruments for Colliery Power Plants, H. W. Ravenshaw. Proc. Midland Inst. Min., Civil & Mech. Engrs., vol. 24, no. 5, Mar. 9, 1918, pp. 141-151, 9 figs. D. c. and a. c. leakage recorders, over-volt vacuum-breaker, continuous steam engine indicator and apparatus for measuring orifices.

Purification of Coal

Purification of Coal, B. J. Roberts. Power Plant Eng., vol. 23, no. 20, Oct. 15, 1919, pp. 906-908. Concentration table method and results obtained.

Research

Research in the Coal-mining Industry, E. A. Holbrook. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1723-1737. Possible fields of research are pointed out, notably as to resources, origin, occurrence, constitution, development and exploitation.

Retort Tests

Experimental-Retort Tests of Orient Coal, R. S. McBride and I. V. Brumbaugh. Coal Age, vol. 16, no. 14, Oct. 2, 1919, pp. 567-569, 3 figs. Experiments conducted at Bur. of Standards in order to determine effect of coking temperature upon quantity and quality of gas produced.

Spitzbergen

Coal and Iron from the Arctic, Harold J. Shepstone. Sci. Am., vol. 120, no. 15, Oct. 11, 1919, pp. 362-363, 376 and 378, 5 figs. British syndicate reports finding iron mountain, 17 miles long, extensive coal beds and asbestos field at Spitzbergen.

Storage

A System of Storing and Filling Small Coal, with Remarks upon the Prevention of Spontaneous Heating in Coal Heaps, John Morison. Trans. North of England Inst. Min. & Mech. Engrs., vol. 68, no. 5, Apr. 1918, pp. 154-157 and (discussion) pp. 157-164, 3 figs. System of stocking by means of traveling cranes in use at Cramlington Collieries.

Sulphur in Coal

Sulfur in Coal. Geological Aspects, Geo. H. Ashley. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2073-2079. Modes of occurrence, and comparison of sulphur content in beds of various regions, noting how percentage of sulphur is controlled by conditions existing during laying down of each bed.

Forms in Which Sulfur Occurs in Coal, A. R. Powell and S. W. Parr. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2041-2049, 2 figs. Synopsis of investigation published as Bul. 111 (1919) of University of Ill. Eng. Experimental Station.

Effect of Sulfur in Coal Used in Ceramic Industries, C. W. Parmelee. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1845-1850. Figures showing maximum percentage of sulphur permitted in coal used by various companies in pottery ovens for manufacturing various kinds of clay products. Objections to sulphur are clinkering of fuel in firebox, action of oxides of sulphur in waste-heat driers, and effect of oxides of sulphur on clays, glazes and colors during burning and unburned clay products.

Occurrence and Origin of Finely Disseminated Sulfur Compounds in Coal, Reinhardt Thiessen. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2431-2444, 10 figs. It is reported that all coals that have been examined microscopically contain microscopic grains of pyrite disseminated through them, which are distributed very irregularly and usually occur in colonies. Microscopic pyrites and organic sulphur in coal are accounted for by same reasoning; lenses, balls, and sheets of pyrite are believed to have secondary origin.

Sulfur in the Coking Process, S. W. Parr. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1807-1809. Organic sulphur in coal, which is for the most part discharged at relatively low temperatures, is not considered as responsible for formation of CS_2 in gases discharged from high-temperature coking process.

Mechanical Separation of Sulfur Minerals from Coal, J. R. Campbell. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1779-1789, 4 figs. Plant where elimination of sulphur is accomplished by jigging in water and concentrating tables.

Testing of Coal

Testing of Coals for By-product Coking and Gas Manufacture, Horace C. Porter. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1587-1595, 3 figs. Writer believes it is possible by careful control of conditions, to judge both coking quality and by-product yields by laboratory carbonizing tests, giving weight in this judgment to approximate analysis of coal, nature of its volatile matter and its geologic history. Such a test, he advises, should be made comparative by choosing standard coal for known commercial performance.

Thick-Seam Working

New Methods of Working Thick Seams of Coal, Dudley S. Newey. Iron & Coal Trades Rev., vol. 99, no. 2689, Sept. 12, 1919, pp. 324-326, 13 figs. Advantages claimed are: complete extraction of coal, gradual and diminished subsidence, greater safety and improved conditions of work for miners, control of excessive weight, as well as better supervision.

Washability

Some Factors that Affect the Washability of a Coal, Thomas Fraser and H. F. Yancey. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1817-1827, 3 figs. From investigation and experimental research it is formulated as principal condition that characterizes easily washed coal that excess undesirable sulphur and ash should be present in form of shale or pyrite particles large enough to be detachable from coal without crushing finer than ¼ in. in size.

Wedging Holes

Wedging Diamond-drill Holes, O. Hall and V. P. Row. Bul. Am. Inst. Min & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1597-1602, 2 figs. Mond Nickel Co. follows standard practice of wedging holes back to vertical or back to straight line as soon as they show deflection of over 3 deg. This is accomplished by means of wooden plug, drive wedge, pilot wedge, deflecting wedge, special clinometer and special reaming bit.

West Virginia

Geographic Distribution of Sulfur in West Virginia Coal Beds, I. C. White. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 2197-2203, 8 figs. Including maps showing how percentages of sulphur in W. Va. coal are distributed geographically over State.

EXPLOSIVES

Shipping Containers

Shipping Containers, C. P. Beistle. Jl. Soc. Chem. Indus., vol. 38, no. 17, Sept. 15, 1919, pp. 330T-337T, 1 fig. Origin and present status of efforts of Bur. of Explosives to permit safety in transportation of dangerous articles.

See also ORGANIZATION AND MANAGEMENT, Safety Engineering (Explosives).

GEOLOGY AND MINES

Alaska

Mining Methods of Alaska Gastineau Mining Co., G. T. Jackson. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1547-1570, 14 figs. Deposits worked consist of single band, several hundred feet wide, in which stringers and veins of quartz carrying gold occur in slate formation near its contact with some altered volcanic rock. Article includes description of combination of shrinkage caving method of stoping used.

Canadian Springs

The Chemical Character of Some Canadian Mineral Springs—II, R. T. Elworthy. Can. Dept. Mines, Mines Branch. Bul. vol. 20, no. 472, 1918, 173 pp., 12 figs., partly on supp. plates. Classification of waters and methods of analysis; description of springs and tabulated analyses; relation of chemical constituents to geologic formations; therapeutics of mineral waters and economic value of springs.

See also Radioactivity, Canadian Springs.

High Temperatures in Deep Mines

High Temperatures in Deep Mines, William Garforth. Proc. Midland Inst. Min., Civil and Mech. Engrs., vol. 24, no. 8, Oct. 17, 1918, pp. 235-241. Examination of committee reports of various scientific societies on effects of working in atmosphere of high temperature and study of present systems of haulage and methods of working in deep mines.

Huronian Group, Michigan

Correlation of Formations of Huronian Group in Michigan, R. C. Allen. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2579-2594, 1 fig. Proposed amendments to U. S. Geological Survey correlations, prepared by C. R. Van Hise and C. K. Leith, in Geology of the Lake Superior Region, U. S. Geol. Survey Monograph 52.

Mesabi Range

The Nature and Origin of the Biwabik Iron-Bearing Formation of the Mesabi Range, Minnesota, Frank F. Grout. Economic Geology, vol. 14, no. 6, Sept.-Oct. 1919, pp. 452-464, 8 figs. Discussing precipitation, conditions of deposition, texture of deposit, primary modification of deposit and metamorphism.

Radioactivity, Canadian Springs

The Radioactivity of some Canadian Mineral Springs, John Satterly and R. T. Elworthy. Can. Dept. Mines, Mines Branch, Bul. 16, no. 435, 1917, 55 pp., 23 figs. on supp. plates. Methods used for determination of radioactivity; detailed description of apparatus; relation between radioactivity and other properties; description of wells and springs in various districts.

IRON

Great Britain

Recent Iron-Ore Developments in the United Kingdom, F. H. Hatch. Geol. Mag., vol. 6, no. 9, Sept. 1919, pp. 387-397, 2 figs. Table showing relative production and iron-content of Jurassic ironstones; analyses; statistics of production during 1918.

LEAD, ZINC, TIN

Elmore Process

The New Elmore Process. Min. & Sci. Press, vol. 119, no. 14, Oct. 4, 1919, pp. 479-480. Invention relates to extraction and separation of lead and zinc from ores, concentrates, and the like, in which these metals associated together in form of sulphites. It consists in treating ore, etc., with certain acid agents whereby lead sulphide is converted into soluble lead compound while zinc sulphide remains substantially unattacked.

Slag Melting

Slag Melting at Lead Works at Babe, Serbia (Ueber das Schlackenschmelzen in der Bleihütte des einstigen k. u. k. Militärbergbaues Babe in Serbien), Anton Lissner. Berg-und Hüttenmännisches Jahrbuch, vol. 67, no. 3, 1919, pp. 192-218, 6 figs. on supp. plate. Processes of melting, and results of operation.

Zinc Strip and Rod

Some Properties and Applications of Rolled Zinc Strip and Drawn Zinc Rod, C. H. Mathewson, C. S. Trewin and W. H. Finkeldey. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2775-2846, 57 figs. Survey of information on rolled zinc found in current literature, and study of characteristics of zinc from theoretical point of view. Several microstructures of typical specimens.

MINES AND MINING

Cementation Process of Shaft Sinking

Cementation Process of Shaft Sinking. Iron & Coal Trades Rev., vol. 99, no. 2692, Oct. 3, 1919, pp. 440-441. Particulars of bore holes for cementation, walling and sinking, and statement of costs. Paper read before North Staffordshire Inst. Min. Engrs.

Cost Keeping

Cost Keeping for Mines—III, K. D. Armstrong. Chem. Eng. & Min. Rev., vol. 11, no. 131, Aug. 5, 1919, pp. 319-322. Suggested system for time keeping.

Foremen

Law and the Dual Duties of Mine Foremen, Joseph J. Walsh. Coal Indus., vol. 2, no. 9, Sept. 1919, pp. 378-379, 2 figs. Application of anthracite mining law and dual duties of mine foreman are discussed; writer claims that campaign of education and enforcement of law have not produced desired results.

Mine Valuation

The Federal Taxation of Mines—II, L. C. Graton. Min. & Sci. Press, vol. 119, no. 16, Oct. 18, 1919, pp. 567-570. Methods of mine valuation.

Pit Props

The Strength of Pit-Props, Fred L. Booth. Trans. North of England Inst. Min. & Mech. Engrs., vol. 68, no. 5, Apr. 1918, pp. 165-169 and (discussion) pp. 169-176. Tables given of results of tests of crushing strength of various sizes of pit-props.

Rescue-Training Standardization

Standardizing Mine-Rescue Training, D. J. Parker. Coal Industry, vol. 2, no. 10, Oct. 1919, pp. 474-475. Historical account of development of self-contained breathing apparatus, especially as modified by researches of Bureau of Mines, and discussion of desirability and plan of mine rescue training. Paper read before Eighth Annual Safety Congress.

Settling Sumps and Filters

Notes on the Settlement of Mine Water on the Witwatersrand, J. Whitehouse. Jl. South African Instn. Engrs., vol. 18, no. 1, Aug. 1919, pp. 8-22, 9 figs. Describes details of settling sumps and filters installed on Village Deep Mine, and some points concerning their operation.

Shot Firing

Electric Shot-Firing, MM. Taffanel, Dautriche, Durr and Perrin. Quarry, vol. 24, no. 272, Oct. 1919, pp. 273-276, 7 figs. Experiments undertaken to investigate intensity at which misfire may occur when detonators are ranged in series, effect of excessive voltage, alternating versus direct current and effect of earth contacts or shunts.

See also Explosives.

Timber Treating

The Preservation of Mine Timber, N. T. Williams. Trans. Manchester Geol. & Min. Soc., vol. 36, no. 4, Sept. 1919, pp. 79-87, 4 figs., partly on supp. plate. Illustrating operation of open-tank plant for treating timber in hot and cold baths.

OIL AND GAS

Bore Holes

Graphic Charts for Petroleum Bore-Holes, T. Sington. Engineering, vol. 108, no. 2801, Sept. 5, 1919, pp. 321-322, 1 fig. Illustrating system of daily record of progress made as well as of accidents, water erosion and other difficulties incidental to petroleum search, which cause delay.

Dehydration of Oil

Electrical Dehydration of Oil, H. N. Sessions. Jl. Electricity, vol. 43, no. 7, Oct. 1, 1919, pp. 316-318, 2 figs. Instances quoted where it is said installation of electrical dehydrators at wells resulted in tremendous saving in transportation cost.

Gasoline in Natural Gas

Gasoline in Natural Gas, D. B. Dowling. Can. Dept. Mines, Geological Survey, Summary Report, 1918, part C, pp. 17C-42C, 1 fig. Account of absorption tests on Alberta Gas.

Prospecting

Geologic Factors in Oil Prospecting, Frederic H. Lahee. Economic Geology, vol. 14, no. 6, Sept.-Oct. 1919, pp. 480-490, 5 figs. Geologic factors governing conclusions enumerated as follows: Classification of rock formation, thickness percentage of rock types, relation to original shore lines, reservoir or sand conditions, structural conditions, depth to possible oil-bearing horizons, carbon ratio. All these are discussed.

Shales

The Oil Shales of Northwestern Colorado, Bur. Mines of State of Colorado, bul. no. 8, 1919, 59 pp., 5 figs. Noting commercial possibilities and precautions that must be taken in mining, including geological notes and general bibliography on oil shale industry.

Valuation of Oil Properties

Essential Factors in Valuation of Oil Properties, Carl H. Beal. Bull. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2219-2227. Factors discussed are (1) amount of oil property will produce, (2) amount of money this oil will bring, (3) development and production costs, (4) rate of interest on investment, (5) amortization of invested capital, and (6) scrap value of equipment when property is exhausted.

Metallurgy

ALUMINUM

Research

Aluminum Research (Untersuchungen über Aluminium), W. Jaeger and K. Scheel, and L. Holborn. Elektrotechnische Zeitschrift, vol. 40, no. 14, Apr. 3, 1919, pp. 150-152, 5 figs. Observations on the specific resistance and its temperature coefficients, on thermic expansion and tensile strength. The resistance coefficient in its relation to the structure and the chemical purity of aluminum.

IRON AND STEEL

Acid-Furnace Structure

The Action of Iron Oxides Upon the Acid-Furnace Structure, J. H. Whiteley and A. F. Hallimond. Iron and Steel Inst., meeting of Sept. 1919, paper no. 13, 21 pp., 10 figs. on 2 supplement plates. Method is outlined by which comparative amounts of oxides present in gases at various stages of open-hearth furnace operation may be ascertained. Various photomicrographs of solidified melts of silica and iron oxides are described.

Analysis, Steel

Analytical Chemistry Researches Relative to Steels (Recherches de chimie analytique relatives aux aciers), A. Travers. Annales de Chimie, vol. 11, July-Aug. 1919, pp. 17-128. Experiments covered (1) manner of effecting analysis of carbon by combustion, (2) analysis of sulphur by combustion in oxygen at temperature near 1200 deg. C, (3) investigation of method of manganese analysis by means of persulfate in presence of silver nitrate and (4) application in volumetry of titanium chloride as reducing agent.

Decarburization of Steel with Hydrogen

On the Decarburisation of Steel with Hydrogen, E. D. Campbell. Iron and Steel Inst., meeting of Sept. 1919, paper no. 3, 8 pp. Experiments conducted to determine best conditions under which small bars of commercial steels might be decarburized and effect of such decarburization on electrical resistivity of annealed bars. Results are interpreted to have indicated that pure carbides of iron are less stable and more completely dissociated when in solid solution than are carbides which are formed if other elements are present.

Effervescing Steel

Effervescing Steel, Henry D. Hibbard. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, supp. to Sept. 1919, pp. 2595-2608, 6 figs. Illustrating fractures of soft plate steel ingots and steel slabs.

Fuel Economy

Report on "Fuel Economy and Consumptions in the Manufacture of Iron and Steel," William A. Bone, Robert Hadfield and Alfred Hutchinson. Iron and Steel Inst., meeting of Sept. 1919, paper no. 2, 42 pp., 1 fig. Based on inquiries made as to practice in British iron and steel works by British Assn. Fuel Economy Committee.

German Practice

Analyzes German Iron Practice. Iron Trade Rev., vol. 65, no. 17, Oct. 23, 1919, pp. 1105-1109, 3 figs. Report of commission appointed by British ministry of munitions to visit steel works in Lorraine and in that part of Saar valley occupied by French authorities.

Manganese and Carbon Steels

On the Influence of Manganese on the Physical Properties of Carbon Steel, Tokujiro Matsushita. Sci. Reports of Tohoku Imperial University, vol. 8, no. 2, Aug. 1919, pp. 79-88, 5 figs., partly on supp. plates. Specimens tested were made by alloying metallic manganese from Kahlbaum with low-carbon steel and were tested in form of rods 20 cm long and 5 mm thick. From investigations it is concluded that structure of manganese steels is very similar to that of tungsten steels.

Manganese Steel

Manganese Steel Produced in Heroult Furnaces (Ueber Manganstahl und dessen Herstellung für Stahlformguss im Heroult-Elektroofen), Berthold Schudel. Schweizerische Bauzeitung, vol. 74, no. 11, Sept. 13, 1919, pp. 129-131. Describing method of charging and phenomena observed as regards tensile strength, etc.

Metallurgical Calculations

Modern Steel Metallurgical Calculations—III, Charles H. F. Bagley. Blast Furnace & Steel Plant, vol. 7, no. 10, Oct. 1919, pp. 502-505. Average analysis per 100 tons charged in (1) acid open-hearth process with 50 per cent iron and 50 per cent scrap and (2) basic open-hearth process with 50 per cent common forge iron and 50 per cent steel scrap.

Nickel Steel

Some Experiments on Nickel Steel, N. Hudson. Iron and Steel Inst., meeting of Sept. 1919, paper no. 9, 13 pp., 1 fig. Undertaken to determine whether nickel in nickel steel would combine with carbon monoxide to form nickel carbonyl gas in a manner similar to that in Mond process for purification of nickel.

Reactions, Balanced

Balanced Reactions in Steel Manufacture, Andrew McCance. Trans. Faraday Soc., vol. 14, no. 3, July 1919, pp. 213-223 and (discussion) pp. 224-227, 1 fig. Question is studied from standpoint of physical chemistry, and connection between final quality of solid steel and antecedent conditions during manufacture is traced with special reference to contained gases. Writer deals mainly with open-hearth process.

Slag Inclusions

Slag Inclusions. Trans. Faraday Soc., vol. 14, no. 3, July 1919, pp. 188-190, 21 figs. on five supp. plates. Photomicrograph showing longitudinal and transverse sections in wrought-iron bars of various qualities. Bibliography on occluded gases is appended.

Steel Alloys

Engineering Science Before, During and After the War, Charles A. Parsons. Science, vol. 50, no. 1293, Oct. 10, 1919, pp. 333-338. Extensive use of alloys of steel is specially noted. (To be continued.) Address of President of British Assn. for Advancement of Sci.

Sulphur in Malleable Iron

Sulphur Reduced in Malleable Iron, A. W. Merrick. Foundry, vol. 47, no. 16, Oct. 1, 1919, pp. 685-687, 3 figs. Cupola metal refined in electric furnace. Sulphur is lowered by reducing slag containing calcium carbide. Advantages of duplexing process are considered.

Temperatures

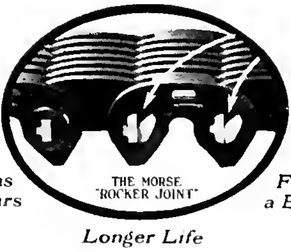
Electric, Open-hearth, and Bessemer Steel Temperatures, F. E. Bash. Bul. Am. Inst. Min. & Metallurgical Engrs., no. 153, Sept. 1919, pp. 1739-1750, 3 figs. For purpose of comparison, tapping temperatures of two 25-ton Heroult electric furnaces and one 6-ton with one 50-ton acid, one 40-ton basic, and one 65-ton acid open-hearth, all making nickel ordnance steel for guns are given.

Woody Fractures

On the Woody Structures of Fractures of Transverse Test-Pieces taken from Certain Special Steels, J. J. Cohade. Iron and Steel Inst., meeting of Sept. 1919, paper no. 4, 15 pp., 7 figs. It is concluded from experimental research work that forging finished at a high temperature improves results of transverse tests, although not to a great extent. Hence it is recommended that if very good results are sought it is preferable to diminish percentage of carbon below 5.30 per cent, if the percentage of nickel has to be increased in order to obtain necessary tensile strength after quenching.

The Drive of Efficiency *The Drive of Durability*

MORSE CHAINS



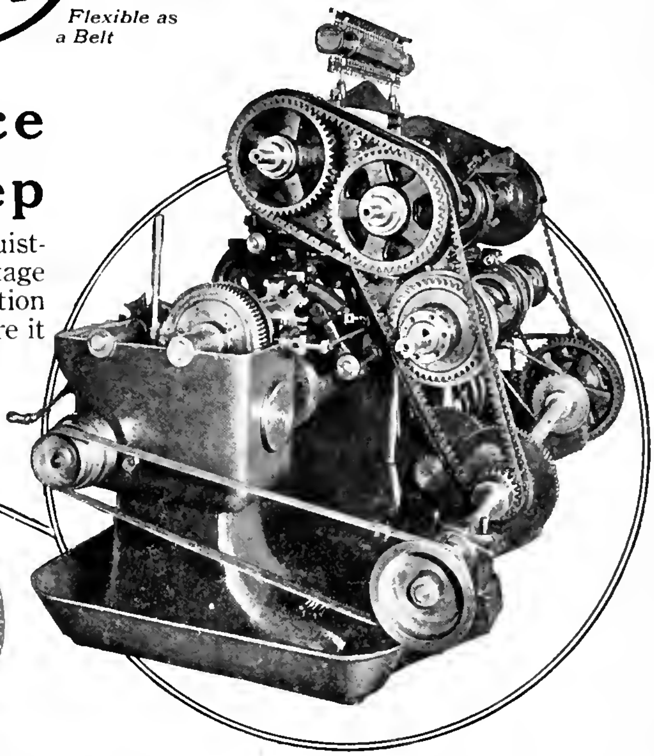
Positive as Gears *Flexible as a Belt*

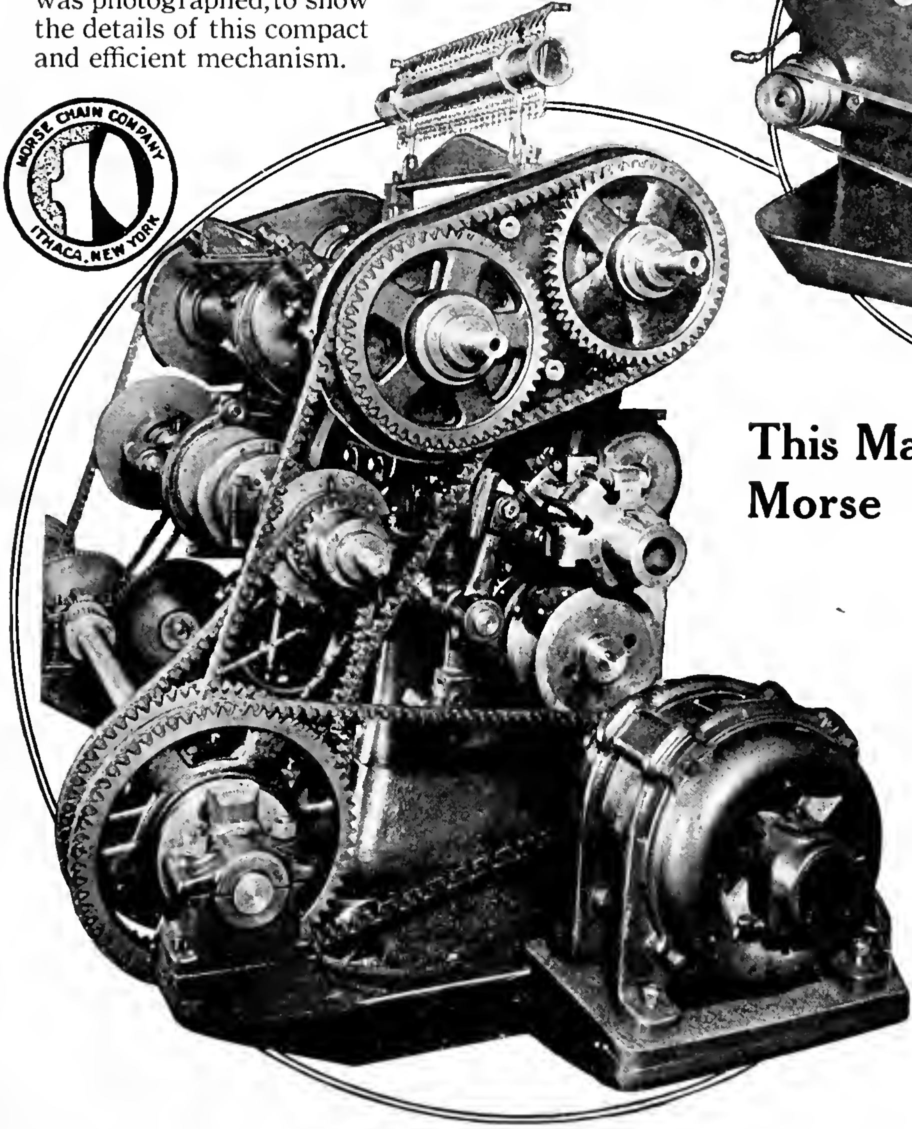
Longer Life

For Economy in Space and Economy in Upkeep

This automatic hub boring machine, built by the Blomquist-Eck Machine Co., of Cleveland, Ohio, shows to advantage the application of Morse Silent Chain to speed reduction in small power drives. All guards were removed before it was photographed, to show the details of this compact and efficient mechanism.

MORSE CHAIN COMPANY ITHACA, NEW YORK





This Machine is Driven with Morse Chain Throughout

Seven Morse Silent Chains—.9″ pitch, 1″ face—transmit power from a 10 H. P. motor to and through this mechanism.

In some cases they eliminate intermediate gears; in others, bevel gears, shafts, brackets and other units which take up more space and deteriorate more rapidly.

This machine has given five years of complete satisfaction to its owners and is good for many more The patent "Rocker Joint" reduces wear to a minimum. Easy to take up wear, when necessary. Consult us when planning important drives—large or small.

MORSE CHAIN CO., LARGEST MANUFACTURERS OF SILENT CHAINS IN THE WORLD ITHACA, N. Y.

Aeronautics

AEROPLANE PARTS

Starters

The Liberty Starter. Aerial Age, vol. 10, no. 3, Sept. 29, 1919, pp. 88 and 89, 3 figs. Design is single compact unit enclosing both hand and electric starting.

AUXILIARY SERVICE

Pumps, Fuel

Wind-Driven Petrol Pumps for Aeroplanes. Engineering, vol. 108, no. 2799, Aug. 22, 1919, pp. 239-240, 8 figs. Types constructed by Vicker's, Ltd. Air screw and pump impeller are mounted on same shaft, which is of steel, case-hardened and ground, and runs in pair of ball bearings. Impeller, which is of aluminum with radial vanes, is pinned to shaft and runs in bronze casting that forms volute chamber and also carries suction and delivery connections.

DESIGN

Performance

Prediction of Aeroplane Performance, I. M. Laddon. Flight, vol. 11, no. 41, Oct. 9, 1919, pp. 1342-1343, 1 fig. Method based in comparing performance of airplane under investigation with actual performance of similar type on a power and surface-loading basis.

Radiators

Radiator Position, R. F. Mann. Flight, vol. 11, no. 41, Oct. 9, 1919, pp. 1338-1340, 5 figs. Position as determined by necessity of varying effective area during flight and other requirements radiator must fulfil in relation to other parts of engine and operations of aviator.

Resistance

The Horsepower of Resistance in Airplane Design, N. L. Lieberman. Jl. Soc. Automotive Engrs., vol. 5, no. 3, Sept. 1919, pp. 252-261, 9 figs. Formulæ and graphs establishing conditions of fluid motion, and discussion of relation between theoretical conclusions, laboratory models and full-scale findings. (To be concluded.)

DYNAMICS

Climbing

Theory of Airplanes (Théorie des aéroplanes), M. Rateau. Aeronautique, vol. 1, no. 4, Sept. 1919, pp. 146-151, 1 fig. Formula establishing that ascensional velocity when climbing under maximum angle is inversely proportional to square root of specific weight of air. (Continuation of serial.)

ENGINES

Vibration

Airplane Engine Vibration—II, Glenn D. Angle. Aviation, vol. 7, no. 5, Oct. 1, 1919, pp. 212-216, 19 figs. Writer discusses torque reaction, variation in torque, showing torque curves for one to eighteen-cylinder engines. (Concluded.)

INSTRUMENTS

Air-Speed Indicators

Air Speed Indicators for Dirigibles. Jl. Franklin Inst., vol. 188, no. 4, Oct. 1919, pp. 535-544, 10 figs. Description of two forms of air speed indicator developed by Aeronautics Staff of U. S. N., both based on double-throat venturi, but made waterproof by shielding smaller inner venturi from direct impact of drops or spray.

METEOROLOGY

Cyclones

The Travelling Cyclone, Lord Rayleigh. Lond., Edinburgh, and Dublin Phil. Mag., vol. 38, no. 225, Sept. 1919, pp. 420-424, 1 fig. General problem is studied analytically in two dimensions, starting from usual Eulerian equations.

Electrical Phenomena

Electrical Phenomena in the Upper Atmosphere—I, S. Chapman. Sci. Am. Supp., vol. 88, no. 2282, Sept. 27, 1919, pp. 198-199 and p. 202. Electrical phenomena occurring in stratosphere and above levels of instrumental observation. (To be continued.) From Instn. Elec. Engrs., London.

Meteorological Information

The Supply of Meteorological Information, H. G. Lyons. Aeronautical Jl., vol. 23, no. 103, July, 1919, pp. 397-406, 1 fig. In order to efficiently and economically issue forecasts and weather maps, wide and prompt cooperation, careful coordination of effort and ready sharing of all information are said to be necessary.

PLANES

Cato

The Cato Sporting Monoplane. Flight, vol. 11, no. 41, Oct. 9, 1919, pp. 1334-1336, 5 figs. Sporting machine. General specifications are: Overall span, 28 ft. 11½ in.; overall length 20 ft. 10 in.; weight fully loaded, 727 lb., climb in 10 min. 4500 ft.; ceiling 1200 ft.

Hospital Aeroplanes

Hospital Airplanes (Avions sanitaires). Aeronautique, vol. 1, no. 4, Sept. 1919, pp. 129-132, 10 figs. Special design of fuselage to carry wounded, and provided with radio-surgical apparatus and medical supplies.

Oertz

The Oertz Flying Boats. Flight, vol. 11, no. 41, Oct. 9, 1919, pp. 1345-1349, 10 figs. Made in two types, biplane and tandem biplane; both are fitted with Maybach engines of from 150 to 240 hp. in single biplane and two 240 hp. in tandem.

Westland

The Westland Limousine Aeroplane. Engineer, vol. 128, no. 3325, Sept. 19, 1919, pp. 271-272 and 280, 21 figs., partly on supp. plates. Fuselage is much broader and deeper than usual. Machine is capable of carrying 3 passengers and pilot or 500 to 600 lb. of mail.

PROPELLERS

Variable-Pitch Propellers

Variable Pitch Propellers (Verstellbare Luftschrauben), C. Eberhardt. Motorwagen, vol. 22, no. 18, June 30, 1919, pp. 309-313, 4 figs. Since opinions as to necessity of variable pitch propellers differ, writer attempts to clarify this question by calculating first of all tractive power of propeller necessary for horizontal flight of a given machine at various heights and to present it graphically, basing his calculations on Kann's theory of ascension. (To be continued.)

TESTING

Altitude Laboratory

Altitude Laboratory for the Testing of Aero Engines, H. C. Dickinson and H. G. Boutell. Flight, vol. 11, no. 42, Oct. 16, 1919, pp. 1378-1380, 4 figs. Aerial Age, vol. 10, no. 3, Sept. 29, 1919, pp. 85-87 and 97, 7 figs. For measuring horsepower and brake mean effective pressure at full throttle for various conditions, mechanical losses, heat distribution, exhaust gas analysis, oil consumption and distribution, carburetor performances and low air pressures and temperatures as affecting performances of engines and accessories.

Marine Engineering

SHIPS

Deadweight Carrier

What Constitutes a Good Deadweight Carrier? Shipbuilding & Shipping Rec., Sept. 25, 1919, pp. 7-9. Factors affecting selection of size, form, type and structure, derrick arrangement, and propelling machinery.

Diesel-Engine Drive

Trawler Has Gas-Electric Drive, Herbert R. Simonds. Mar. Rev., vol. 49, no. 11, Nov. 1919, pp. 503-505, 5 figs. Two 8-cylinder Diesel engines are direct-connected to generators which energize motor driving propeller shaft.

Drive for Wooden Ships

Diesel Engine, Electric Drive planned for Wooden Ships. Mar. News, vol. 6, no. 6, Nov. 1919, pp. 158-159, 5 figs. Plan of Winton Engine Works, Cleveland, Ohio, consists of removing from wooden steamers of U. S. Shipping Board reciprocating engines and other equipment now in them, replacing these with Diesel engines operating electric generators.

Geared Turbines

Geared Turbine Propelling Machinery of H. M. S. "Raleigh." Engineering, vol. 108, no. 2802, Sept. 12, 1919, pp. 340-341 and 344, 6 figs. Machinery is of Brown-Curtis type, having four shafts, each of which is driven by a high-pressure and low-pressure turbine through single-reduction gearing.

Propellers

Propeller Data from U. S. S. New Mexico's Trials, S. M. Robinson. Jl. Am. Soc. Naval Engrs., vol. 31, no. 3, Aug. 1919, pp. 598-614, 9 figs. Two sets of trials were held—one when ship had been out of dock about seven weeks and one just after she had been docked. A difference between two trials of about 4250 shaft horsepower at 21 knots was obtained due to foul condition of ship's bottom. From this and similar experiences with other ships it is noted that fouling occurs very rapidly in first few weeks that a ship is out of dry dock.

Propulsion

The Passing of the Direct-Connected Turbine for the Propulsion of Ships, C. W. Dyson. Jl. Am. Soc. Naval Engrs., vol. 31, no. 3, Aug. 1919, pp. 555-576, 4 figs. Tables and graphs showing comparative steam economy of turbines and reciprocating engines in warships of various types. Difference is decidedly in favor of Parsons installations except where geared cruising element is used, in which case Curtis installation with medium-speed propeller is seen to be slightly superior from 10½ knots down.

See also Geared Turbines, Diesel-Engine Drive, Drive for Wooden Ships.

YARDS

Burntisland Company Yard

The New Shipyard of the Burntisland Shipbuilding Company, Limited. Shipbuilding & Shipping Rec., Sept. 25, 1919, pp. 12-16, 6 figs., partly on supp. plates. Notes on yard equipment and machinery; also details of 300-ft., 6000-ton vessels being built for French Wine Trade.

Shipways

New Shipways at Newport News Departure from Ordinary Practice, A. F. Mattson. Eng. & Contracting, vol. 52, no. 17, Oct. 22, 1919, pp. 462-463, 1 fig. Chief departure from ordinary is location of lower portion of incline plane partly below mean water level, this portion to be pumped out and kept free from water during entire time of construction of ship.

Welding

Electric Welding in Steel Ship Building, George R. Cooley. Pac. Mar. Rev., vol. 16, no. 10, Oct. 1919, pp. 102-103, 5 figs. Illustrating process of welding angle iron corners.

Railroad Engineering

ELECTRIC RAILROADS

Armature Leads Breakage

Preventing the Breakage of Armature Leads on Railway Motors, A. L. Broomall. Elec. Jl., vol. 16, no. 10, Oct. 1919, pp. 440-443, 1 fig. Methods for overcoming trouble by (1) reducing vibration, or (2) increasing resistance of armature leads so that these can resist vibration, are classified and discussed.

Emergency Car

Emergency Car for Electric Railways (Störungswagen für elektrische Bahnen), H. Uhlig. Elektrische Kraftbetriebe u. Bahnen, vol. 17, no. 14, May 14, 1919, pp. 105-106, 1 fig. Principal requirements of such a car said to be: Independence from tracks; radius of at least 100 km.; and must be equipped for handling derailment, collisions, overhead line trouble, as well as for caring of wounded. Such a design is described.

Freight Haulage

Electric Railway Freight Haulage, A. B. Cole. Elec. Jl., vol. 16, no. 10, Oct. 1919, pp. 453-456, 6 figs. Economical value discussed and organization suggested.

Operation

Electric Railway Passenger and Freight Transportation, C. E. Morgan. Elec. Jl., vol 16, no. 10, Oct. 1919, pp. 422-426, 4 figs. Observes that electric railways are not generally operated to fullest capacity inasmuch as they do not operate either freight or passenger service between midnight and 5 A.M. and urges managers to develop their freight business to such a point that there will be no portion of the 24 hours of the day during which railways are not productive.

ELECTRIFICATION

Spain

Electrification of Spanish Railways (Electrificacion de los ferrocarriles espanoles), D. Luis Sánchez Cuervo. Revista de Obras Publicas, vol. 67, nos. 2294, 2295 and 2296, Sept. 11, 18 and 25, 1919, pp. 449-453, 464-469 and 275-480. Sept. 11: Technical aspect of problem. Sept. 18: Question of whether electrically operated systems are dependable to give steady service; comparison in this respect with steam roads. Sept. 25: Traffic in Spanish railways is considered as too reduced to permit their economical electrification.

EQUIPMENT

Inspection

The Inspection and Construction of Modern Carriage and Wagon Stock. Ry. Engr., vol. 40, no. 477, Oct. 1919, pp. 220-224; 3 figs. English practice of inspection and specifications of steel-rolled sections and plates used for underframe members of rolling stock. (To be continued.)

Standardization of Equipment

Standardization of Railway Equipment. Ry. Rev., vol. 65, no. 15, Oct. 11, 1919, pp. 534-536. Views of railway supply trade as expressed to Congress.

Standardization of Painting

Standardized Painting of Railroad Equipment, W. A. Buchanan. Ry. Rev., vol. 65, no. 14, Oct. 4, 1919, pp. 491-493. Outline of plan of painting of equipment as practiced on Delaware, Lackawanna & Western Railway. Suggestions in regard to stenciling of equipment are included.

LOCOMOTIVES

Dutch Express Locomotives

New Dutch Express Locomotives (De snelreinlocomotieven Serie 71/78 der Nederl. Centraal Spoorweg-Maatschappij), J. H. Gehlen. Ingenieur, vol. 34, no. 31, Aug. 2, 1919, pp. 565-570, 9 figs. Eight engines of following characteristics were supplied before war by German firm to Dutch Central Ry.: Four 15¾ in. by 25¾ in cylinders; tractive force 20,300 lb.; total weight 70 tons; working steam pressure 174 lb.

OPERATION AND MANAGEMENT

Train Resistance

Passenger Train Resistance, Edward C. Schmidt and Harold H. Dunn. Univ. of Illinois Bull., vol 16, no. 15, Dec. 9, 1918, 44 pp., 11 figs. Results of experiments made with passenger trains throughout their ordinary range of speed.

Vibration

Apparatus for the Registration of Oscillations of Railway Material to Judge Cars and Track (Toestellen voor het aanteekenen van slingeringen van spoorwegmaterieel en het gebruik voor de beoordeeling der voertuigen en van het spoor), E. Bolleman Kijlstra. Ingenieur, vol. 34, no. 37, Sept. 13, 1919, pp. 672-681 and (discussion) pp. 681-682, 31 figs. Description of Rossignol, Sabouret, van Schlick and other designs.

RAILS

Standard Open-Hearth and Bessemer-Steel Rails. Assn. Am. Steel Manufacturers pamphlet, July 7, 1915, 16 pp. Standard specifications.

SHOPS

Automatic Tools

Automatics in Railroad Shops, M. H. Williams. Mech. World, vol. 66, no. 1711, Oct. 17, 1919, pp. 183-184, 5 figs. Automatic machines are divided into three classes: Single-spindle machines in which one bar is worked on at a time; multiple-spindle machine on which four or more bars are worked on at one time; and automatic chucking machine used for machining castings and forgings. Machines of these types are illustrated. (To be continued.)

Baltimore and Ohio Shops

Baltimore & Ohio Shops, Cumberland, Md. Ry. Rev., vol. 65, no. 16, Oct. 18, 1919, pp. 557-559, 4 figs. For handling heavy locomotive repairs. Special feature is grain equipment which makes it possible to handle by power all work passing into and through shops.

Blacksmith Shop

The Up-to-Date Railroad Blacksmith Shop, George Fraser. Ry. Rev., vol. 65, no. 14, Oct. 4, 1919, pp. 490-491. Outlines essential features of modern railway blacksmith shop including specially those required by structure in which department is housed as well as those pertaining to modern furnaces and forging machines and their arrangement.

Flue Replacement

Flues—III, IV and V, George L. Price. Boiler Maker, vol. 19, nos. 6, 7 and 8, July and Aug. 1919, pp. 154-156, 199-201 and 242-245, 4 figs. Method of removing and replacing set of flues in locomotive boiler; work done in roundhouse. Precautions observed in expanding flues; method of removing scale; applying arch tubes; welding superheater tubes.

STREET RAILWAYS

Controls

Automatic HL Control for Boston Surface Cars, A. D. Webster. Elec. Jl., vol. 16, no. 10, Oct. 1919, pp. 459-464, 10 figs. Installation provides for multiple unit operation for side cars where private right-of-way is employed in more congested districts.

Gasoline-Motor Traction

Gasoline vs. Electric Motors, N. W. Storer. Aera, vol. 8, no. 3, Oct. 1919, pp. 375-378. Elec. Ry. Jl., vol. 54, no. 15, Oct. 11, 1919, pp. 27-29. Oct.: Study of their respective merits for street railway service. Oct. 11: Writer believes present gasoline motors cannot compete with electric motor as railway motive power because of greater depreciation of gasoline equipment than that of electric equipment and because electric motors excel in low-maintenance cost. Paper read before Am. Elec. Ry. Assn.

Locomotives

Comparison of Low-Speed and High-Speed Interurban Freight Locomotives, D. C. Hershberger Elec. Jl., vol. 16, no. 10, Oct. 1919, pp. 436-440, 5 figs It is concluded that adequate energy supply and service to be performed are factors which influence locomotive of proper speed characteristics and hauling capacity.

Management

Transportation and Traffic Problems, Luke C. Bradley. Stone & Webster Jl., vol. 25, no. 4, Oct. 1919, pp. 275-282 Concerning various details of management.

Municipal Operation

Municipal Railway Operation at Seattle, Washington, Thomas F. Murphine. Elec. Jl., vol. 16, no. 10, Oct. 1919, pp. 428-430. Résumé of operating receipts for the first quarter of 1919 during which time the city has operated its railway system, fare being kept at 5 cents.

One-Man Cars

Are High Costs of Service Likely to Develop Permanent Competition? L. H. Palmer. Elec. Ry. Jl., vol. 54, no. 15, Oct. 11, 1919, pp. 11-13. Suggests use of one-man cars and adoption of zone system of fare collection. Paper read before Am. Ry. Assn.

Safety Car

The Safety Car, N. H. Callard, Jr. Elec. Jl., vol. 16, no. 10, Oct. 1919, pp. 447-452, 6 figs. Figures and experiences of various cities quoted in proof of assertion that "safety car" permits increased service without increasing cost of operation.

Service with the Safety Type Car, E. A. Palmer. Elec. Jl., vol. 16, no. 10, Oct., 1919, pp. 426-428, 1 fig. Advantages of safety car specially noted are said to be: (1) reduction of accidents, (2) faster schedule speed and increased service with same number of cars, (3) satisfaction of city government and operators, and (4) reduction in rolling equipment maintenance.

Safety Car Scores a Success in Kansas City, P. J. Kealy. Elec. Ry. Jl., vol. 54, no. 15, Oct. 11, 1919, pp. 31-36. Testimonials of operating men, manufacturers and consulting engineers on what frequent service car has accomplished and may be expected of it in reducing cost and increasing revenues. Abstracts of papers presented before meeting of Transportation and Traffic Assn.

TERMINALS

Freight Terminal

Minor Buildings of a Large Freight Terminal. Ry. Rev., vol. 65, no. 14, Oct. 4, 1919, pp. 481-483, 5 figs. Plans and illustrations of frame structures adopted to office purposes and convenience and public welfare of employees engaged in operating yards.

Locomotive Handling

Caring for Locomotives at Terminals. Ry. Rev., vol. 65, no. 14, Oct. 4, 1919, pp. 483-490, 18 figs. Committee report read at Convention of Travelling Engineers' Assn.

General Science

CHEMISTRY

Adsorption

Studies of the Adsorption of Gases by Charcoal—1, Harvey Brace Lemon. Phys. Rev., vol. 14, no. 4, Oct. 1919, pp. 281-292, 8 figs. Variations due to heat treatment examined for case in which mass of air used was less than that required to saturate charcoal.

Analysis

An Improved method for Determination of Carbon by Wet Combustion, Using Barium Hydroxide as Absorbent, P. L. Hibbard. Jl. Indus. & Eng. Chem., vol. 11, no. 10, Oct. 1, 1919, pp. 941-943. Substance is heated in Kjeldahl flask with chromic anhydride and sulfuric acid whereby carbon is oxidized to carbon dioxide which is carried into solution of barium hydroxide by current of purified air; after reaction is completed excess of barium hydroxide is determined by titration with standard hydrochloric acid.

Catalysis

A Study of Catalytic Actions at Solid Surfaces—I. Hydrogenation of unsaturated Fats in the Liquid State in Presence of Nickel, E. F. Armstrong and T. P. Hilditch. Proc. Roy. Soc., vol. 96, no. A-675, Sept. 4, 1919, pp. 137-146, 2 figs. Comparison of behavior of unsaturated fatty oils towards hydrogen in presence of finely disseminated nickel, with that of glucosides, towards water in presence of enzymes.

PHYSICS

Acoustics

Engineering Science Before, During and After the War—II, Charles A. Parsons. Science, vol. 50, no. 1294, Oct. 17, 1919, pp. 355-362. Account of development of sound-range and listening devices. (To be concluded.)

Propagation of Sound in an Irregular Atmosphere, G. W. Stewart. Phys. Rev., vol. 14, no. 4, Oct. 1919, pp. 376-378. Under poor atmospheric conditions lower frequencies in aeroplane engine sounds become relatively enhanced; under good conditions frequencies of order of 1000 d. v. are heard at greatest distances.

Electricity

Several Problems Relative to Polymorphous Transformation. (Sur quelques problèmes relatifs aux transformations polymorphiques.) F. Guéry. Revue Générale de l'Electricité, vol. 6, no. 10, Sept. 6, 1919, pp. 291-297, 9 figs. Technical discussion of possibilities (1) to transform alternating current into direct current or vice versa by electromagnetic induction, (2) to construct a synchronous motor without commutator, and (3) to transform current of given frequency into one of any other frequency and the frequency of which may be varied without a commutator.
